

Über dieses Buch

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

Nutzungsrichtlinien

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

Wir bitten Sie um Einhaltung folgender Richtlinien:

- + *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.
- + *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.
- + *Beibehaltung von Google-Markenelementen* Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.
- + *Bewegen Sie sich innerhalb der Legalität* Unabhängig von Ihrem Verwendungszweck müssen Sie sich Ihrer Verantwortung bewusst sein, sicherzustellen, dass Ihre Nutzung legal ist. Gehen Sie nicht davon aus, dass ein Buch, das nach unserem Dafürhalten für Nutzer in den USA öffentlich zugänglich ist, auch für Nutzer in anderen Ländern öffentlich zugänglich ist. Ob ein Buch noch dem Urheberrecht unterliegt, ist von Land zu Land verschieden. Wir können keine Beratung leisten, ob eine bestimmte Nutzung eines bestimmten Buches gesetzlich zulässig ist. Gehen Sie nicht davon aus, dass das Erscheinen eines Buchs in Google Buchsuche bedeutet, dass es in jeder Form und überall auf der Welt verwendet werden kann. Eine Urheberrechtsverletzung kann schwerwiegende Folgen haben.

Über Google Buchsuche

Das Ziel von Google besteht darin, die weltweiten Informationen zu organisieren und allgemein nutzbar und zugänglich zu machen. Google Buchsuche hilft Lesern dabei, die Bücher dieser Welt zu entdecken, und unterstützt Autoren und Verleger dabei, neue Zielgruppen zu erreichen. Den gesamten Buchtext können Sie im Internet unter <http://books.google.com> durchsuchen.

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

OCCASIONAL NOTES.

IN a pamphlet published in 1733, entitled "The Budget opened," Sir R. Walpole was compared, *à propos* of his forthcoming Excise Bill, to a mountebank opening his wallet of quack medicines and conjuring tricks, whence (as "The English Dictionary" informs us) the word "Budget" has passed into every European language. Like the author of the pamphlet, we do not pretend to understand this Art of political legerdemain, or to know what our State empirick will dispense. The *primum mobile* of politics is beyond our ken, and our horoscope is confined to the sublunary sphere of education. First, then, we may note that (as set forth in another column) the new Local Authorities throughout England are strenuously applying themselves to the task set them, and working out the problem both of primary and secondary education. Rates have risen in consequence, and without a liberal Treasury grant in aid there is grave danger of reaction in favour of economy, of arrested energies, and starved foundations. Provision for the training of teachers as a national and not a local concern is a part of the burden that the State might well take on its shoulders. The hopeful sign of the times is the acknowledgment in all public utterances that teachers are underpaid. From this to adequate salaries is a far cry, but we have little doubt that in founding new secondary schools some such scale as that suggested by Mr. Sadler will be adopted by the larger County and Borough Councils. It will be seen that a well equipped and well staffed school is a greater boon to the public than a wilderness of minor scholarships. One matter that cannot be let slide for another year, whatever Government is in office, is the Teachers' Register. In March the present Registration

Council dies a natural death, and a new Council will have to be constituted. The Board of Education must give an account of its stewardship, and explain why it has so far made no endeavour to fulfil the duty laid upon it by the Act of 1899, and frame an alphabetical list of qualified teachers to be published annually. We reserve further remarks on this subject till the annual Report of the Registration Council appears. Another matter on which the Board will in the course of the year be bound to pronounce an opinion is the scheme of leaving certificates. It has gained time by a general *referendum*, but it is now bound itself to pass judgment. We have good reason for saying that the general lines of the scheme have been approved by professional opinion, and it now rests with the Board to give effect to the recommendations of the Consultative Committee, and end the chaos of conflicting examinations. Will 1905 see a Federation of Associations of Secondary Teachers? We confess the auguries do not seem to us hopeful. The Head Masters' Conference referred the matter to its Committee without any recommendation, and there is little doubt that it will stand aloof. Had such a Federation been in existence ten years ago, it might have guided public opinion and influenced legislation; but it is a day too late. There can never be the same solidarity among secondary as there is among primary teachers; the party wall between primary and secondary is being sapped, and a body from which technical teachers are excluded must be lopsided. The religious question looms large, but we believe it to be a Spectre of the Brocken which will fade away in the light of common day. It does not exist in our Secondary schools, nor does it greatly trouble educationists who, like the late Mr. Rogers of Bishopsgate, mean business. Our auguries for the New Year are favourable. "Be strong and of good courage" is the watchword wherewith we greet our readers.

THERE was an atmosphere of fog in the Assembly Hall at Horsham which was not dispelled by the light of our leaders. A ribald wit in the smoking room suggested as a subject for the second day's debate whether the Head Masters had produced the fog or the fog the Head Masters. Their attitude was one of cautious conservatism, and, like the Chancellor in the "Sleeping Palace," they "smiling put the question by." "That it be referred to the Committee," or "to a committee to be appointed by the Committee," was the preamble or a rider to each resolution. Even the proposals of the Consultative Committee for a system of school certificates, which were communicated to the Conference in June with a request from the Board of Education to send in criticisms not later than December 31, shared the common fate. It would be rash haste, so our Nestors held, to approve or disapprove off-hand so grave and complicated a measure. And in the debate the two leading principles of the scheme which have seemed to us to mark the path of true progress—the combination of examination with inspection and the association of the internal with the external examiner—found little support. The one matter on which the Conference had a definite opinion, and were not afraid to pronounce it, was the retention of Greek. Mr. Lyttelton would have been willing to grant the science man an option of more science, that is, to encourage that premature specialization, to which the leaders of science are no less opposed than the humanists, and Dr. James was shocked to find that preparatory schools are dropping Greek, though there is not an educationist who would now defend the simultaneous beginning of the study of three foreign languages. The plain fact is that the Head Masters' Conference is a dining club. As such it is

not only pleasant, but profitable for mutual instruction, and those who as guests have been permitted to share its genial hospitality would be loth to see it abolished. But it is no more a force in national education than the "U.U.," that mystic guild of assistant masters, and the time is surely ripe for its absorption in the more democratic and far more vigorous I.A.H.M. It reminds us of an old country nobleman who was asked whether he often attended the House of Lords. "No," he replied, "I went up to vote against Gladstone's Home Rule Bill, but I caught a bad cold, and I have not been since."

"MAJOR pars meliorem vicit," and, as we anticipated last month, Congregation by 200 votes to 164 rejected the *placet* of Convocation permitting alternatives to Greek for Honourmen in Mathematics and Science. We need not recur to the arguments of the "Greek Defence Committee," which were revealed by our Oxford correspondent "in all the ghastliness of their *puris naturalibus*," as the Baboo phrased it. But we may dwell for a moment on the line of defence taken by Sir William Anson, who held the brief for the defendants.

Every one who took the B.A. degree, or whatever the degree might be which carried with it the *imprimatur* of the University, should either possess when he came to the University, or should acquire during his stay there, what he would call a "liberal education"—that was an education in which science and scientific method and language and literary training had their own part and balance.

Brave words which well befit the Secretary of Education, but they wholly misrepresent the development of Oxford as a modern University and resist a small measure of reform on the specious ground that a sweeping reform is needed. If Sir W. Anson really wishes to make the balance true, why does he not propose that some *modicum* of science should be required for entrance to the University and some mathematics beyond the two books of Euclid which the classical man has only to learn by heart? One other sophism needs exposing. Sir W. Anson deprecated "the substitution of French and German, which they had only begun to learn how to teach, for Greek, which teachers for generations had made into a great "educational machine." Antiquity is not an unmixed blessing, and, if we no longer teach Greek through the medium of Latin, as was done in Sir William's school-days, if we have ceased to make the pupil learn pages of grammar by heart before he has read a word of the language, these reforms are due in no small measure to the example and practice of the despised modern language teacher.

PROF. JEBB'S speech in the Senate House was worthy of the author of "The Attic Orators" and the representative of the University in Parliament—an admirable mixture of grave and gay, but his arguments will not bear dissection. 1. "The demand is for a 'soft option,' inferior French and inferior German." "Inferior" is a question-begging epithet. Is not unseen French or German superior to seen Greek? 2. "If the present amount of Greek taught to passmen is too small to have any effect, the remedy is an improved method of teaching in schools." Is not this putting the cart before the horse? The obvious remedy is to raise the standard of the University examinations; but not even Sir Richard is bold enough to propose so heroic a remedy. 3. "It is said that science men who have done Greek for Little-Go never look at it again; but the point is that they have the opportunity of so doing, and it is unreasonable to deprive them of that opportunity because many do not use it right." This argument would apply

with more force to an advocacy of compulsory German. But most science men learn their German after they have left school, or even college. Why should they not learn Greek likewise? Instances are not lacking of *opsimatheis* in Greek—Cato, Hobbes, Lord Cromer. 4. The awful example of "a Greekless land" whose astronomers talk of "Boots" is Sir Richard's drunken Helot, but can hardly have been intended for a serious argument. Latin—or, for that matter, English—poetry will teach the right pronunciation of Boötes. "Hamlet" and "Troilus and Cressida" are still read, though Shakespeare mispronounces Hyperion and makes Hector quote Aristotle. Greek may be made a shibboleth. John Bright was a man of culture and an orator, though he did once talk of the Pythchley hounds.

THE Studies Syndicate must feel proud. Mr. Oscar Browning has congratulated them on their Report. "It is one of the most able and statesmanlike documents which I have ever seen issued in this University," and he proceeds to summarize its many virtues. But there is the rift within the lute, the fatal flaw which has determined Mr. Browning on second thoughts to give an adverse vote. It does not prescribe a *viva voce* examination in French and German. In 1871, when the abolition of compulsory Greek was nearly carried, Mr. Browning was fired with hope, and shouted to the morning star. "We believed in the possibility of a Modern Humanism, of a culture founded on living languages, not inferior to that which is based upon the dead." But the vision of youth has faded. "The study of modern languages has made very little progress, and the freshmen of to-day know as little of the living tongues as they did in the seventies. I prefer, therefore, to wait till the study of modern languages has grown to maturity." We, who may claim to be more intimately acquainted with schools than Mr. Browning, are convinced that the teaching of French has in the last thirty years made vast strides, and this is proved by the reports not only of the Modern Language Association, which we commend to Mr. Browning's notice, but also of the Joint Board and Local examiners. Be this as it may, there are surely the same possibilities for modern languages in 1905 that there were in 1871, and Mr. Browning was ill-advised in assigning a reason for changing sides. There was no need to invent a new euphemism, "grown to maturity"; we all understand "the Greek kalends."

THERE are excellent points in the London scholarship scheme viewed from an educational standpoint. The age of the candidates is to be between eleven and twelve years. They are to be selected in the first instance by the head teacher, and those who acquit themselves well in a written examination limited to arithmetic and English composition will have their claims dealt with by a board of examiners who will take into consideration reports from head teachers and from local committees organized *ad hoc*. There is to be no fixed number of scholarships awarded; between 2,000 and 3,000 is the proposal. No candidate is to be refused who comes up to scholarship standard. In practice, of course, the standard must vary according to what is practicable. The Education Committee would probably find it difficult to place an extra thousand children to-morrow in the secondary schools of London. But, good as we find the proposals for securing a suitable selection of scholars, we cannot help regretting that the whole scheme is an obvious attempt to increase the supply of teachers in public elementary schools, and is not based, as it should be,

Greek
at Oxford.

Mr. O. Browning's
Maturitäts-
examen.

Sir R. Jebb
on Greek.

Three Thousand
Minor Scholars,

on the principle of educating the best talent in the elementary schools for the service of the country in commercial and industrial pursuits.

THE scheme has been widely noticed in the press, and not unnaturally, as it portends an extra penny in the pound on the rates. The result of this criticism may be

Of whom
two-thirds are
Girls.

a modification of some of the proposals, for the discussion in full Council is postponed till after the Christmas holidays.

We do not know how far the London secondary schools are prepared to meet a large influx of scholars. Doubtless the Education Committee has foreseen this difficulty, and has either made arrangements or is prepared with proposals. The Finance Committee seems to withhold its approval for the present, and there will certainly be some criticisms made before the scheme is adopted. With the general tenour of the proposals we are in accord; especially with the excellent plans for discouraging cramming; but it seems to us impossible that there should be twice as many girls as boys in the public elementary schools who would profit by a secondary education. By all means let intending pupil-teachers enjoy a secondary education with children preparing for other walks in life; but to make a great scholarship scheme subservient to the supply of teachers is to invite ridicule rather than support.

IT is understood that the Board of Education consented to receive, and did receive, a deputation from the Joint Conference of Head and Assistant Masters, presided

Deputations and
Mystery.

over by Sir Edward Fry, to urge that certain modifications should be made in the schemes of endowed schools, limiting

the absolute right of the head master to dismiss at pleasure the assistant master. It is further known that Canon Bell and Dr. Fry, supported by Mr. Page and Mr. Daniell, presented the case, and that Sir William Anson made a reply. There, for the present, the matter ends. All we know is that the Board possesses among its archives certain important information. The two accredited bodies of head and assistant masters have come to definite conclusions, and these are in the hands of the Board. A few weeks later Lord Londonderry received a deputation from the Association of Chambers of Commerce. A full report of the replies made both by Lord Londonderry and Sir William Anson appeared in the press. Why, then, in the former case should such extraordinary secrecy be maintained? It is clear from other sources that the Board does not lend a willing ear to any proposal for the curtailment of the autocracy of the head master; but the case of the Board must be indeed weak if it deprecates public discussion. We are quite convinced that, if the Board will not hear reason in this matter, in a short time it will find itself forced by Local Authorities into granting more power to the governing bodies with regard to the appointment and dismissal of assistant masters than either the Board or school-masters desire.

THE value of private enterprise as opposed to State organization has been shown in a very marked manner by the work of Mr. Sadler. Since Mr. Sadler left

An Educational
Motator.

the Board of Education because he could no longer see eye to eye with his chiefs, he has become a power—we might even

say the power—in English education. It is a curious position, and one well worth study and investigation. It has been given to few men of ideas to see so immediate a

result as has followed, and is following, Mr. Sadler's utterances. His reports to Local Authorities are becoming the gospels of the Education Committees. We read in the papers as to this or that matter: "The scheme was originally suggested by Mr. Sadler and was taken up by Mr. Chamberlain," or "The idea which was conceived by Mr. Sadler," and so forth. Mr. Sadler is not only a man of ideas, but he can express those ideas in relation to actual present-day problems in a manner to catch the imagination of men of influence. He combines the views of the educational theorist and of the utilitarian. In his own words: "All true education has a double purpose—(1) the development of the moral personality, of the physical powers, and of the intellectual aptitude of the individual; (2) the fitting of the pupil skilfully to perform the duties of some definite calling, or type of calling, in life." And his reports show how these ideas can be carried out in practice.

THE Association of Head Mistresses has issued a leaflet on assistant mistresses' salaries (drawn up, we are informed, by Mrs. Bryant), stating what, in their opinion,

Assistant
Mistresses'
Salaries.

is a living wage. Starting from the premiss that a teacher should be self-supporting, that is, able to afford 30s. a week for board and lodging, and £20

extra for holidays, and to make provision for old age, they consider that a fully qualified teacher (one with a University degree and trained) should receive for her probationary year a salary of not less than £105 to £120. For her second year, her salary should be at least £120, and should rise to £150. Heads of departments, or mistresses with special qualifications, should be paid at a higher rate, rising to £300, or over. This is fairly commensurate with the scale of salaries for assistant masters proposed by Prof. Sadler in his Liverpool Report, and it represents a rise of some 50 per cent. on present rates. But, as is pointed out, elementary teachers who are trained almost entirely at the cost of the nation, and who begin their work earlier, receive a higher salary, rising by steady and fairly rapid increments, than many secondary teachers. It is argued by the G.P.D.S.C. that the supply is still in excess of the demand. The head mistresses are not of this opinion; but, if it were the case, they would still not be satisfied. "Even if it is possible to find enthusiastic teachers who are willing to work for inadequate pay—until they break down—this is a very extravagant plan."

THE Defaulting Authorities Act was intended to bring Wales to heel, and, no doubt, its promoters hoped that the mere threat would suffice. For one reason or

The
Coercion Act.

another the Act has not yet been put in force in Wales. There are those who say that Mr. Morant hesitates to try a fall with

Mr. Lloyd-George. We would prefer to believe that so long as a hope of compromise remains—and this hope is increasing rather than diminishing—Mr. Morant deliberately holds his hand. But even the most serious critic of the educational policy of the Board is inclined to smile when he learns that this terrible and much to be dreaded Act has actually been put into force in the harmless and peaceable area of the Isle of Wight. For some time past there has been a struggle between the Board and the Local Authorities of the island on various matters. The climax has been reached in the case of the Norton Green School, Freshwater. The Board has stepped in and appointed managers, who, in their turn, have appointed a mistress, and all goes merrily on.

WE are willing to admit that holidays in secondary day schools are unnecessarily long from the point of view of the staff. Their length is an inherited tradition of

The Length of Holidays.

boarding-school life. But we are not able to follow Mr. Jonathan Taylor, of the Sheffield Education Committee, in his arguments on this subject. Mr. Taylor has been "credibly informed" that the holidays at the Sheffield Central Secondary School amount to ten weeks during the year. He asks the Committee to note that the interest on the capital expended on the school buildings is £3,000 a year, and that the staff costs £5,000 a year. Consequently in the ten weeks' holiday they sacrificed £600 in the shape of interest and paid £1,000 in the shape of salaries. He added that 90 per cent. of the people whose money paid these salaries did not have a single day's holiday in the year without having their day's pay deducted. We wonder if Mr. Taylor will some day hear of schools having fifteen weeks or more of annual holiday, and that the comparative shortness of the holidays at this school in Sheffield may make it difficult for the head master to fill up vacancies on his staff. But we are quite sure of one thing—if the Local Authorities seriously shorten holidays, and if the schools continue to work at the present high pressure, the health of the children will soon be affected. The right solution, in our opinion, is longer terms but more playtime during daylight, and less work to be done at home.

WE have received a copy of the petition to the Central Education Authorities of the three kingdoms signed by nearly fifteen thousand registered medical practitioners,

The Teaching of Hygiene.

urging the enforcement of hygiene as a compulsory school subject. Not only the numbers, but the names of the Committee—which include Sir T. Barlow, Sir W. Broadbent, Sir T. L. Brunton, Sir V. Horsley, and Mrs. Anderson—give weight to the petition, and the precedent set by the United States and most of our colonies cannot lightly be disregarded. We have already backed the demand as sound in principle, but we must still demur to the proposed application. That all teachers should know the elements of hygiene and that all pupils should, in some form or other, be made acquainted with the fundamental laws of health and, in primary schools, be warned against the consequences of intemperance, is one of those obvious truths that all accept but few act upon. We doubt, however, whether the introduction of hygiene as a tenth compulsory subject under the Code and the assignment to it of an hour a week in the time-tables would be an unmixed gain. It is no more possible to teach physiology in an elementary school than chemistry. The most the teacher can hope to do is to bring home to the mind and conscience of the pupil the essential facts established by physiology. The demon of drink is not to be expelled by prayer and fasting—that is, by formal lessons alone—but by creating wholesome interests which will leave no room for the unnatural craving. For this reason we misdoubt the weekly lecture on hygiene if it is to displace a lesson on history or geography.

MR. J. A. REED, in the *Speaker*, raises an important question to which educationists are bound to give a plain answer: Shall the principles of evolution be taught in schools? As a matter of fact, we may

Should Evolution be taught in Schools?

say roughly that in natural science lessons the evolutionary theory is freely accepted and taught, but in Bible lessons it is either rejected or ignored. The leading authority is Canon Bell's "Religious Teaching in Secondary Schools." Two quotations will sufficiently indicate the head master's attitude:

"Science has filled in with magnificent wealth of accurate detail the rudimentary traditional outlines of the Bible record. . . . On the other hand, Darwin's theory of man's origin and development is still imperfectly proved." So, too, as we learn from the recently published "Life," Bishop Creighton declined himself to read Darwin's "Origin of Species," and advised others not to read it, as embodying an unverified and unverifiable hypothesis. But this separation of sacred and profane in watertight compartments which satisfied Bacon is no longer possible, and the outspoken lectures of the Dean of Westminster on Inspiration will go far to break down the barrier. As Mr. Reed remarks, people will accept from a dignitary of the Church what they will not take from anybody else. A late head master, also a Dean, used to tell his unorthodox assistants that in Bible lessons they need teach nothing they did not believe, but must teach nothing contrary to the Thirty-nine Articles. If Scripture lessons were taken seriously in public schools, such economy of truth would seem as absurd as engaging a Copernican to expound Ptolemaic astronomy.

THERE was an admirable letter from Canon Hensley Henson in the *Westminster Gazette* (December 19), setting forth his objections to Mr. Lathbury's plea of handing

Canon Henson on Undenominationalism.

over the religious teaching in State schools to the clergy and their lay volunteers. First, we know, by experience of Sunday schools, that these volunteers are not efficient either as teachers or as disciplinarians. Secondly, the most capable of them could not give their services on week days. Thirdly, at present, practically all children attending State schools are receiving some kind of Christian teaching, with the good will of the nation generally and to their own great advantage. Are even Churchmen prepared to sacrifice a substantial half for a shadowy whole? Lastly, the Canon pours fine scorn on the Anglicans who will not away with "that simple Christianity common to all Protestant Churches, which was well taught in the better Board schools and is generally taught in most denominational schools," who construct a *chimæra* called "undenominationalism" and overwhelm it with sarcasm and denunciation. "In the main, the elementary-school teachers reflect in their religious convictions with sufficient fidelity the actual facts of the national Christianity. Apart from this, the religious teaching cannot be given at all."

A PROPOS of the new Fielden Demonstration School at Manchester, a correspondent directs our attention to the fact that this is the second of two schools established in

The Fielden School not first in the field.

intimate, though unofficial, connexion with the Department of Education in the University of Manchester. The first school was started more than two years ago, in the spring of 1902, at 223 Brunswick Street (just by the University), through the exertions of a number of private persons, and was placed under the direction of Miss Dodd. It is an elementary school (for children from the lowest age up to fourteen), with a careful scheme of continuation of studies. From the beginning it was designed and has been used as a practice and demonstration school for the students of the Women's Day Training College, in organic relation with their theoretical work. Students teach in it throughout the session, in supplement to the regular staff mistresses. It has now some hundred children, and had to be enlarged after the first year by taking in a second house, opened last session by Prof. Rein, whose school at Jena this school resembles. The interest taken in the methods and arrangements of the school by teachers and others (not in Man-

chester only), and its utility for the students, make the more welcome the new school, to be directed by Prof. Findlay, which is of a different character—for children between different limits of age—and designed to serve the needs of other students (for only women students of the Day Training College have been regularly provided for by the existing school). Whether they are regarded as experiments in special types of school, or as laboratories for the training of teachers, the University is to be congratulated on the liberality and enterprise which have provided its educational training work with two such schools.

NO harm can result from making use of the new Imperial spirit to encourage the study of geography. It is natural for Englishmen to wish to know something of the countries for the rule of which England is responsible. It is even useful, as Mr. Brodrick pointed out the other day, for the War Office to know that, with the present means of communication, "an Army chaplain in South Africa cannot take morning service in Cape Town and afternoon in Durban." The older Universities and the public schools are so obedient to tradition that great pressure from the outside is needed to produce a change. For this purpose we may welcome the use of the Imperial lever. But, on the other hand, the study of geography, taken in its full meaning, quite apart from utilitarian considerations, is as fascinating as the study of any other phenomena that influence human life. The subject, treated from historical, commercial, political, or physical standpoints, can hold its own in training value with any other school subject when it is taught by a properly trained geographer who believes in what he teaches. There is room for improvement; above all, there is room for more skilled teachers; but our critics must not overlook the enormous advance that has been made in the last twenty years—an advance in which Mr. Mackinder and Oxford have played a considerable part.

AFTER much discussion of a somewhat acrimonious character the London County Council has resolved to abolish all fees in the 179 non-provided schools in which fees are still charged. The new order will come into effect after March 31 of this year. The decision presents to parents in London the sum of £26,525, and adds a corresponding amount to the rates. But we cannot doubt that the decision is a wise one. The intention of the Act of 1891 was to bring free education to the child of every parent who desired it. To retain fees in certain schools is but an attempt to give them a *cachet* of social superiority—quite unfair, when it is considered how small an item the fee is in comparison with the cost of education, a cost borne by public funds. It is not the duty of the Local Authority to pander to this idea of social distinction. But a curious result will undoubtedly ensue. We shall at once see a number of small private schools spring up to meet the wishes of parents who dislike free education. These schools, not being public elementary schools, will be classed by statisticians as secondary. They are bound to be inefficient because they will have to live entirely on the very trifling fees that will be paid. This state of affairs will probably be temporary. But the immediate result of the decision will be to call into existence a number of inefficient schools.

IN these days when the organization of education is growing apace it is useful to have a man like Prof. Findlay who will boldly preach against the materialistic

The Democracy and Education.

view of education, taking as his text the Gospel saying: "He that saveth his life shall lose it." We do not think that Mr. Findlay would succeed, or even desire to succeed, in arresting the growth of educational organization; but he may, and indeed will, help in introducing some of the spirit that quickeneth into the corporate bodies that govern us. The democracy has, as Mr. Findlay pointed out in a recent lecture in Manchester, asserted its right to control the teacher and his work. It is therefore vitally necessary that the people, who in a great measure make the teacher, should form right ideals of education. There is a danger lest teachers' lives should be occupied in filling up forms, answering questions, and in the external machinery of their business. The real work of the teacher is in his personal contact with the pupil. But the democracy in its present attitude towards education asks not only that the teacher shall turn out "good men and good women," but that the good qualities should be in harmony with the life of the community. We want to put "character" first; but we want the character to be adjusted to wage-earning.

THE Association of Training Colleges passed, by a large majority, the following resolution:—"That this Conference notes with regret the apparent discouragement of University studies in training colleges in the regulations recently issued by the Board of Education." It is obvious that teachers ought to be well educated, and it is generally recognized that a University degree puts a convenient label on the course of education. If we venture to differ from the views expressed in the resolution, it is not because we undervalue the possession of a University degree. Recently we found fault with Sir William Anson for speaking slightly of the desire of the teacher to become a graduate, and we said that so long as a University remained the only body with power to set a seal upon a course of education, so long would the ambition to gain a degree be laudable upon the part of students in training colleges. But the views expressed by Canon Taylor at the Conference deserve careful consideration. The possession of a degree, he pointed out, did not necessarily fit the teacher for school work. The academic side of education was being abnormally pressed. And the teachers who took degrees did not remain long in the teaching profession. This is the important point, and we shall be curious to see how the Consultative Committee propose to stop the leakage. The training colleges are preparing men for various careers. Hence, partially, the growing dearth of teachers. The remedy is that, while teachers should rank as university graduates, they should be required to pass really adequate and suitable qualifying examinations before they obtain permission to teach.

THERE is a story of an official, newly come to London, who used to reach his office and "sign on" at an early hour in the morning. Then, to satisfy his youthful curiosity, he would take a long walk about the metropolis and come back, finish his work, and finally "sign off" at a late hour of the evening. In his innocence he imagined it did not matter when he did his work so long as it was done. It was many years later that he learnt that his rapid promotion was due to the opinion, based upon the attendance book, that his chiefs had formed of his industry. Sir William Collins is warned in time, and will not be guided as to promotions and increases of salary by the figures in the attendance book, or by the willingness of the staff to work over-

B.A. versus Teachers' Diploma.

Long Hours.

time. Sir William is annoyed at the public notice that has been called to the scandalously long hours worked in the London education offices. For our part, we are glad that some one has had the courage to lay bare the facts. Not in London only, but in many an education office up and down the country, the hours of work have been, and continue to be, far too long. Sir William promises amendment, and the solatium of extra holidays at Christmas. Indeed, the Council is already advertising for a large number of additional clerks and unclassified assistants. In the executive department there are to be an "assistant executive officer," with a salary of £600 to £800, and a "principal assistant" with a salary of £400 to £600. We do not understand the nomenclature; we give it as stated.

WE have no reason to doubt the accuracy of a story in the *Dublin Evening Telegraph* which tells how public bodies are liable to err and to err in a ludicrous manner. The story is, indeed, humorous, and, if no serious interests were at stake, would merely provoke laughter. Under the circumstances not a little indignation may be mingled with the laughter. It appears that ten years ago the lease of the Glengariffe National School expired and it became necessary to take out a fresh lease and re-vest the school in the Commissioners of National Education in Ireland. The Commissioners refused to re-vest on the ground that the playground was too small. As it was not possible to acquire more space, the matter rested for eight years, when another request was made to the Commissioners. Three inspectors were sent down, and in due course came another refusal—this time because the playground was too large. But, if the school would pay one third of the cost of building a wall to cut off part of the playground, the Commissioners would take over the school. The wall was built in August last. Shortly after comes an inspector of the National Board, who reports that the playground is too small. A few weeks ago a letter was received from the Board of Works saying that, unless the managers would pay one third of the cost of removing the partition wall, the teachers' salaries would be withdrawn. For the proverbial Irishman's blanket we may substitute in future the Glengariffe playground.

LOCAL AUTHORITIES.

THE defunct School Board of Birmingham advised its successor to lose no time in providing increased accommodation for mentally deficient children, and the subject has been under discussion on more than one occasion since. The main difficulty has been the selection of a site. Some thirty possible sites have been considered, and a sub-committee visited and inspected nine of them. The site recommended consists of twenty-two acres, which can be purchased at a cost of £1,700. It is proposed to build a boarding school on the cottage-home principle. It is possible that the Council may object to the scheme on the ground of initial cost. The accommodation proposed is for eighty children, which works out at over £20 a head for land alone. Mrs. Pinsent, however, had strong arguments in favour of the proposal. She pointed out that there were certain children whom it was impossible to educate in a day special school. Their presence made the work more difficult. They came from the most wretched and degraded homes, and were often so dirty that it was impossible to instil common decency into them. Yet they could not be classed as imbeciles, and so the Education Committee must undertake their charge. Experience had shown that such children were often capable of doing simple manual work. The best plan was, therefore, to remove them entirely from their home influences, to educate them in a boarding school till the age of sixteen, and then to pass them on to an industrial colony. To cope with the existing evil there can be no doubt that boarding schools are necessary. In the meantime, while the school is building, arrangements have been made for the temporary

accommodation of additional children, eighty-two of whom are claiming admission to the existing day schools.

A REPORT of the number of pupils in day schools other than public elementary schools has just been issued by the Education Authority of Plymouth. We learn that in the Council secondary schools 184 pupils (87 boys and 97 girls) are educated, while the proprietary

and private schools account for 1,731 (843 boys and 888 girls). This works out at about one pupil in 56 persons who receives an education other than that of a public elementary school. The Board of Education recommends that accommodation should be provided for one in 42. Plymouth, with its population of 113,000, should therefore have 2,600 secondary-school places. The report proposes that an inspection should be made of those private and proprietary schools that are willing to work with the Council. Schools may, with the approval of the Council, choose which recognized inspectional body they prefer. The schools that are named as efficient are to have certain aids and privileges; but these do not seem to include a money grant. They are, briefly, use of laboratories, assistance of visiting teachers, and loans of apparatus. The schools will be publicly announced as "efficient," and they may receive scholarship-holders. Such proposals ought to be very cordially accepted by the majority of the private schools. The inspection would extend to the premises, the number and qualifications of the teaching staff, and the suitability of the curriculum. It does not appear that any inquiry will be made into the finance of the school; but it will certainly be the duty of the Authority to satisfy itself that adequate salaries are paid. If the proposals are carried out, Plymouth will get a system of approved secondary education with the minimum of cost to the ratepayer.

THE report gives a list of sixty-one proprietary and private schools, which together educate 1,731 pupils. The further inspection which is contemplated will probably prove that a number have no wish and no right to claim the title secondary. One school has 3 pupils only; sixteen have 11 pupils or less; ten schools have from 11 to 20 pupils, and nine from 21 to 30. Only fourteen out of the sixty-one have 50 and upwards. The ages of the pupils vary from three years to "over fourteen." So large a number of small schools implies a good deal of waste and comparative inefficiency, and, if the Plymouth Authority is to exercise a wise influence, it must limit its support to a small number of schools with buildings suitable for secondary day schools. The average gives 35 pupils to each of these sixty-one schools. But the list includes Plymouth College, with 138 day boys. This is a school with a body of governors and is invited to send a representative to the Head Masters' Conference; so that when we read in the report that 1,731 pupils "do not avail themselves of the school system under public control" we have to conclude that "public" means "municipal." Such an unscientific list of proprietary and private schools lessens the value of this inquiry. It is to be hoped that the Education Authority of Plymouth is able to recognize that there is other public control that guarantees efficiency besides that of its own office. An interesting point in the figures given above is the number of boys and girls respectively. They are almost equal in both classes of schools. Birkenhead, with a population about equal to that of Plymouth, has, according to Mr. Sadler's report, twenty-two private schools.

THE Wilts Education Committee has broken new ground in issuing to the teachers under its control a memorandum on the teaching of arithmetic. Mr. Pullinger, who signs the memorandum, is a Balliol Scholar who took a First Class in Natural Science. He may therefore be allowed to speak with authority; though, outside his administrative work, his record has been with chemistry rather than mathematics. The publication of this document is an interesting new departure; and whether or no the Director of Education in a given county is an expert in the teaching of this or that subject, he has, at any rate, expert advice at his command. The memorandum in itself seems to us excellent. Its main lesson may be summed up in a phrase: Arithmetic should be made real. It should not deal with matters outside the pupil's experience, and, as far as possible, actual measurements and concrete calculations should be made. It is well known to teachers that the working out of sums according to an example worked on the black-board leads to mechanical imitation and is destructive of understanding. But we see difficulties ahead. Teachers, many of them, come from training colleges where the best methods are, or should be, taught. They are guided by the Code and watched by inspectors. What is to happen should the directions issued from the county office run counter to those of Whitehall? But no doubt Mr. Pullinger has consulted inspectors and other authorities. The memorandum is rather a reminder to teachers who have grown slack or who have not kept up with the changes of the day than an attempt to instruct the well trained man, who has, or should have, heard it all before.

FEES IN SECONDARY SCHOOLS. SEEING the enormous increase in the number of scholarships given to enable children in public elementary schools to proceed to secondary schools, we are not in favour of lowering the fees in secondary schools. At present they are far below the cost of education. Any

further move in the direction of cheapening the cost to parents of secondary education should be resisted. The cry for free secondary education for all who are capable of profiting by it is adequately met by the scholarship system. As things are, these scholarships are in some cases worth only £3 or £4 a year. To lower their value still further is to make the scheme of scholarships a mockery. The governors of the New Mills Secondary School (Cheshire) have fixed the fee at 30s. a year, on the ground that the parents are of the artisan class and cannot afford more. The Board of Education has consented for this year only, and insists that the fees in future should be raised to £3. The Board makes also some sharp criticisms on the composition of the governing body, which includes neither women members nor any University representative. Another point in dispute is the position of the head master relative to the governing body. The Board urges that the scheme should secure formally to the head master the right of being consulted in the fixing of the curriculum, the right of controlling the internal management of the school, and the right of appointing and dismissing assistant teachers subject to his general responsibility to the governors and to his immediate report of his actions. If the head master is to have no initiative and no power of management, the result will be a rapid deterioration in the *genus* head master. Secondary education costs from £12 to £40 a year per pupil. To fix the fee at 30s. is out of all proportion to the cost.

Scholarships in Staffordshire. DURING the years 1891-1902 the Staffordshire County Council has elected 62 major scholars—51 boys and 11 girls. These figures exclude those scholarship holders who failed to keep their scholarships for more than a year, and also those whose scholarships are yet running. The annual value of the scholarships varies from £50 to £20. But only one of £50 has been awarded during the whole period under review. Nine holders received £40 a year each, twelve received £30, and the remainder, forty, had but £20. This modest sum is too small to enable a working man to accept such help for his son. It seems probable that the recipients are either well-to-do or that they receive help from other quarters. Out of the whole number of 62 major scholars, 12 had held minor scholarships, and only 4 intermediate scholarships. To a certain extent it would seem that Staffordshire has not succeeded in forming a ladder from the elementary school to the University. And of the 12 minor scholars, 5 received scholarships limited to candidates from secondary schools. This gives 7 out of 62 who probably started their educational career in a public elementary school. No particulars are given of 12 out of the whole number; the remaining 50 proceeded to one or the other of ten Universities or colleges—Aberystwyth, 6; Birmingham, 14; Cambridge, 15; Durham, Liverpool, London, Bangor, and Sheffield, 1 each; Manchester and Oxford, 5 each. It is remarkable that only 38 took a degree or its equivalent. History is silent as to the rest. On the other hand, 14 obtained First Class Honours, and the list of present occupations of scholarship holders includes eight doctors, a barrister, two solicitors, three University teachers, and eighteen teachers in secondary schools.

HOW JOHANNES STURM WORKED IN LIFE AND AFTER IT.

IN the late Mr. Quick's gallery of "Educational Reformers" the figure of Sturm—no favourite, as he confessed, of his—appears in shadowy and uncertain outline. The Strassburg humanist, prominent in his own age and of far-reaching influence beyond it, deserved a more vivid portraiture. Nor is he treated quite justly in the English text-book. Denounced as the father of verbalism, he was not in reality an innovator, but owed his power to constructive ability. Like many others who have been deemed reformers, he was not so much a rock affecting the direction of a current as a straw on the surface of controlling waters. His true importance lies in the fact that the school as he shaped it became a model. He has especial interest for us at this time because the merits of the model are being vigorously challenged.

When, in 1537, the young German scholar, after studying at Louvain and lecturing at Paris, came to Strassburg, two great forces, at first often antagonistic, were fashioning the thought and history of Western Europe. A general kindling of inquiry had begun. Humanism was the expression of the new move-

ment in the intellectual world, Lutheranism in the spiritual. In its earlier stages the Reformation injured or swept away some of the old machinery of education. Convents for men or women could not thrive amid the spread of a doctrine that threatened to empty them; and, since none would study for a bootless consecration, the Universities saw their coffers run low as their numbers dwindled. Sometimes the monastic or the cathedral school came to lack teachers, scholars, and even a roof. Moreover, the Catholic apologists, for their part, pronounced "tongues" to be the very source and root of heresy. But soon the religious opposition ceased to harm learning, and both parties found it wise to enlist the humanistic studies in their service. Of the lights of humanism when Sturm changed the field of his activity, Erasmus had just died; but Camerarius was in his prime, and Melancthon but ten years older than Sturm himself. From many centres constellations of smaller luminaries added brightness to an age which proved to be a new dawn for mankind. The effects of the first conflict were passing away, and it was a work of restoration that fell to the hands of the lecturer from Paris. The four mediæval foundation schools and all the monastic schools of Strassburg had perished with the secularization or transfer of Church property in the city. Sturm's mission was to organize afresh the scholastic system. He became the creator of the Strassburg *Gymnasium*.

In the world of scholarship, or, rather, in that part of it which lay about the Rhine, two schools were distinguishable—the Upper Rhenish, which had been represented in Strassburg by Jacob Wimfeling, himself the author of proposals for a *Gymnasium* there, and that of the Netherlands, or Lower Rhine. It was to the latter that Sturm, educated in part at Liège, belonged; it was the latter also that claimed superiority and possessed higher repute. Both schools had by degrees put away the brain-numbing treatise of Alexander de Villa-dei, whose "Doctrinale" taught in three thousand bad hexameters how to construct bad Latin prose. Both searched for rational modes of instruction in grammar. But the chief note of the Netherlands—not impressed, however, on them all—was a revolt from the Latinity of the schoolmen to that of the classical period. The exercises that they favoured in prose and verse had purity of style in view. They sent out many scholars well versed both in Latin and in Greek; among these Erasmus, prince of humanists in wit and erudition, but not representative of the school. He took a wider view than his teachers of the scope and pliancy of Latin.

Trained in this school, Sturm brought with him its tendencies. He probably believed and hoped with Jacob Agricola, its great inspirer, that Germany would attain to such learning and culture "that not Latium itself should be more Latin." It is true, as Mr. Quick asserts, that he wished to restore to honour the language of Cicero and Ovid. But the statement only gets its proper significance by contrast. Wimfeling, in his school-planning and schemes of education, had recommended as authors to be read Cicero, Sallust, Valerius Maximus, and Seneca; but he joined to them, of the Christian prose writers, Ambrosius, Lactantius, Fr. Petrarcha, L. Aretinus, and others like them; of Christian poets, Prudentius and Sedulius; and he thought Baptista of Mantua no less worth study than Virgil. If Latin books would yield useful knowledge, he was not sensitive as to their Latin style. Sturm, on the other hand, looked for correctness and perspicuity of language: the best words were not those which weighed most, but those which issued from the best mind.

To erect a temple to classicism—that was the object of Sturm the scholar. By what principles was Sturm the pedagogue governed?

At Liège his teachers had been the Brethren of the Common Life; and from them he derived some of his theory and more of his practice. He aimed to beget in his pupils both piety and wisdom. More explicitly he declares "*Sapientem atque eloquentem pietatem finem esse studiorum*"—that a wise and eloquent piety is the end of all studies. The piety wore the colours of the Reform party, to which Sturm had given his adhesion. The wisdom was a knowledge of things. So far, Sturm's pedagogy had nothing characteristic about it. All the German humanists of the day could have subscribed his creed with a good heart. But in practice his system gained particularity by the extent to which under it the piety and wisdom were required to be eloquent. Wisdom, the *cognitio rerum*, was

for ripeness; immaturity would fatten on words. Language dominated the school, and the methods employed to teach it may best be described as rhetorical. Again, rhetorical methods led to the goal of rhetoric, chiefly after Latin, but also after Greek, exemplars. To speak Latin as the Roman orators spoke it—this was to be the ambition of the boy, and the ideally finished product of the Sturmian school would have been a Protestant Cicero of sixteen.

This may seem now a strange and futile object to pursue. But, if any should ask why the supremacy was given to Latin, the answer is not hard to furnish. It is not likely to have occurred to the school-maker that German, the native tongue of his pupils—for Strassburg was then, as now, German—would yield abundant wealth to those who mined in it. French—the French of Molière—was rather in the making than made, nor had it obtained its subsequent vogue. It was in Latin that nations transacted their affairs and scholars exchanged opinions; and, as to religion, to be ignorant of Latin was to stand as an unarmed child amid the warfare of the age. The language had the utmost *practical* value. Why, again, should it be taught rhetorically? Because he who spoke it effectively, and so by inference could write it with ease, held the master-key in diplomacy and polemics. Greek, too, was a *practical* study; for the Greek were contained the later oracles of God and the weapons of controversy. Underlying, as the attentive will observe, the whole conception of a school was the pernicious idea, not yet quite extinct, that the business of education is to produce a learned caste. The thought was not of enriching the life of a people, but of breeding scholars to be the people's exclusive voice. Germany knew not then that the Greek minstrel singing at some harvest of grapes was at least as much an educator as the schoolmaster with a score of lads dancing to his birch.

It would be out of place here to examine with great minuteness all the features of Sturm's pedagogy. Those who are curious about the subject will turn to Veil and to Ziegler. Only let it be clear what the rhetorical method was. The classics were not literature supplying food for life, but dead words. Learn them by rote, impress their phrases on your memory, and reproduce, upon occasion, their elegancies as your own; so, in effect, ran the precept. The following of it has received the name of "the jackdaw trick"; for the jackdaw not only stole the peacock's feathers, but pretended to have grown them. Besides the ancient languages few matters of instruction were offered to the boys. It is only when Sturm comes to lay down the work for *Prima*, the highest class, that he writes; "Arithmetic must be given, Mela (for geography) examined, Proclus (for astronomy) put in hand, and the elements of astrology learned." It may be suspected that the pedagogue would have found it difficult to be particular in some cases where he generalizes, and that a detailed curriculum of scientific study would have been beyond his powers. As to the piety, the flower that was to spring from all the disciplines, he does not seem to have had any deep feeling for religious education; but he strove to promote honest ways and good morals. "Magna nobiscum barbaries nascitur," he remarks; pain may be used to remedy the natural perverseness, but cruel teachers must be removed from office.

Such was the scholar, such the pedagogue, under whom the Strassburg *Gymnasium* opened at Michaelmas, 1538. The word *Gymnasium* in the middle of the sixteenth century meant more than now, and Sturm's *Gymnasium* aimed much higher than the "Latin schools," of which (to take the place of the monastic and cathedral schools) the Civic Council had established several. It brought them together under the roof of the Monastery of the Barefoots, and made of them the nucleus and rudimentary part of itself. A "Latin school" had consisted, as a rule, of three classes—the first under the schoolmaster proper; the second under the assistant (*provisor*, *synergus*); whilst the third was taught by the *tertius*—often a well trained pupil of the first class. The new institution, designed to be of eight, had soon ten, classes. Moreover, in the same building—after a year the old house of the Barefoots was abandoned for that of the Dominicans, or Preachers—*lectiones publicae* (public lectures) on the ancient languages and rhetoric, philosophy, mathematics, law, and theology conveyed more advanced instruction. The lectures delivered by professors (*professores*) were regarded as the inseparable complement of the classes of the schoolmasters (*praeceptores*). The institution

gained unity from the fact that it had one rector (Sturm himself), and its teaching was viewed as continuous. For its full course fourteen, presently increased to fifteen, years was the normal time requisite—five of them being given to the complementary lectures. Obtaining, in 1567, an Imperial charter by which it was privileged to bestow the lower degrees of Bachelor and Master, but not the Doctor's hat, Sturm's creation occupied an anomalous position; it was half school and half University. Curious to relate, the same vagueness and uncertainty vitiated educational nomenclature in the sixteenth as vitiate it in the twentieth century. What is sanctioned by the Charter is now *Universitas*, now *Studium generale seu Gymnasium*, and again *Academia*; just as, to cite a modern English ambiguity, an "academy" may be either the proudest or the meanest place of education. Six was accounted the most suitable age for a boy to enter the institution. Admitted, he would devote *nine*—or, as was afterwards the custom, *ten*—years to studies mainly linguistic. The defect of Sturm's pedagogy, it will now appear more plainly, was not that it excluded or ignored, but that it postponed the more liberal parts of intellectual culture; that it severed too sharply the *artes sermocinales* from the *artes reales*. Substantially, the ten classes of the school—it is with them that we are concerned—were for the former; the latter had their treatment, for the most part, in the lecture-room.

Decima—or, to use English names, the tenth class—formed a sort of preparatory school to the *Gymnasium*. In it, after reading—learned partly from the German Catechism, partly (and this is what Sturm himself advised), from Latin paradigms (!)—writing was taught; in it, too, the child got entrance to the Latin language, voicing it in pure "Roman," not in German, sounds. For grammar Melancthon's was at first the text-book; it afterwards yielded place to the "Educatio puerilis Linguae Latinae" of the Strassburg *praeceptor* Golius. As a reading book a selection of Cicero's "Letters" served until the "Neanisci," colloquies prepared by Sturm, supplanted it. The method of instruction is interesting. The little boys, of course, could not at once translate Cicero for themselves: the teacher construed a passage to them and caused them to decline the nouns and conjugate the verbs that occurred in it. Lists of words had to be got by rote, and the "Neanisci" supplied a *copia verborum* for Latin conversation; for it was Sturm's resolve that his boys should not only learn to speak Latin, but should speak it as soon as possible. Accordingly he equipped them with the names of the common objects about them, whether in playground or church, in school-room, kitchen, or cellar. Latin was to be a living language acquired and used like a second mother tongue. In every class throughout the school a boy had to keep his *diarium*, or book in which the words that he had got were entered day by day under subject headings. The diet of childhood in the ninth class was much as in the tenth, with a garnish added of all the anomalous and irregular forms. In the eighth, Latin, as before; grammar had to be studied more systematically; rules were in Latin, which now began to be the language of the school. It is not, however, of Sturm's institution that the Draconic law is recorded: "Vernacula lingua loqui in ludo nostro piaculum est atque non nisi plagis expiatur." The seventh was the class in which the boys entered on syntax. Cicero's Letters or the "Neanisci" were still the reading in prose; but verse—of course, the "Disticha Catonis"—was added. In the sixth syntax was finished, prosody was commenced, and part of Sturm's anthology, "Poetica Volumina," read, translated into German, and committed to memory. The "Andria" of Terence superseded the "Neanisci" as a model for conversation, and Greek now joined Latin as a subject of instruction. The fifth pursued further the study of Latin verse and Greek grammar. For the former the learner had the "Tabulae Murellii" to assist him; he made acquaintance with poetical mythology, and he put dispersed elements of verses into place again. His reading was "Poetica Volumina" or some Eclogues of Virgil.

To rise to the fourth class, "provided with a good store of choice words, and familiar with illustrations drawn from poets and with a greater number still from orators," was to pass to a higher division of the school; as we should say, to "upper school." The school-books will show the stages of progress. Lucian's "Dialogues of the Dead" appeared in the fourth; Isocrates or the easier speeches of Demosthenes, as also the so-called "Aurea Carmina Pythagorae," in the third class; the

"Cyropaedia" in the second; and Thucydides in the first. But in these higher classes the speeches of Cicero were the staple commodity. These and whole books of Virgil were memorized and recited in form. It would, however, fill a volume to tell all about Sturm's famous school, and its character will be growing clear. But, whatever, for the sake of brevity, be omitted, there must be mention of the plays. The removal to the Monastery of the Dominicans was celebrated by a performance of the "Anabion"—a dramatic treatment of the raising of Lazarus, by the then living Johannes Sapidus. But no Biblical story or moral meaning could commend the Latinity of the moderns to the Rector; better an unchaste plot in chaste speech than Christian sentiment communicated by means of debased words. Representations of mysteries or moralities enjoyed no favour under his rule; on the other hand, Plautus and Terence were both learned by rote and acted on the stage. The *decuries* into which the forms were divided had to learn each its play; and Sturm held it to be possible and desirable for the first four classes to master in this way the whole of the two dramatists in a year, or even in six months. Had he not himself, when a boy, acted Geta in the "Phormio" before St. Martin's Church at Liège, to the lasting benefit of his scholarship?

These *decuries* were sets of eight or ten boys, subordinated to a *decurion* or *ensor*, who exercised a disciplinary control over his charges. Annual promotions took place; and there were speech days, at which prizes were awarded. But any might dispute in a Latin speech the successful candidate's title to the reward. Good-conduct money (saddest of all inducements to virtue) aided the authority of the teacher, and let him close at times the Janus temple in which his arms lay.

From the school let us look a little more closely to its begetter. Sturm is described as "a man of medium size, dark and ruddy complexion, firm features, long beard, clear and well modulated voice, dignified presence, and a somewhat slow gait." Attractive as a lecturer, he had small part in the teaching of the school, being one of those head masters who boast themselves to shine as organizers and supervisors. A notable man in his generation, he engaged himself in diplomacy, and found it a pitch from which it was hard to bring back the hands undefiled. Still more prejudicial to his welfare were the theological studies that occupied him much in his later years; for he was led by them to champion an unpopular cause, and his adversaries prevailed. "On account of age and for other reasons" he was dismissed from the rectorate in 1581, retiring to his Tusculum at Nordheim, where he lived in poverty, loneliness, and partial blindness until, in his eighty-second year, death released him from these evils. His latest pleasure was not in pedagogy, but in hurling his Ciceronian phrases against the Turks and devising plans to thrust them out of Europe.

But death was not the end of Johannes Sturm. His spirit worked on after him. Even while he lived it had become usual to consult him whenever a school was founded in Germany, and it was natural that he should propose the Strassburg *Gymnasium* as the pattern to be imitated. His pupils were preferred as teachers and head masters, and themselves taught as they had learned. His influence was apparent in the School Ordinance for Würtemberg, and filtered thence into that for Brunswick and that for the Electorate of Saxony. His countrymen hailed him as "pater scholae, Cicero et Nestor Teutonicus." And he exercised a power not confined within the limits of his native land. Sturm was even more distinctly the parent of the English public school than of the German. Ascham, his friend and correspondent, borrowed from him in the "Scholemaster." The double communication of English humanists and Reformers with the humanists and Reformers of Germany, the Netherlands, and Switzerland formed a channel through which flowed much more than we are willing to own. England imported a school from Strassburg as well as doctrines from Geneva. Everything that characterizes an English public school on the intellectual and moral side, and even things peculiar to a few schools—the verse-making, the declamations, the play, the limited range of authors read, the books of Virgil learned by heart, prefects or monitors, apposition (once a fact if now a name), good-conduct money—all will be found in Sturm's institution. And for three hundred years in a world of change—Latin, for example, lost all its *practical* value—the school remained almost unchanged. Then concessions were made to public urgency—some half-hearted and vain, others sincere and useful. But, on the whole, the school continued to be

given up to Sturmianism. And, lest the vagueness that has been deplored should invalidate the charge, be a definition, with however unskilful hand, essayed. Sturmianism is a mode of education under which the classical stalks masterfully among other disciplines, to take a figure from the poets, like a herdsman among sheep; a mode of education under which memory is exalted above observation, and the study of words defers unduly a knowledge of things.

A silent revolution is in progress, not perceptible in the cathedral closes where Education Bills germinate, or in the discourses of our clerical head masters—nothing revolutionary there—but with its stages, nevertheless, reported in journals and its surging manifest throughout Continental Europe. In Russia it overthrows ministers. Germany holds out her sign of it in the struggle, already in large degree successful, to win for the *Oberrealschule* and the *Realgymnasium* a parity of right with the *Gymnasium*. In France, delicate barometer of European thought, it is shown by the resolution of the *lycée*, long the jealously guarded preserve of the classics, into sections, among which the classical is not even a much favoured choice. To-day Greek is the chief object of assault; to-morrow it will be Latin. The demand is for what are called modern subjects, but principally for science, and for the education that depends less on *remembering* than on *observing*. Sturmianism is being challenged in respect not only of its methods, but also of its root matter. If the revolution fulfil itself, science will depose classics from its sovereignty in the school.

Soon the English public school will have to consider its position. When it does so, there is a grave question, not proper or likely to be overlooked. The movement in France must be interpreted by means of other facts, and, so interpreted, reveals itself as associated with an attack on religion. But is the local phenomenon decisive? Is there a necessary opposition between religion and science—a necessary connexion between classics and religion? Has religion any more cause to fear science than science has to fear religion? Perhaps competence will presently sit in inquiry and tell us with authority whether science, urging her claims with marvellous and awakening discoveries, might safely be admitted to the school, not with a half-churlish tolerance, but to the upper room of highest honour. Perhaps the words of the epitaph on gentle-hearted "J. G. L.,"

Religionis verae exemplar,
Carminibus Latinis amicos saepe laetificans,

may come to be regarded as a sly touch, of monumental humour rather than as a deliberate ascription of supreme holiness.

The difficulty overcome, and surely it can be overcome, science will reign. Life will ultimately triumph over dead matter, as the tree, with irresistible growth, parts the stones of a sepulchre. Johannes Sturm has done his work and may now rest.

W. G. FIELD.

THE HUMOUR OF THE SCHOOLROOM.

Of all professions that this world has known
From clowns and cobblers upwards to the throne . . .
The worst for care and undeserved abuse,
The first in real dignity and use
(If skilled to teach and diligent to rule)
Is the learned master of a little school.

ALEXANDER WILSON.

ALTHOUGH education has changed considerably—and we hope for the better—since the last days of the eighteenth century, when the above lines were written, it must be admitted that the daily life of the schoolmaster is still full of care and anxiety and much "undeserved abuse." Yet even the prosaic profession of pedagogy, like its fellow-professions, has its humorous side, and at times the dull monotony of the schoolroom is relieved by touches of genuine, though frequently unconscious, humour. Bacon has it that "the invention of young men is more lively than that of old: and imaginations stream into their minds better, and, as it were, more divinely." There is a *naïveté* born of a humour keener than that of the staid old philosopher, in these lines, and to any one conversant with the workings of the schoolboy mind they will appear delight-

fully expressive. If we make a further diagnosis of the youthful mind, we shall find very frequently that the younger the mind is the greater does the power of imagination seem to be developed. Who but the unconscious schoolboy—if we may be allowed the epithet—could be responsible for that originality so often displayed in answers to the most prosaic of questions? Definitions the explanations of which have baffled the keenest intellects of all times are treated with scant respect by the “original” schoolboy. The great question “What is truth?” had taxed the minds of such men as Pythagoras, Aristotle, Aquinas, and had remained still shrouded in mystery until it was brought into contact with the mind of a youthful philosopher of our own day. “Truth,” we now know, “is the owning up to a thing when you are found out.” Here at last we have arrived at a definite answer, and we cannot but feel that “imagination has streamed in better, and, as it were, more divinely.”

Some one once said that originality was the stepping-stone to success. We are not prepared at present to contradict or acquiesce in this statement, but all who have had any experience of the workings of the youthful mind will readily admit that it is precisely this trait of originality which goes to relieve the monotony of a schoolmaster's life—that gleam of intellectual sunlight which occasionally streams into the school-room. The imaginative boy, on the other hand, is the cause of much care and anxiety to his master; but, at the same time, he is the source of much that is humorous.

How tedious at times would be the construing of a passage from some author where the imagination not allowed its full play! The “original” boy is never conservative in his action; liberality is his birthright. The laws of consistency are unknown quantities in his life. No section of learning is sacred to him: while language, classical or modern, is a flourishing tree from which he draws much fruit. Even that dull science of facts and figures—mathematics—teems with possibilities for his genius. It was our duty recently to prepare an examination on Roman history for a class of small boys. One of the questions asked was: “What do you know of the Agrarian Laws?” They had caused no little anxiety to their originator, but they presented little difficulty to one bright youth, who unhesitatingly pronounced them to be “laws formed by some Roman or other that no woman was to drive about Rome in an open chariot unless she was going to church.” The reason for this originality has caused us much thought, but we have failed to satisfy ourselves. To another boy the “hastati” were the “blooming manhood of Rome.” Perhaps, however, of all the reforms introduced into Rome none would have been so dear to the heart of a schoolboy as the “Licinian Laws.” According to one the “Licinian Laws” were passed that “no schoolboy was to be killed or thrashed in school without his own consent.” At first we felt that our dignity was in peril, and we cross-examined the boy; but we found that the answer had been given in all simplicity. There are undoubted signs of genius in this youth, and we can prophesy him a brilliant future.

The history of the famous Gracchi was rendered very interesting from the fact that “they were two young men of the respectable ages of twenty-nine and thirty, and they had a mother whom they hated.”

We once imagined that it was no easy task to write a clear and concise biography of some great character of history, but we have somewhat modified this idea since reading a short life of Julius Caesar, written by a small boy. Future historians may learn that much new light is being constantly thrown on the lives of our great heroes. We have taken the following extract (without the author's permission) from a recent essay on Caesar:—

Caesar was called the Emperor of life because he was such a mighty powerful clever man. He is said to have been fit for almost anything. Once on the ides of March he was forbidden by his wife to go to a place called the Senate but sitting down on a chair reading a note from Brutus, Cassius came in and struck him on the head and Caesar looking up said “Thou too Brutus!” and then transpired before the statue of Pompey.

Another budding historian, viewing the same character from another standpoint, wrote: “After Caesar had received his Crudal Aedileship he lost his aunt and after conquering the Transalping Galls was stabbed in the hearth.”

We have been wont to look upon this great Roman as a man of almost infinite capacity, but we admit that it surprised us to

learn that he “was an architect, a judge, and finally a senate,” and that he once uttered “those famous words ‘vini, vidi, vice.’”

If history offers abundant opportunities for the play of the imagination, the classical languages seem to be of still greater assistance to the schoolboy for displaying originality. It seems almost a law of Nature with some boys to translate a passage from a classical author incorrectly the first time they have to deal with it. This is more noticeable in younger boys than in those of maturer years, owing, no doubt, to the fact that the younger boys have not as yet arrived at the state of being able to see certain things in their relations with other things; in other words, they have not yet learnt to think for themselves. The path of least resistance is a fundamental law with them. “Integer equus” to one was nothing else than “an equal number”; and, when remonstrated with, the boy unblushingly made answer: “Integer” means “a number” and “equus” means “equal.” Therefore—the deep sarcasm contained in that word “therefore”—the poor master quailed before the eye of that unmerciful logician. No doubt, the boy had pity on the ignorance of his master, for he quickly changed the subject.

Equally original was the translation of “felix prole virum.” What could it possibly be but the one given, “a happy man with a family”; and is it not obvious to all that the letter “P.” is an abbreviation for “pabulum,” the ordinary food of a Roman soldier?

After reading the Second Book of Caesar's “De Bello Gallico” one youth was evidently impressed by the dignity of Divitiacus, for he translated “honoris Divitiaci causa” “for the sake of Honourable Divitiacus.” On another occasion the same boy was responsible for the following:—“Nomine obsidum,” “Under the name of ostriches.” What the master had said was clear, but the word “hostage” was an enigma to him, and hence the result.

Who will dare to deny that it was a stroke of genius which made “pes” come from the verb “pum, pes, pet, pumus, pestis. punt”?

In our experience we have found that French is a good recruiting ground for originality. In an account of a young lady's travels in Corsica the phrase “Une vendette transversible” was rendered “A blood-curdling story,” and “C'est d'un sang vif” was made to mean “His temperature was above normal”—this from a boy in one of the upper forms. With regard to questions on “general” knowledge—knowledge which does not come into the ordinary school curriculum—the master must be prepared for even higher flights of originality. One of the questions asked in a paper of this description was “What are the chief Shakespearean plays?” The answer given was certainly unique: “The chief plays of Shakespeare are ‘Macbeth,’ ‘Quo Vadis?’ ‘Sign of the Cross,’ ‘Mikado,’ and ‘San Toy.’” A better example of undigested knowledge one could scarcely wish for. The scene of the next example was a class of middle-form boys, and the question was asked: “Which are the Seven Hills of Rome?” Among many varieties were the following:—“Appletine, Caroline, Epistoline, Quarantine, Cataline, Veraline, Eataline.” So happy was this class in its blissful ignorance that the recital of some of the answers produced a smile only from the more intelligent of its members.

We will conclude with a few stray examples taken from various sources, not directly connected with school work, but which illustrate the peculiar cast of mind we have been speaking of.

“A cyclone” means a “bicycle with four wheels”—at least, we are so informed; whilst a “widow” is a “she bachelor.”

As a relaxation one day the master had described the conditions of prison life in Siberia, and had depicted graphically the horrors of the *knout*. On questioning the class afterwards about the subject of his story he casually asked one boy to tell him what a *knout* was. Judge of his surprise when he heard that the *knout* was a vulgar word commonly used in Lancashire and meant “nothing.”

On a certain morning an examiner went to a class fully prepared, as he imagined, for the most startling examples of schoolboy perversity; but he was hardly prepared for the answer to his very first question. Going to the blackboard, he proceeded to explain a simple sum in arithmetic. “What am I to do next?” and quickly came the answer: “Add up the giblets, sir.” We need hardly say that sum is not yet finished. These, then, are a few examples taken haphazard from a

schoolmaster's note-book. The life of a pedagogue may, it is true, be full of care and "undeserved abuse," but, after all, there are occasional humorous moments even in the most uninteresting class of boys it may have been our lot to teach. May it not be that the master learns much during these moments? It often happens that these very mistakes are the means of allowing him to come into closer contact with a boy's mind—the means of his seeing the "other side" (if we may use the words) of his mind. We all learn by blundering, and to cleverer minds than our own we ourselves may appear quite as "original" and quite as imaginative as our pupils do to us.

J. H. OLDHAM.

A COMPARISON BETWEEN ENGLISH AND FRENCH SECONDARY SCHOOLS.*

By CLOUDESLEY BRERETON.

A COMPARISON between any branch of English education and its equivalent in some foreign system is always a matter of difficulty. The elasticity and variety that prevail in every grade of English education make it far from easy in many cases to say with absolute definiteness what is really typical and representative. English education—and especially that section of it known as secondary—is, like the English climate, made up of a large number of samples. If its specimens, when good, are (like the little girl in the nursery rhyme) "very, very good," it is no less certain that, when they are not, they are "horrid" enough in all conscience. Happily the selection of normal types is far less arduous in the case of the French schools, owing to the uniformity of standard which State control naturally produces. Still, it is always possible for a foreigner, even when he has gone through a French school and a French University, to fail to do justice to the French point of view. None the less, I feel certain that my French friends in the audience, if they do not always see eye to eye with me on all points, will condone any shortcomings on my part on account of the genuine admiration I feel for the many strong points which distinguish French secondary education. Unfortunately my task is rendered still more difficult by the fact that the two countries have each been passing through an educational revolution, the effects of which are far from being as yet complete. Each educational system is, therefore, in a state of unstable equilibrium—though, no doubt, once it has found its new centre of gravity, it will ultimately come to rest in a stronger position than heretofore. In France the revolution has mainly affected curricula; with us it has been, above all, administrative. While our neighbours across the Channel have been recasting their programmes from top to bottom, we have been reconstructing and consolidating the entire system of national education, in which, for the first time, secondary education finds definite official sanction. But this acknowledgment of the duties of the nation towards the education of the people as a whole has been coupled with a most extensive measure of decentralization, by which the joint responsibilities of the localities in the matter have even more strongly been emphasized. Hitherto secondary education, except in certain subjects in science and art, has been entirely dependent on endowments, private initiative, or the doles of the more generous Local Authorities in order to work out its own salvation. Recent legislation has now made it a branch of local government, as much a matter for local consideration as the supply of good roads or of good drinking water. Our Local Authorities are thus suddenly called upon to solve every imaginable question that can be raised in connexion with secondary education.

I propose to begin by comparing the relationship of the schools in the two countries to the Central Authority and to the locality. In France the State schools, whether *lycées* or *collèges*, stand in very close and intimate connexion with the Ministry. The *lycée* is wholly controlled by the Central Authority, while, even in the case of the *collège*, the locality has but little part in the management of the school, except as regards the financial arrangements. Recently an attempt has been made

to encourage the locality to give a certain local colour to the *collège* within its borders by subsidizing special courses of instruction in practical subjects. But, in spite of this new departure, the Central Authority still exercises an overwhelming control. The private schools are likewise, to a certain extent, under Government supervision. The principal must be at least a *bachelier*, and the buildings open to sanitary inspection. All this is plain sailing; but when we come to England we find no less than three categories of public secondary schools, with varying degrees of central and local control. First, we have those endowed schools which receive no public money at all, each with a scheme of its own, which is practically a charter, under which it is managed by a body of governors. The Central Authority can revise its scheme; but in practice it is to all intents independent. In the next category come those endowed schools, also under governing bodies, that receive aid from the Central Authority, which in turn inspects their work, and thereby controls their curricula. And, lastly, we have those endowed schools which receive not only grants from the Central Authority, but also from the Local Authority, as well as the schools which these Local Authorities have founded and maintain. This last-named category of schools is thus under the *condominium* of the Central and Local Authorities. The private schools, which are also lumped together with the secondary schools in the only official census taken of secondary education, include schools of every possible type from the kindergarten upwards. So far they are entirely free from public oversight in respect either of teaching or of sanitation. As Matthew Arnold has said, there is nothing to prevent a ticket-of-leave man from running a private school if he likes.

Obviously the central control as exercised in France secures certain great advantages. It ensures the public secondary schools being officered by a thoroughly qualified staff corps of teachers and supervised by a body of competent and experienced inspectors. The result is the attainment of a uniformly high standard of intellectual efficiency in the State schools with which our public schools in the bulk can hardly offer a comparison. On the other hand, the freedom enjoyed by our schools has saved us from the opposite dangers of excessive uniformity and tied our hands less in the making of new experiments. But the quarter from which we hope to see the greatest progress is the locality itself, which has now a definite voice in the management of many of the schools. As M. Ribot has said: "On connaît mieux sur place ce dont la localité a besoin."

I now pass to the position of the head master in the two countries. The French *proviseur*, or *directeur*, is the administrator of the school, the titular head of the teaching staff. He has two other officials at his side—the *censeur*, who looks after the discipline; and the *économiste*, who acts as bursar or steward. His position, once regarded as highly desirable, seems to have become less attractive of recent years. His powers of initiative are strictly limited and his control over the staff very slight. These defects have been much felt of recent years; and in the new so-called *lycées autonomes* he is more like a real commander-in-chief than merely *primus inter pares* among the other officials and professors. For instance, the boarding arrangements are in his hands; he has the right to expend any unexhausted balances, and can organize the discipline of the school on what lines he pleases. Still, when all is said and done, the English head master in a public school has far more extended powers. He is often a veritable *pontifex maximus*, in comparison with whom the French educational chief is a mere *rex sacrificulus*. He has no *censeur* on his right hand with whom to share the power of the *fascies*, no *économiste* on his left with whom to divide the management of the school *aerarium*. His power over his assistants is, at least in theory, absolute. He can dismiss at three months' notice, without cause assigned, a master who has served the school faithfully for thirty years. No doubt, these extreme powers are at times abused; yet the system has its merits: without freedom there can be no responsibility.

Nothing shows more clearly the different stress laid on education in France and in England than the organization of the teaching profession in the two countries. The French in insisting on the importance of intellectual attainment have deliberately divided up the dual function of the educator between the professor who does the teaching and the usher or *surveillant* who looks after the pupil in playtime and preparation. One of the results of this division has been the production of a strong body

* Lecture delivered to the students at the London University Holiday Course, August 8, 1904.

of highly cultured and admirably equipped teachers. No doubt we have many capable masters in our schools, but, taking them through and through, the level of the teacher's attainments is nothing like so high as in France. On the other hand, there are signs that this division of pedagogic functions between two sets of persons is not altogether for the best. Moreover, if stress is laid on the training of character and of the will, it is obvious the two parts must be doubled by one and the same individual, as is always the case in England. But when we compare the position and prospects of the French teacher with those of his English colleague we find that the former, as a rule, enjoys a far more favourable situation. In England there is no definite security of tenure. In but few cases are there any prospects of a pension. Some masters are more highly paid than any in France, and a favoured few who keep boarding establishments may accumulate a decent fortune; but, if there are a few bigger prizes in the English profession, there are far more blanks, and many salaries in the smaller grammar schools scarcely provide a living wage. Moreover, the hours of work are longer. Some Frenchmen grumble at the excessive number of twenty hours a week. Many English masters have nearer thirty. And, finally, their position in the social scale is not so high. Mr. Benson, who belongs to a big school, rates the schoolmaster as a second-class gentleman; the first class being occupied by the representatives of the Army, Navy, Civil Service, and land agency! In the smaller schools the teacher probably does not rank above a curate. In France the prestige of the State teacher and his official standing make him a highly eligible *parti*—especially in the eyes of those mothers who wish to choose a steady man for their daughters—in the same way as some mothers in England have a distinct preference for a clergyman. On the other hand, the English master—except in a few schools—is often condemned by straitness of means to celibacy; his only consolation being that of acting as a foster father to other people's children! With the stress that they thus lay on intellectual attainment, the French have naturally pushed the system of specialist teachers much further than we English, who have probably gone too far in the opposite direction in expecting our so-called form masters to teach subjects in which they were not really capable—such as modern languages. On the other hand, with specialists throughout the school, the classes are apt to become like sheep that have no shepherd; while the shepherds themselves are reduced to the position of drovers who barely know by sight the numerous flocks entrusted to them. The German system of having regular class professors combined with specialist teachers seems to obviate to a certain extent the difficulties inherent in the English and French systems. Still the German *Ordinarius* does not quite fill the same position as the English form master. He does, indeed, act *in loco parentis* towards the boys; but he does not share their life out of school, as a sort of elder brother and Mentor combined, as the English master often does.

Coming to the internal economy and administration of the school, one may notice one or two interesting points of difference. In France the year's work of each class is mapped out and defined: there is little or no overlapping between the work of the different classes. In England each school, being more or less free, can allot its work as it pleases, have as many or as few intermediate classes between the top and bottom of the school, and call them by whatever names it likes. Hence, while promotion on the Continent is practically a yearly matter, in an English school a clever boy can hop, skip, and jump up three, or even more than three, classes in a year, especially in those schools in which the curriculum has not been arranged on the plan of the pupil being obliged to master every jot and tittle of each section in succession. In a word, the promotion is by *ability* rather than by knowledge—a very important distinction. The system is undoubtedly bad for the weaker vessels, who require a curriculum in which everything is carefully arranged from start to finish. On the other hand, it enables the bright boy in classics to come more rapidly to the top of the school. Such methods of promotion undoubtedly tend to disarrange the work of the classes and render it more difficult. Hence, in some schools the pupils in the upper classes are often reclassified in different *sets*, according to their attainments. Thus, a sixth-form boy in classics might, if less advanced in other subjects, be in the fifth set in mathematics and in the fourth in French. The defect of this system is that, if employed too freely, it breaks up the classes and renders them

less homogeneous than they ought to be. Its increased costliness is also against it. On the other hand, it renders the English teacher's task less difficult with the duller boys than that of his German colleague, who has to bring his pupil to a certain level in every subject; while, if properly managed, it possesses all that is best in the *allgemeine Bildung*, while safeguarding the school against the dangers of too large an application of the principle of elective studies, which at present dominates American education.

The French system, with its regular programme, thoroughly efficient staffing, and capable inspectorate, has one great merit. It renders superfluous all *external* examinations except at the end of the school career. The English boy is harassed throughout his whole school life by a series of external examinations, which we must modify or abolish as soon as possible. The result is that, instead of the curricula controlling the examinations, the examinations control the curricula. Historically the present chaos is explainable on *laissez-faire* grounds. The English school has been largely a close borough, whose workings were unknown to the public. Hence the desire for a public audit, which only an external examination can give. Again, the English master's class-room was until recently his castle, into which the head master rarely, if ever, penetrated. Hence the need for the head master himself to know what was going on inside his subordinate's stronghold.

In France, again, they have managed to devise one single leaving certificate, the *baccalauréat*, which is at the same time an "Open, Sesame!" to all the professions. In England not only has each University its own entrance examination, but some of the colleges have an extra one into the bargain. Moreover, there are at least twenty professional bodies that have instituted special entrance examinations of their own. Can you imagine the chaos that the preparation for these different examinations produces in the schools? Happily, within the last three weeks, the Consultative Committee has reported in favour of a single leaving certificate for pupils of eighteen and nineteen, with another for those who leave at sixteen. The French *baccalauréat* is held by the University; but allowance is made for the pupil's performance at school by the production of the *carton scolaire*, or school record. It seems probable that we shall finally adopt in England a form of examination in which the teacher takes a more active part in the proceedings, and thereby approximate more to the German method. There are, however, still a good many people in England who think a teacher should not be allowed to brand his own herrings.

But the superiority of French methods of examination over English does not end here. Our examinations are still far too much a matter of memory. They are, in a word, an audit of knowledge; at their worst, a mere audit of facts. The competition is, above all things, a match against time. The pupil who can disgorge the greatest quantity of facts in a given time comes out top. Questions of style (except in Latin or Greek prose), of composition (in the large sense of the word), are of secondary consideration; whereas, if I understand the French system aright, it is just these very *constructive* qualities to which most value is attached. I will deal with the question of technique later, but surely the broad difference between the two is the difference between the copyist, the reproductive workman, on the one hand, and the architect, the master builder, the original designer, on the other. Moreover, the French examination itself is a valuable exercise. The English examinee writes on the assumption that he is writing for one who knows what he ought to say and only wants to verify his facts. The French examinee writes from the point of view of one who wants to explain to the ordinary cultured person what he has to say. Obviously, in real life the first method does not possess the same utility as the second. No doubt there are certain dangers attached to the French system—everything is fraught with danger in this world—and a skilled rhetorician may be able to dazzle the eyes of his examiners and thereby conceal his lack of depth or grip of the subject. We don't want to breed writers of the type of Lord Brougham, of whom it is said he used to get into a bath of rhetoric and splash about. Again, the French, in maintaining the oral side of their examinations, have held fast to an indispensable test that we have largely rejected because of its alleged uncertain nature. It was supposed to be unfair to nervous candidates. I am, however, one of those persons who do not understand why allowances should

be made for nerves in the examination room when they are never made in real life—nor even in games either, for the matter of that. The batsman who gets out from funk has no second chance. Personally I attach such a high value to presence of mind that I am delighted to think that a quality far more valuable than mere memory can be, to a certain extent, tested by examination. Of course, if examinations have no connexion with finding out those who are going to do something in the world, I wash my hands of them entirely. I cannot understand the position of those who separate education and life—to which it should be a preparation. Happily the direct method of teaching modern languages is likely to lead to the rehabilitation of oral examinations in England in the near future.

(To be continued.)

THE COMPOSITION OF THE NEW EDUCATION COMMITTEES UNDER THE EDUCATION ACT, 1902.

Introduction.

THE most important preliminary duty imposed upon Local Authorities by the great Education Act of 1902 was the constitution of Education Committees. This involved first of all the preparation of schemes for submission to the Board of Education for its approval. From the last official "statement" it appears that only four of the total of 333 Local Education Authorities in England and Wales had not then submitted schemes to the Board, and only fourteen of the total number of Authorities had then received the Board's approval of their schemes. According to the Annual Report of the Board, issued last September, the Act would be put into actual operation throughout the entire country during that month. It is possible, and not premature, therefore, to draw attention to certain important facts brought out by a study of the schemes in bulk.

General Classification of the Schemes.

The National Association for the Promotion of Technical and Secondary Education have taken some pains to classify the statistics in all the six "Statements of Schemes for the formation of Education Committees" issued by the Board of Education, and the results are published in their quarterly *Record*. The following tabular summary embodies the statistics in a very useful and interesting form. It shows at a glance the relative position that the Local Education Committees established under the Education Act (including also a few minor Authorities with concurrent powers) hold respectively in the matter of the appointment of non-Councillors, otherwise dubbed "outsiders," including the co-optation of women members:—

Local Education Authorities.		Education Committees.			
	No. of Members.	No. of Members.	Coun- cillors.	Non-Coun- cillors.	Women.
53 Counties	4,112	2,216	1,554	622 including	128
65 County Boroughs.....	3,324	1,881	1,220	661	115
129 Boroughs over 10,000 population	3,383	2,529	1,614	915	196
58 Urban Districts over 20,000 population*.	1,019*	1,110*	699	411	74
22 Minor Authorities with concurrent powers Section III.	386	348	196	152	33
Totals (332 Authorities)	12,224	8,084	5,283	2,801	546

The Proportion of Municipal Members.

In the first place, it is quite clear from the above summary that, taking the country as a whole, the County and other municipal Councils possess a very substantial majority upon the new Education Committees. The proportion of municipal members proper actually works out at 66 per cent., or nearly two-thirds, of the total number of members. This should surely

* The number of counties excludes London, but the Isles of Scilly are taken as a separate county. As regards the urban districts, in 24 cases the numbers of the members of the Education Committees exceed those of the Local Education Authorities themselves.

give complete satisfaction to all those who have so strenuously advocated for years the municipal control of all grades of education. The use made of the guidance and power afforded to Local Authorities by Clause 17 (3) (a) of the Act is now seen: this simply provides "for the appointment by the Council of at least a majority of the Committee." Thus, it may be claimed that, in at least one particular—in respect of the proper apportionment of Councillors to non-Councillors—the constitution of Education Committees has been generally carried out in full accord with the letter and spirit of the Act.

When the composition of the Committees appointed respectively by the different Local Education Authorities is considered, some divergence in the proportion of municipal members is naturally expected, and, significantly enough, this divergence moves in an anticipated direction. The summary shows that the Education Committees in the administrative counties are composed of the largest proportion of municipal members or members of the Local Authorities; these members stand to non-councillors in the ratio of seven to three. In the face of these figures it should be borne in mind that the clause of the Act already quoted entitles the County Councils to determine whether the persons to be directly appointed by them shall or shall not be their own members.

Excluding London and two or three recalcitrant Welsh Authorities, there is no County Council in England and Wales who have, however, chosen the entire Education Committee from among their own members. On the other hand, all have sought the assistance of persons generally recognized as experts by reason of practical experience in various kinds of educational work.

As regards Local Education Authorities other than County Councils, it is worthy of notice that the proportion of municipal members on the Committees gradually decreases with the size of the Authorities, until, coming to the minor Authorities, the ratio of Councillors to non-Councillors is found to stand at about eleven to nine respectively.

The following summary indicates in percentages the proportion of municipal and outside members appointed respectively on the Education Committees by the five kinds of Local Authorities:—

AUTHORITIES.	COUNCILLORS.	NON-COUNCILLORS.
Counties	70	30 per cent.
County Boroughs	65	35 "
Boroughs	64	36 "
Urban Districts	63	37 "
Minor Authorities.....	56	44 "

While not saying anything in the way of disparagement of the past educational work of either kind of authority, it is evident from the above figures that there is less *guarantee* of efficiency as educational bodies among the smaller authorities. This may be fairly inferred not only from the opinion of the Board of Education, as evidenced by their approval of the Local Authorities' schemes, but also from the action of the Local Authorities themselves, as evidenced by the policy generally adopted in framing the schemes. And it is made more obvious from the fact that in administering higher education the County Councils naturally obtained a different—i.e., a wider—perspective of educational work than the minor Authorities who, under the late Technical Instruction Acts, were pinned to the regulations of, and largely dependent upon the grants from, the County Councils.

The Lesson of the Old Technical Education Committees.

The Board's "Statements of Schemes" indicate generally what *forms* of educational experience are to be represented on the respective Education Committees. But it is a pity that the *extent* of the representation granted is not given at all completely, or, in other words, the actual number of representatives awarded to the various "educational interests." The individual schemes, as finally approved by the Board of Education, would alone indicate this point authentically and in detail.

It is interesting to recall the fact that, just prior to the passing of the Education Act, 1902, the National Association made a serious effort to ascertain the composition of the old Technical Education Committees (of the major Local Authorities) who had been in existence from 1890. This was undertaken with a view of finding out how far the members of those bodies were actively concerned with the administration of elementary, secondary, and higher education. The result of the inquiry was to fully

prove the educational status and identity of the Committees as a whole. This applied even to the County Councils, whose Technical Education Committees, with a very few exceptions, were composed entirely of their own elected members, and not, as was the case with the county boroughs, where four-fifths of the total number of the Committees were of the hybrid character, *i.e.*, included the direct representation of outside interests.

Here is a brief summary of the chief facts revealed by the inquiry. Taking thirty-seven counties, practically one-half of the total number of the members of the Committees were actively associated with elementary education, or, in other words, were concerned with the management and control of what are now known as provided and non-provided schools. A small half (or 46 per cent.) were associated with public secondary schools; 13 per cent. were connected with higher institutions, and there was also fair representation of the teaching profession. Taking forty-nine county boroughs, the proportion of members associated with elementary education fell to under 25 per cent., or one-half of the figure for the counties; and of those connected with secondary schools to under one-fifth of the total number of members; while the proportion of those associated with higher institutions was the same as in the counties; there was also a fair, or even a better, representation given to the teaching profession.

It would be absurd to disguise the fact that these figures show clearly enough that the old Technical Education Committees of Local Authorities would have been quite capable of administering all grades of education—at any rate, with only a slight extension of the principle of co-optation in some cases, and with a larger extension of the total membership in others. It is not hard to see that procedure has followed very closely upon these lines under the provisions of the Education Act, 1902. It may be stated, too, that the true inwardness revealed by the National Association's inquiry was brought home before the Act was placed upon the Statute Book. The actual procedure in regard to the constitution of Education Committees is now a matter of common knowledge. They are established by the Local Authorities themselves, with the approval of the Central Authority; but, to make doubly sure the assurance of educational efficiency, the co-optation of experts with practical experience in and acquaintance with all types of schools is freely adopted, or, in the words of the Board of Education, this requirement of the Act has been "strictly observed."

The Appointment of Women Members.

There remains for consideration the question of the appointment of women members upon the Education Committees—an important question in many respects, and one which does not appear to have received sufficient attention.

From the statistics already given in the tabular summary of the "Statements of Schemes" issued by the Board of Education it appears that the proportion of women included by co-optation on the Education Committees to the total number of members ranges amongst the different Authorities from one in every seventeen to one in every ten. The largest proportionate numbers of women members are found in the boroughs and amongst the minor Authorities, and the smallest proportionate numbers in the counties and the county boroughs. Again, the proportion of women members to the total number of non-Councillors or outsiders, roughly speaking, works out at one in every five in the counties and one in every six in the county boroughs and urban districts.

The terms of the Act, as set out in Clause 17 (3) (c), are not explicit respecting the minimum numbers of women to be appointed upon the Education Committees. They simply provide "for the inclusion of women as well as men."

In the explanatory circulars, issued early last year to Local Authorities by the Board of Education, in regard to the framing of schemes the statutory number of women to be appointed was fixed at the lowest possible figure—a unit. Taking the country as a whole, this explanation has been generously interpreted by Local Authorities, and, when all things are considered, with good reason. The Board of Education's minimum has been exceeded by more than half of the Local Authorities, *i.e.*, by 187 out of 332. Of the former number, 168 have included two women on their Education Committees; nineteen Local Authorities have appointed more than that number, as the following list shows:—five women members (2)—Breconshire, Worcestershire; four (3)—Hampshire, Somerset, Radnor-

shire; three (14)—Birmingham, Devon, Essex, Leeds, Liverpool, Manchester, Merionethshire, Middlesex, Norfolk, Salisbury, West Sussex, Trowbridge, Uttoxeter, Yorkshire (North Riding). It is worthy of remark that this list includes several of those Authorities who gave considerable attention to the education of girls in administering the late Technical Instruction Acts.

The Need for Larger Representation of Women.

This action of Local Education Authorities is satisfactory so far as it goes, and shows the existence of a real desire to recognize the valuable, and indeed indispensable, aid women can render on the statutory Education Committees. It does not, however, go nearly far enough to meet the crying needs of the case. The presence of women has been found to be essential to the success of elementary education under the now defunct School Boards, and of a great deal of the delegated work in connexion therewith. But there is a further argument in favour of the larger representation of women's interests. Prior to 1902, the Local Authorities in twenty counties and county boroughs placed women upon their Technical Instruction Committees. The total number of women so appointed was 64, and upon sub-committees 104 women were appointed: these were to serve in a strictly limited sphere of educational work. Now, under the new Act, in the areas of 332 Local Authorities, covering the whole country, there are only 546 women appointed on the Education Committees, to whose operations there is no limit: there are, of course, no figures yet available as regards women serving upon sub-committees. Bringing these figures down to a simple comparison, it appears that formerly with the old Technical Instruction Committees (excluding Sub-Committees) the number of women per Committee was 3·2; with the new Education Committees the number is only 1·64.

It is thus quite obvious that the presence of women will be required on the new Education Committees on a much extended scale if the manifold questions relating to female education from the infant school to the University are to be dealt with systematically.

Problems in Secondary Education for Girls.

Let the problems demanding treatment in connexion with secondary education alone be considered. It will be seen at once that such a sparse representation of women's interests is totally inadequate to keep to the forefront the need for securing additional facilities for the secondary education of girls and the necessary reforms in the existing supply of girls' schools. Some of these problems, which it was impossible to solve or scarcely to touch with the restricted powers of the late Technical Instruction Acts, may be cited here in order to give an idea of the task lying before Education Committees in this particular field.

To begin with, there is a great paucity of efficient public secondary schools for girls. In fact, in some of the more rural counties, where a really stern effort has not yet, or has only recently, been made to grapple with the problems of secondary education, such schools are practically non-existent. From this it may be rightly surmised that the number of girls receiving secondary education in the country is painfully below the average authentically estimated by expert authorities. The results of the preliminary inquiries already undertaken by certain County Councils (such as Leicestershire, Shropshire, Staffordshire, and the West Riding of Yorkshire) into the position and condition of the secondary schools, both of a public and a private character, within their areas, all point unmistakably to this conclusion. To increase the number of girls' secondary schools is, therefore, an immediate duty. What makes it an imperative one is the method now advocated by Central and Local Authorities alike that all primary teachers should receive a few years of their general education in secondary schools. And still more so when it is considered that female pupil-teachers are more numerous than male. The number of secondary schools for girls should, therefore, exceed that for boys if this method of training is to be effectively carried out; but the very reverse is, unfortunately, the case.

The extension of the provision of all classes of scholarships for girls is greatly needed. This would doubtless exercise an immediate effect upon the attendance at secondary schools. Under the old conditions dominated by the Technical Instruction Acts, thirty-eight of the English County Councils threw open some

(Continued on page 32.)

NEW & SPECIALLY RECOMMENDED SCHOOL BOOKS

PUBLISHED BY HORACE MARSHALL & SON.

THE NEW TEMPLE READER.

Edited by E. E. SPEIGHT, B.A., F.R.G.S., Editor of "The Temple Reader," "The Middle Temple Reader," &c.
Illustrated. Price 1s. 6d. net.

This is a book on the same lines as the old "Temple Reader," but covering even a wider field of literature. The extracts, which range from ancient inscriptions to selections from modern authors, are arranged chronologically, and the book will be found of great service as an introduction to the world's literature. [Ready.]

Recent Additions to the well known Series of "Temple Readers."

The Preparatory Temple Reader.

Edited by C. L. THOMSON, Examiner and Occasional Inspector to the Central Welsh Board. With two Coloured Pictures and numerous Black and White Illustrations. Price 1s. 6d.

This Reading-book has been prepared at the request of many teachers who expressed a desire for a book on the same lines as "The Junior Temple Reader," but suitable for younger children. It is adapted for pupils of from 7 to 10 years of age, and contains Nature Myths, Folk and Hero Tales, Rhymes and Poems, most of which are drawn from a variety of little known sources. [Ready.]

The Temple Infant Readers.

Prepared by LETTICE THOMSON, Mistress of the Preparatory Department, Kensington Gardens School, W. Price, in stout paper covers: No. I., 4d.; No. II., 4d.; No. III., 6d.

These little books are suitable for children from 6 to 7 years of age who have mastered the letters or sounds. They are well illustrated, and, as the subject-matter deals largely with Flowers, Animals, and Birds, they may be conveniently correlated with lessons on natural objects. [Ready.]

Messrs. HORACE MARSHALL & SON beg to point out that many of their books, of which only a selection is here given, fall within the list suggested by the BOARD OF EDUCATION for a FOUR YEARS' COURSE IN ENGLISH.

A Book of Ballads. Edited by C. L. THOMSON. Price 1s. 6d.

The recent Syllabus of the Board of Education for a Four Years' Course in English suggests as a subject for the First Year's study English Ballads. This book has, therefore, been compiled to meet the needs of those teachers who find it more convenient to have such a selection ready to their hands than to collect the poems from miscellaneous anthologies. [Ready early in January.]

English Voyages. Being Selections from Hakluyt. Edited by E. E. SPEIGHT, B.A., F.R.G.S. With an Introduction by Sir CLEMENTS MARKHAM. Illustrated. Price 2s. 6d.

Designed to meet the requirements of the Syllabus of the Board of Education for the Teaching of English (Second Year). [Ready early in January.]

Selections from Prescott's Histories of Peru and Mexico. Edited by S. LAMPREY, B.A., of the Maidstone Grammar School, formerly Scholar of Corpus Christi College, Cambridge. Illustrated. Price 2s.

Designed to meet the requirements of the Syllabus of the Board of Education for the Teaching of English (Second Year). [Nearly ready.]

Tales from Spenser's Faerie Queene. Arranged by C. L. THOMSON. Illustrated. Cloth, 2s. 6d.

Specially recommended by the Board of Education.

Carmina Britanniae. A new Collection of Historical Poetry. Edited by C. L. THOMSON. Price 2s.

Specially recommended in the Report of the Education Sub-Committee of the Assistant Masters' Association on the Teaching of English.

Selections from Wordsworth. Edited by E. E. SPEIGHT, B.A. With an Introduction by Dr. EDWARD CAIRD, Master of Balliol College. Price 6d.

Selections from Tennyson. Edited by E. E. SPEIGHT, B.A. With an Introduction by Miss A. J. COOPER. Price 1s.

The Carmelite Classics.

Lays of Ancient Rome. Edited by N. L. FRAZER, B.A., of the Whitgift School, Croydon. Price 6d. [Ready in January.]

Milton: L'Allegro and Il Penseroso. Edited by C. L. THOMSON. Price 4d. [Ready.]

Milton: Comus. Edited by C. T. ONIONS, M.A. Price 6d. [Ready.]

Milton: Lycidas and the Sonnets. Edited by N. L. FRAZER, B.A. Price 4d. [In preparation.]

Milton: Samson Agonistes. Edited by C. T. ONIONS, M.A. [Ready in January.]

Goldsmith: The Deserted Village. Edited by C. T. ONIONS. Price 4d. [Ready.]

Goldsmith: The Traveller. Edited by N. L. FRAZER, B.A. Price 6d. [Ready in January.]

Coleridge: The Ancient Mariner. Edited by N. L. FRAZER, B.A. Price 4d. [Ready in January.]

This New Series of "Carmelite Classics" aims at providing Standard English Texts at a low price, of attractive appearance, and containing a minimum of editorial matter. Such notes as occur refer only to such matters as pupils of school age could not be expected to know or to think out for themselves, and when quotations from Greek or Latin authors occur, they are given from Standard English translations.

A First Book in English Literature. By C. L. THOMSON.

Part I. (to Wycliffe and Langland) and Part II. (from Chaucer to Lyndsay) now ready, 2s. per volume. Fully illustrated, with reproductions from contemporary MSS. (of which transcripts are given), Portraits, &c., and containing many valuable illustrative extracts.

New Aids to the Teaching of History.

Illustrative History. I.—British and Old English Period. By E. J. BAILEY, B.A., of the Whitgift Grammar School, Croydon. Cloth, 2s. Fully Illustrated. II.—**Tudor Period.** By N. L. FRAZER, B.A. Cloth, 2s. Fully Illustrated.

This Series is intended to be used in illustration of whatever History Text-book may be in use. The many extracts given, from contemporary and other authors, supply fuller and more picturesque detail than is permitted by the limits of the ordinary text-book in English History.

Ancient History. By W. H. SALTER, B.A., LL.B., late Scholar of Trinity College, Cambridge. With many Illustrations. Cloth, price 2s. 6d.

Deutsche Sagen. A Reading Book in German. Edited by MARGUERITE NINET. Adapted for pupils in their third year. Containing five charming Stories based on Medieval Legends, and prettily Illustrated. Price 1s. 6d.

Des Vacances à Paris. By VIOLET PARTINGTON, French Mistress at the Queen's College School. Illustrated. Cloth, 1s. 6d.

Temple House, and 125 Fleet Street, E.C.

of their ordinary county scholarships to girls; but the large majority of the scholarships went to boys. Where the demand for girls' scholarships existed, the difficulty of finding suitable schools for their tenure operated against the development of the scholarship schemes in this direction. It is true that a sum of over £12,000 was annually spent by Local Authorities on scholarships for the training of girls in domestic science; but these scholarships naturally attracted a different class of girls from that which the teaching profession demands. Nevertheless, greater attention should be given to the provision of domestic science teaching as a part of the general education for girls in secondary day schools.

Amongst the other matters which cannot be more than mentioned here are: (1) the revision of the scale of salaries for assistant teachers in girls' secondary schools, many of whom are miserably underpaid, and (2) careful consideration to the health of girls during certain periods of school life, especially between the ages of twelve and sixteen years—questions which, it must be admitted, can only be fairly and conscientiously dealt with by women themselves. In connexion with (1) the interesting circular recently sent out by the Association of Head Mistresses should be consulted.

Suggested Means of Reform.

In view of such facts as these it is clear that, if a well balanced educational system is to be established in the country, the interests of women and girls must in no way be overlooked. It is not possible, and it might be impolitic at the present time, to endeavour to obtain a revision of the constitution of the Education Committees in the direction of a larger proportionate representation of women. But the composition of those Advisory and Consultative Boards or Committees who have been established in several cases to assist the Education Committees, can be altered at the will of the Local Authorities; and there seems no reason why these bodies should not exercise a powerful and practical influence upon the acts, and perhaps, at times, the policy, of the Local Authorities. Again, according to the schedule of the Act, the Education Committees also have a free hand in the appointment of sub-committees to consist wholly or partly of their own members; so that a sub-committee composed entirely of women might be formed. These are a few suggested means of reform for the purposes here advocated. At any rate, it is to be hoped that some direct means may be found of inducing the Local Education Authorities to take quick action in regard to the many important questions bearing upon the education of women and girls and to adopt cohesive plans in so doing.

JOTTINGS.

MESSRS. KEMP, publishers of the "*Home*" *Schoolastic Guide*, desire us to state that "there is no S. Kemp connected with the same." We would only remark that S. Kemp must be a past master in forgery. The receipts signed by S. Kemp and the letter addressed to us by Kemp & Co. are letter for letter in the same handwriting. We can only repeat the warning given in July against an advertisement tout who goes by the name of Kemp.

AN Italian correspondent sends us a specimen of the folly of examiners which outdoes the vagaries of the Berkshire County Council scholarship papers on which we commented last month. The following was the subject for an essay set to the pupils of a lower elementary school at Spezzia:—"Iersera, in casa di Maria, giunse un telegramma che fece pianger tutta la famiglia."

THE list of open scholarships at women's colleges gained by pupils of the Girls' Public Day School Company during the year 1903-4 gives the following results:—Clapham, 6 (one girl counts twice for Holloway and Newnham); Blackheath, 5; Oxford, 4; Notting Hill and Sheffield, 3; Nottingham, 2; Bromley, Wimbledon, Ipswich, Brighton, Norwich, Croydon, 1.

OWING to the amount of work caused by the additional educational duties transferred to the London County Council, there is an abnormal number of vacancies for clerks in the Council's service. An open competitive examination for clerkships in the fourth class will be held under the new syllabus in January next, and, for this occasion, the age limits will be extended so as to include candidates whose age is not less than seventeen nor more than twenty-four years. Officials in the fourth class commence at £80 a year and rise by £5 annually to £100. Positions in the classes above the fourth class are obtained up to the

third class (limit £150 a year) by promotion according to merit, and into the second (limit £200 a year) and first (limit £300 a year) classes according to the nature of their duties. There are also a few positions at higher salaries. Particulars as to the examination are given in the official advertisement appearing in this issue.

MRS. JESSIE WHITE, D.Sc. Lond., has, after one term's experience, resigned her appointments as Vice-Principal and Head Mistress of the Home and Colonial School Society's Training College and High School for Girls, Highbury Hill House, London, N. Mrs. White will retire at the close of the spring term.

MR. ARNOLD FORSTER has published an expurgated edition of his "Citizen Reader," from which all the paragraphs relating to the "hungry forties" have disappeared; and, in a letter to the *Westminster Gazette*, he defends the change on the ground that all contentious political matter should be excluded from school books. We agree in the principle, but certainly not in the application. It is quite possible, as Mr. Gardiner and Mr. Bright have proved in their "Histories," for strong politicians to give a plain narrative of facts without political bias. If the pupil is to hear nothing of the Corn Laws and their abolition while fiscal reform is a burning question, Mr. Forster ought, in consistency, to exclude all reference to the Reform Act in view of a Redistribution Bill.

THE Teachers' Registration Council issues a reminder that teachers who wish to register under the "grace clause," i.e., ten years' service without academic qualifications, must send in their applications before March 5 of this year.

P.P. SENDS us a double French howler from "Famous Sayings" that matches our German *beim Biere*:—

"Tel fut cet empereur . . .
Qui rendit de son joug l'univers amoureux;
Qu'on n'alla jamais voir sans revenir heureux."

—"Such was this emperor who released the amorous universe from its yoke, who was never visited without a happy return."

A CLIMAX has been reached in Essex, where, owing to the impossibility of getting teachers, the head master of one school found himself alone with 250 children. The school was closed. At Swanscombe, in Kent, the same condition is reported.

MR. PUNCH finds something humorous in the decision of the Hampshire Education Committee to provide "one rod for each pupil." The dictionary says that there are 160 rods to an acre.

THE *Birmingham Post* gives a full and technical description of a new air-gun for miniature rifle shooting that will enable schools, hitherto deterred by expense, to introduce this form of sport. It is called the Britannia Air Rifle.

THE Treasury has raised the contribution of men teachers to the Deferred Annuity Fund by 5s. a year. This course is authorized by the Act when the average salaries of teachers have increased by 10 per cent. over £119. The average now for the statistical year 1902-3 is £131.

THE *London Education Gazette*, being the official organ of the London Education Committee, has received an additional grant from the County Council of a sum not exceeding £1,000 per annum for the insertion of matters of interest in all grades of education and for the issue, four times a year, of a supplement containing information of permanent interest and value.

A LADY student at the London Polytechnic may possibly be the pioneer of a new industry for women. She is the only lady amongst six hundred students in the practical building classes, and intends, when she has passed the examinations, to become a builder.

THE growth of the demand on the part of women for facilities of higher education is shown in Berlin, where there are 619 women students at the University. Of these 160 are foreigners.

BERLIN UNIVERSITY, according to the recently published *Year Book*, contains 7,774 matriculated and 1,330 non-matriculated students, classed as follows:—Philosophy, including Philology and Natural Science, 3,572; Medicine, 1,111; Law, 2,756; Theology, 335.

THE scholarship of £30 annually, offered by the Clothworkers' Company to a University candidate taking the teachers' training course of the Maria Grey College, Brondesbury, N.W., has been awarded this year to Miss Janet Johnston, of St. Hugh's Hall, Oxford.

|---|---|---|--|

The Maps in this Atlas incorporate the results of recent scholarship, and have been most carefully prepared so as to accentuate all the chief names and natural features of the countries, and by eliminating those of minor importance to avoid overcrowding. The use of colour contours, whilst displaying the configuration of the countries at a glance, enhances the effect of simplicity, which cannot be achieved in maps where the old-fashioned method of hachured mountains obscured the names. A complete Index adds to the utility of the volume, and the low price at which it is published (6s.) brings it within the reach of all Classical Students.

HISTORY.

By C. R. L. FLETCHER, M.A.

AN INTRODUCTORY HISTORY OF ENGLAND.

Part I.: From the Earliest Times to the End of the Middle Ages. With Maps and Plans. Demy 8vo, 7s. 6d.

A SCHOOL HISTORY OF ENGLAND.

From the Earliest Times to the Accession of King Edward VII.

SECOND YEAR OF PUBLICATION.

SCHOOL:

A MONTHLY RECORD OF EDUCATIONAL THOUGHT AND PROGRESS.

EDITED BY R. B. LATTIMER, M.A. PUBLISHED BY JOHN MURRAY. Sixpence net. Annual Subscription, 8s. post free.

The Publisher will be happy to send a Specimen Copy free on application.

The object of "SCHOOL" is to keep in touch with all developments of Education; to give its readers an interest in the questions which the recent change of system has inaugurated, and in the efforts made towards the solution of the problems of the day.

It is hoped that teachers, pupils, and the general public will find in its pages a stimulating record of progress, and useful and healthy practical assistance in the science of teaching.

Many of the leading educational experts have expressed their sympathy with "SCHOOL" and its objects, and special articles are being contributed from time to time by acknowledged leaders of thought in their own particular branches of Educational Science.

LONDON: JOHN MURRAY, ALBEMARLE STREET, W.

MR. JOHN STRUTHERS, C.B., has been appointed Secretary of the Scotch Education Department and Director of Higher Inspection in Scotland, upon the retirement of Sir Henry Craik, K.C.B., which took place on December 22. Mr. George Todd, I.S.O., is appointed First Assistant Secretary; Mr. George Macdonald, Second Assistant Secretary, with headquarters in Edinburgh.

THE President of the Board of Education has appointed Dr. Norman Moore, M.D., F.R.C.P., to be a member of the Consultative Committee *vice* Prof. Bertram C. A. Windle, M.D., F.R.S., who has resigned his membership upon appointment as President of Queen's College, Cork.

MARIA GREY TRAINING COLLEGE.—The results of the Cambridge Teachers' Examination in December were very satisfactory. Of the seven students who entered, none failed. Three obtained Class I. in Practice, and one of these three also obtained Class I. in Theory.

DR. WARRE, of Eton, has taken a house at Finchampstead. A native was asked who the new tenant was. "I dunno his name, but I hear it's a schoolmaster as used to keep a school somewhere near Lunnun."

AMONG the events of the New Year we omitted to note that Eton is submitting itself to inspection. The three inspectors nominated by the Joint Board are Canon Bell, Mr. H. W. Eve, and Dr. Kirkpatrick.

ON November 18 the School Nature Study Union held its first monthly discussion meeting at the College of Preceptors. Miss C. Von Wyss, of the London County Council Day Training College, read a very able paper on "What is Nature Study?" There was a good attendance, and the opener's remarks provoked a very spirited discussion, in which the following took part:—Mr. C. B. Gutteridge (in the chair), Rev. C. Hinscliffe (hon. sec.), Miss Hall (Stepney Borough Museum), Messrs. Lewis and Wilkes (executive), Miss Holmer, and others.

WE are glad to learn that the Association of Preparatory Schools has voted a gift of £50 to the Art for Schools Association, who are just now making a strenuous effort to clear off their debt. They appealed in the *Times* of October 11 and 27 for donations to the amount of £500 and a hundred new subscribers. We understand that the money already received reduces their debt from £500 to £300. It is to be hoped that when the Christmas strain is over the deficit will be quickly made up.

UNDER Regulation 5 (2) (a) of the Teachers' Register there has been a sudden accession of "exceptionally qualified teachers," which, if we may hazard a conjecture, is connected with the Chairmanship of Canon Bell—Dr. E. E. Abbott, Mr. H. W. Eve, Dr. Furneaux, Mr. H. G. Hart, Mr. H. Millington, Dr. Percival, Dr. Rutherford, Mr. A. Sidgwick, Dr. Wickham, Dr. J. M. Wilson. We hope to see shortly a corresponding list of exceptionally qualified women teachers.

MR. FRANCIS DARWIN corrects a rash statement in the *Times*. "It will be remembered also that Darwin regretted not having learnt Greek." "If Darwin had any regrets on the subject of Greek, it was when he found that, in the two years intervening before leaving school and going up to Cambridge, he had almost forgotten his classics, and had to begin again an uncongenial task in order to get a degree."

INCORPORATED ASSOCIATION OF ASSISTANT MASTERS.

[The Executive Committee of the Council of the Assistant Masters' Association, in accordance with a resolution passed on December 8, 1900, adopted as a means of communication among its members "The Journal of Education"; but the "Journal" is in no other sense the organ of the Association, nor is the Association in any way responsible for the opinions expressed therein.]

LONDON BRANCH.

THE newly formed London Branch of the I.A.A.M. held its first meeting on November 26 at Mercers' School. After the Branch rules drawn up by the Provisional Committee had been modified in some particulars, the officers were appointed as follows:—Chairman, Mr. G. F. Bridge; Vice-Chairmen, Mr. A. E. Bernays and Mr. R. F. Cholmeley; Hon. Treasurer, Mr. G. H. Heath; Hon. Secs., Mr. G. Fowler and Mr. L. Green. Fifteen other members were appointed on the Committee. Resolutions calling attention to the disastrous effects on education of the low salaries paid to assistant masters, and asking for a minimum salary of £150, with systematic rises, were carried, as also was one in favour of equal encouragement by the London County Council of every type of curriculum, literary as well as scientific.

"Mr. Nield's most capable 'Guide.'"—ATHENÆUM.

THIRD EDITION,

Revised and Greatly Enlarged. Pott 4to. 4s. net.

THE JOURNAL OF EDUCATION.

A MONTHLY RECORD AND REVIEW.

SCALE FOR ADVERTISEMENTS.

PUBLISHERS' ANNOUNCEMENTS—

Whole Page ...	£5 10 0	Half Page ...	£3 0 0
Quarter Page ...	1 15 0	One-Eighth Page ...	0 17 6
Per Inch in Column, 8/-.			

PREPAID RATES FOR SCHOOL ANNOUNCEMENTS—

- Scholarships, Official Notices, School Transfers, Partnerships, &c.—6d. per line; minimum charge, 5s.
- Posts Wanted or Vacant.—30 words for 2s.; each 10 words after, 6d.
- Lectures, Classes, Non-Resident Posts, &c.—48 words for 3s.; each 8 words after, 6d.

An extra fee of ONE SHILLING is charged on advertisements with OFFICE ADDRESS.

Date of publication of next issue will be found at top left-hand corner of front page. [Advertisers are reminded that "Letters addressed to INITIALS or to FICTITIOUS NAMES, or to a CHRISTIAN NAME without a SURNAME," at Post Offices are not taken in, but are sent at once to the Returned Letter Office.]

All Letters respecting Advertisements and Subscriptions should be addressed—"THE PUBLISHER," JOURNAL OF EDUCATION OFFICE, 3 BROADWAY, LUDGATE HILL, E.C. Money and Postal Orders, on the Post Office, Ludgate Circus, E.C., should be made payable to WILLIAM RICE; Orders and Cheques may be crossed, "The London City and Midland Bank, Ludgate Branch." Postage stamps can only be received at the rate of thirteen to the shilling.

If a receipt is required for an advertisement under 10s., a postcard or a stamped envelope must be enclosed.

Notice must be given of all remittances through the Post Office from abroad, stating full name and address of the sender; and all Foreign Money Orders must be crossed for payment through a Bank.

LONDON: WILLIAM RICE, 3 BROADWAY, LUDGATE HILL, E.C.

EDUCATION IN 1904.

By "AN OLD FOGEY."

YOU have requested me, once again, to give expression to my views on education, and you say: "There are plenty of topics." I consider it a privilege to comply with your invitation, and I admit that the topics are numerous. I must, however, confine my observations to a brief consideration of some of the tendencies to which my attention has been directed during the year. The determination of all and sundry to associate, to assemble in conference, and to discuss old truths and new errors appears to have been aggravated by recent events. If talking could compass it, our educational salvation would be assured, but our projectors begin and end in the same place. The practical energies of the administrator and the schoolmaster tend towards "evaporization in a cloud of words." We need the professional services of the celebrated physician to administer those "lenitives," "restringents," and other nostrums prepared for certain legislators troubled with "redundant, ebullient, and other peccant humours." Might we not thus "beget unanimity, shorten debate, open a few mouths which are now closed, and close many more which are now open; curb the turbulency of the young, and correct the positiveness of the old, rouse the stupid, and damp the pert?"

WITHOUT the *Times* newspaper, your well informed *Journal*, and the reports occasionally placed before me by the Vicar, I should not be aware of the tendency to extend the indiscriminate and prodigal efforts which marked the attempt to relieve the "educational destitution" in 1870; of the tendency to doubt whether Mr. Balfour and the Bishops quite realized the exceedingly "slippery slope" provided for voluntary schools by the Education Act of 1902; of the suggestion that a passive resister means an unintelligent, but otherwise harmless, individual who resists the dictates of common sense and is passive in the hands of those to whom notoriety is bread and butter; of the prevailing tendency to establish an educational Vatican at Whitehall and to invest a permanent official with Papal supremacy.

WHEN, in such intervals of leisure as the duties of a foster-parent permit, I look over the bleak moorland, stretching from the window where I sit, my mind wanders to the days of a past generation—the days of deliberation and simplicity. I think of the times of tolerant Toryism and of contented servitude, when—if you will allow me to say so—Jack was not so much better than his master. The world of our ordering is too complex; we have too many counsellors, too many officials, and too many faddists—all determined to decorate with fancy designs the plain facade of our social fabric. When I was young we accepted the condition of affairs as we found it. We enjoyed the privileges and recognized the limitations of that position in life to which it had pleased God to call us. We did not endeavour to thwart Nature by artificial interventions; nor did we make it our business to embarrass the strong by excessive and costly solicitude for the unfit. And we got along very well without the vexatious activity of innumerable councils, which, a friend of mine says, appear to be organized for the special purpose of picking the pockets of ratepayers to gratify the whims of Government officials.

THE children of the poor, in the days gone by, were taught to love God and honour their parents, to obey their elders and to respect their superiors. They were also taught to work. And they were accustomed to associate physical discomfort with a neglect of any one of the Ten Commandments. The village schoolmaster, let me admit, was not the product of a Training College, certified by a Government Department, and approved by a National Union. He was not of these. But he was frequently a man of character and of commendable parts, feared by the children, and respected by the parents. If not capable of keeping babies "profitably employed" or of helping children to make messes with paint under the euphemism of brush drawing, he taught them to read intelligently, to write decently, and to do as much arithmetic as was good for them. The few promising boys were singled out for special attention and invariably got their chance. The wholesome simplicity of the moral and intellectual fare available for those prepared to pay for it was sufficient for practical purposes. But the days of "levelling sentiments" have changed all this. We are asked to assume that every vulgar little boy is potentially a Lord Chancellor. We take the "babe and suckling" from its natural guardian and at the public expense teach it how to blow bubbles or ride a rocking horse. And by mysterious and indefinite processes every child, however abysmal its mental condition may be, is supposed to be capable of assuming the Attitude of a Discoverer.

DWELLING within the unambitious confines of a rural parish, I constantly ask myself this question: Here is a school which we compel children to attend. The large majority of these children must, of necessity, follow their fathers as "hewers of wood and drawers of water." What are we trying to do with them? If I inquire whether it is the intention of the school to arrest the natural operation of social and economic forces, and to prevent these children from becoming "hewers and drawers," I am told that it is not so. The school, it is said, is intended to produce good men and women, more intelligent workers, more capable citizens of a democratic country. If this is the case, I venture to repeat the words of Baldwin Francis Duppa, Esq., who early in the last century wrote a sensible little book, entitled "The Education of the Peasantry in England." He urged our legislators not to forget that instruction is but a part of education; that "our village schools as now constituted may be not merely negative as to good, but positive as to evil; and let them reflect," he said, "that, as bodily labour is to form the principal occupation of peasants throughout life, the habit should be early acquired. Men's actions are according as they have been accustomed; therefore, let them early learn to labour."

IF this be true for the peasantry, it is more or less equally true for the working classes of industrial communities. There is a good deal of vague sentimentalism in English life, says a recent observer, which finds a ready outlet in discussing the question of child labour. A reasonable amount of out-of-school labour is not ungenial to the child, and counteracts some bad influences of his school training. But those in authority are not content to recognize the simple facts of the situation, or

to devise simple measures to meet them. The consequence is indefinite educational ideals, superficial and unsatisfactory work, and rapidly increasing financial burdens, Imperial and local. The Parliamentary vote for the maintenance of elementary education has increased from £4,000,000 in 1891 to nearly £10,000,000 in 1902; the local contributions by rates and subscriptions during the same period from about £2,000,000 to over £4,000,000; the average cost of the instruction of each child from £2. 1s. 5d. to £2. 13s. 2d. (In Germany the cost is about 30s. in the country districts and 50s. in the towns.) And the average rate for the relief of the poor has in the same time gone up over 20 per cent.

I REFER to the Poor Rate because in 1870 Mr. Forster predicted that an Education Rate would save the Prison Rate and the Pauper Rate. "But should it," he said, "exceed 3d. in the £—and I do not believe it will amount to anything like that sum in the vast majority of cases—then there is a clause in the Bill which stipulates for a very considerable extra grant out of Parliamentary votes." Under the Education Act, 1902, the rates for the maintenance of primary schools in the rural counties are already seldom below 6d. in the £; in Berkshire and Buckinghamshire the rate is 9d.; in Durham and the West Riding of Yorkshire, 10d. This is the beginning, and we know that the School Board Rate for London, notwithstanding the increasing rateable value, advanced from 6d. to 1s. in less than twenty years. Concurrently with the growing expenditure on education, it is to be remembered that the general burden of the local ratepayer is always tending to increase. In 1874–5 the amount expended out of rates in England and Wales was under £20,000,000; in 1899–1900 it was over £40,000,000; it advanced from 16s. per head of the population to 25s.

IF you inquire how it is that the annual cost of a pauper has increased from about £11 in 1890 to £16 in 1902, the zealous Guardian of the Poor will tell you that it is due to the regulations of the Local Government Board; and, if you want to know why the cost of public elementary education has increased by leaps and bounds, you must refer to the Codes of the Board of Education. The tendency of the Code of 1904, if I interpret it correctly, means either nothing or a largely augmented expenditure on our primary schools. To give effect to the admirable sentiments admirably expressed in the admirable introduction would, I am informed, double the cost of teaching in the schools, which means nearly to double the cost of maintaining them. It is a habit favoured among permanent officials to call the tune and expect the ratepayer to pay the piper. We have to inquire, it seems to me, whether the great and rapidly growing cost of primary education, when compared with the past, has brought with it any corresponding benefit to the community. Year by year each new Code modifies "this" or requires "that," doubtless with the intention of increasing efficiency and with the certain effect of increasing expenditure. In Parliament an official apologist has been known to admit the failure of the system and to display becoming humility. Like a certain architect and land surveyor of noble sentiments and speech, "he was a most exemplary man, fuller of virtuous precept than a copy book; some people likened him to a direction post, which is always telling the way to a place, but never goes there." The Code proposes, but the particular condition of a school disposes, and, in pursuit of a shadowy educational ideal, the substantial results of simple thoroughness in mental discipline and the moral value of hard work are lost. The experience of the indignant employer of an errand boy is not singular. The boy in question had passed the seventh standard, and, on being tested, failed in a sum of long division, while his writing was very bad. But he had been taught chemistry, mechanics, physiology, and water colour painting.

"ONE of the great advantages," said Mr. Balfour, when he introduced the Act of 1902, "which I foresee from the Local Government point of view, is that public education will now be thoroughly decentralized, and it will be for each Authority to determine what is the species of education most needed by the children in its area to fit them for their work." And again: "The interference from Whitehall will not henceforth be with individual schools; it will be with the County Council. It is the County Council which will receive the Imperial

subvention; it is to the County Council that all complaints will have to be made; it is by the County Council they will have to be remedied." The Board of Education, I am informed, displays no inclination to give effect to the undertaking of the Prime Minister or the intentions of Parliament. The Board, like the Poor Man's Friend and Father, would say of the Local Authorities: "They needn't trouble themselves to think about anything. I will think for them; I know what is good for them; I am their perpetual parent. Such is the disposition of an all-wise Providence." For how long the important Local Authorities, influential in both Houses of Parliament, will submit patiently to the paternal pretensions of the Board; how long they will agree to rate themselves for the satisfaction of regulations over which they have no control, remains to be seen.

PERMIT me, however, to point out that I do not undervalue the functions of Central Authorities in so far as their control makes for economy of effort or of money. Public expenditure should be audited, and "journeying expenses" where no journey is taken, presentation portraits, suitable demonstrations on the chairman's wedding-day, and memorial keys, duly disallowed. But I have yet to learn of any public service in which economy has been effected by the interference of a Government Department with the independent action of a Local Authority. On the contrary, even the remarkable regulations to be observed by Local Authorities in obtaining sanction for loans for public works do not appear to have had any result other than that of wasting time and increasing the cost of administration. In 1891, for instance, the Local Outstanding Loan Account stood at about £200,000,000; in 1899-1900 it was nearly £294,000,000—an amount equal to approximately half the total sum of the National Debt.

THE Education Act of 1902, Mr. Balfour predicted, would give to the educational evils of this country the complete radical and final cure. It would end barren controversies and terminate a system of costly confusion. From what the Vicar tells me of the meetings of the Education Committee, for which he continues to neglect his pastoral duties, I am not indisposed to believe that the Act, if administered with moderation, will have beneficial results. Something appears to depend upon the meaning to be assigned to the expression "Local Education Authority." It is responsible for maintaining and keeping efficient elementary schools and of determining the kind of secular instruction to be provided. It is its duty to supply, or aid the supply, of education other than elementary, and to promote the general co-ordination of all forms of education. Such responsibilities, if real, are of far-reaching consequence; and, subject to the provisions of the Act, it might be assumed that the different localities in England and Wales will develop educational institutions appropriate to local circumstances and responsive to local needs.

THE Secretary of the Board of Education, at a recent conference, apologizing for the Department he so ably serves, suggested that it was in the position of a piano-player hired by Californian miners, who could not say what music they wanted, although they knew what they didn't want. And the pianist exhibited the following notice: "Please don't shoot the performer; he's doing his best." It is an entertaining and alluring picture. But we are a country of self-governing communities, and it should not be surprising if local Californians manifest some reluctance to dance to every tune that the Government musician may find it convenient to play. They will probably make it their business to learn to play the piano on their own account and to employ the Government to keep he instrument in tune.

WHILE problems connected with the education of the many for whom social and industrial conditions limit the duration of school life are engaging attention the question of providing for the few better facilities according to their circumstances and mental capabilities is not neglected. Mr. M. E. Sadler, whose volume on "Secondary Education in Liverpool" I have read, is discharging the duties of the congenial office of guide and philosopher to perplexed municipalities with singular ability and discretion. Mr. Sadler appears to combine the idealism of the enthusiast with the practical insight of the man of affairs.

And he has a just appreciation of the limits and possibilities of educational processes. The "passive resister" is stimulated by imagining himself a Pilgrim Father, and the promoters of the crusade against imaginary disabilities find satisfaction in posing as the leaders of another Great Rebellion. But Mr. Sadler might have been spared the embarrassment of providing an historic parallel. In the sedate pages of a monthly record of educational progress I find a contribution entitled "Mr. Sadler and Richard Mulcaster." It is not surely a very remarkable coincidence if a discerning educationist in the sixteenth century and an impartial investigator in the twentieth century should have both realized that in education, as in diet, it is quality and not quantity which matters. The ladder invites the steps of all, but only the few have strength to climb it.

REVIEWS AND MINOR NOTICES.

Gaspard de Coligny. By A. W. WHITEHEAD, M.A. With Illustrations and Plans. (Methuen.)

Gaspard de Coligny is a fine subject for an historical biography; for the admiral was one of the greatest statesmen of the Protestant movement, his personal character was worthy of the place he held in it, and his career coincides with a distinct epoch in the religious struggle in France and presents several debatable questions which demand the exercise of industry and ingenuity. Mr. Whitehead's book exhibits the results of a careful study of the history of the period; it is based on primary authorities, both in print and in manuscript, and it takes count of all the more important of the many modern works bearing on his subject. He has gained new materials from manuscript sources in Paris, Rome, and various Italian cities, as well as in London, and has probably made a more exhaustive study of Coligny's life than any of his predecessors. As a youth, Coligny had good reason to look forward to a brilliant career; for he was a nephew of Anne de Montmorency, the Constable. This relationship exercised a strong influence on his future; he was virtually a member of his uncle's family, and from the death of Francis I. there was enmity between the rival houses of Montmorency and Guise. As young men, Coligny and Francis of Lorraine, afterwards Duke of Guise, were intimate friends; they dressed alike, and engaged in the same sports. The ill-will between them began in 1548, gradually increased, and in 1553 broke out in fierce recriminations after the victory over the Imperialists at Renty. The Constable, who was then in the ascendant, was gathering all the good things on which he could lay hands for his own house, and Coligny was Captain-General of the Infantry, Admiral of France, and Governor of Picardy.

The war with Spain ended in the humiliation of the Constable and the triumph of the house of Guise. The Constable was defeated at St. Quentin, and, though Coligny did good service to France by his vigorous defence of the town, he was forced to surrender, and became a prisoner of war. Guise came back from his unfortunate campaign in Italy, and he and his friend Strozzi regained Calais for France. While Coligny was in captivity he was converted to the religion of Calvin. The change was not altogether sudden. Mr. Whitehead throws doubt on the alleged Protestant sympathies of his mother, Louise of Montmorency, which, he suggests, scarcely went further than "the sentiments of many courtly readers of the psalms of Marot"; he traces the early symptoms of the admiral's conversion, and shows that it was beyond question religious, sincere, and non-political. His opinion that Coligny was probably not concerned in the conspiracy of Amboise is founded on an examination of such evidence as exists, and will be generally accepted, but we note with surprise his theory that the *chef muet* (is not *capitaine* the word used by La Renaudie?) was "a pure figment of the brain of La Renaudie." Coligny openly assumed the position of a Huguenot leader at the Assembly at Fontainebleau by presenting petitions for toleration and for the use of buildings for Protestant worship. From that time nothing was so dear to him as the interests of the cause of the reformed religion: it was, we read, "the passion of his life." His conduct was uniformly disinterested, and was inspired by one lofty aim. Yet in some respects he did not

se above his time. When war began he made savage reprisals on the Catholics, scarcely to be justified by the necessity of forcing the enemy to respect the lives of Huguenot ministers, and he actually suggested that Paris should be delivered over to be sacked by the German mercenaries engaged by his brother Andelot—a proposal condemned here in terms of just severity. Mr. Whitehead argues at some length that Coligny was innocent of the murder of Guise, but points out that he cannot be absolved from all responsibility for it: he knew of Poltrot's intended crime, and did nothing to prevent it, and when he heard that it was committed he openly rejoiced.

"Unlike the other great generals of the sixteenth century," Coligny, we are told, was not attracted by war for its own sake. That he was unwilling that his party should have recourse to arms is certainly true; it is, perhaps, doubtful whether he should be ranked as a general with men like Strozzi, Guise, Mouluc, and Tavannes—at least, so far as conduct in the field is concerned. He made "grave mistakes" in the first war of religion. The disaster at Jarnac was largely due to his slackness and lack of skill; and Mr. Whitehead acknowledges that he cannot satisfactorily rebut the Duc d'Aumale's remark that Coligny was too hasty in calling Condé to his aid, and that he brought destruction on the whole army and its commander in order to save himself from a partial check ("Les Princes de Condé," Vol. II., 74). His overbearing temper led him to commit mistakes from which he would have been saved if he had been more willing to accept the plans of others. Yet he had some of the highest qualities of a general, and showed them conspicuously after Condé's death left him the virtual command of the army. He was undaunted and resourceful in misfortune. After what seemed to be a crushing defeat at Moncontour, his extraordinary energy placed his party in a better position than they held during the whole previous course of the war; for, by the Peace of St. Germain, French Protestantism gained "a really separate political existence." The account of the events which led to the Massacre of St. Bartholomew's Day is well considered. Coligny persuaded Charles IX. to adopt his anti-Spanish policy, and Catherine was at first not unwilling that her son should resent the haughty dictation of Philip II. and Alva. The defeat of Genlis threw her definitely on the side of the opposition. She was convinced of the risks which Coligny's policy involved, and she saw that she was losing her power. Coligny's ascendancy over the King seemed complete. She determined to put an end to it by assassination, and her failure drove her to have recourse to a general massacre. For, as Mr. Whitehead shows us, the massacre was not premeditated, was not prompted by Spain or Rome, and was not, as Kervyn de Lettenhove maintained, the answer to a Huguenot plot. An appendix is devoted to an elaborate argument to prove that the article in the Hampton Court treaty, of September 20, 1562, providing that the English were to retain possession of Havre until Calais was returned to them, was not authorized by Condé and Coligny; that they did not know of it, and that it was accepted by the Vidame de Chartres on his own responsibility. This contention is based on manuscripts in the Record Office, and the point, which is of considerable interest, seems fairly established. It does not, of course, affect the fact that the Huguenot leaders admitted an English garrison into Havre.

It is a pity that such valuable matter as that which Mr. Whitehead has given us here is not presented in a more literary and attractive form. The duty of an historian is only half fulfilled by research. This is too frequently forgotten by the younger English historians of the present day: it is, we need scarcely say, not forgotten in France. The chief faults which detract from our satisfaction with this book are a certain lack of force in presentation, the constant admixture of discussion with narrative, references to modern writers and their opinions in the text, and the author's habit of using the first person plural. An historian should seldom write of himself. In the rare cases in which he may do so, as when he thinks it necessary to record a personal experience, or to expound an intended arrangement of his matter, he should speak of himself in the first person singular like any other individual, who is neither a king, a bishop, nor an editor. Unlike the writer of an unsigned article, which is subject to editorial approval, he should only use "we" when he speaks of his reader as well as himself. There is nothing to be said against such an expression as "we have already seen," but "we think" and "in our judgment" are inadmissible in a history.

The Principles of Education. By T. RAYMONT.
(Price 4s. 6d. Longmans.)

Prof. Raymont has been first a teacher himself and then a lecturer on teaching, and what distinguishes his volume from the treatises with which we naturally compare it—Spencer, Bain, Fitch, Sully—is the happy combination of theory and practice. "The great majority of English books on the subject are either frankly empirical or frankly psychological." Prof. Raymont's great merit is the clear recognition that education is indeed a science, but an applied science, and that psychology is only one of the mother sciences on which it is founded.

The author's primary object is to stimulate young teachers to serious thought about the work they have undertaken, and a more exact title would have been "The Middle Axioms of Education." There is little of formal philosophy or arguing first principles, and there is no attempt to provide the teacher with a manual of his art; but he is led to consider his general aims and methods, what he should seek to accomplish, within what limitations, and how he can best bring it to pass.

The reviewer of a book of such scope has two alternatives: either he may select one or two of the many topics and discuss the author's treatment, or he must content himself with a bare enumeration of the contents and a general appreciation of the style and matter. As on most of the moot points we have sufficiently declared our own views, we choose the simpler and less ambitious course. Part I. treats briefly of the meaning of education and of the relation of theory to practice—the latter chapter being, in substance, the reproduction of an article contributed to this *Journal*. Part II. discusses the relations of the State to education, and points the *via media* between Plato's "Republic" and Herbert Spencer. Part III. is an independent essay on "The Study of Children." Part IV., on teaching and training, forms the bulk of the book, and consists of chapters on the choice of subjects, on the scope of school studies, on the order of subjects and sequence of lessons, on the correlation of studies, on the process and devices of teaching, on the influence of examinations, on the personality of the teacher. The above enumeration fails to indicate that most burning questions of the day—the relation of the Central to the Local Authority, co-education, day schools and boarding schools, the place of classics in modern education, the teaching of dogma, corporal punishment—are directly or incidentally touched upon.

What has most impressed us is the author's reasonableness and common sense. He has read widely; he can see both sides of a case, and he never dogmatizes. Most valuable is his exposition of the exploded "faculty" psychology, which, consciously or unconsciously, has regulated our existing codes and curricula. Thus, only the other day it was argued that the disciplinary value of Greek was unique, that for the cultivation of the imagination there was nothing comparable with Greek poetry, and that for developing the power of expression there was nothing that could take the place of Greek and Latin composition. Prof. Raymont offers, indeed, no opinion on the question of compulsory Greek, but he rules such arguments out of court. One study is to be preferred to another, not because of the faculties it trains, but because of the interests it evokes.

Jerusalem under the High Priests. Five Lectures on the period between Nehemiah and the New Testament. By EDWYN BEVAN. (Price 7s. 6d. Edward Arnold.)

The audiences who listened to these lectures are to be congratulated. They are far and away the best popular presentation of the period connecting the Old and New Testaments that exists in English. But they are something more than a popular summarization of accepted results. The author aims at setting forth and explaining the inner significance and underlying tendencies that determined the course of events. He makes clear—often in an independent, and always in a vivid and interesting, way—what the forces were that swayed national life and the great movements of the time.

The five lectures fall under the following heads:—(1) The End of the Persian Period and the Macedonian Conquest; (2) Hellenism and Hebrew Wisdom; (3) Judas Maccabaeus and his Brethren; (4) The Hasmonaean Ascendancy; (5) The Fall of the Hasmonaean and the Days of Herod. Perhaps the best thing in the book is the second lecture. Here the author gives a masterly analysis of Greek civilization and culture as they affected the East, and also of the fundamentally opposed

currents of Hebrew thought and feeling. The effect of Hellenic influence upon an Oriental city is thus described :

What did the conversion of a city to the Hellenic type imply? In some cases, no doubt, the entrance of a new element, Greek or Macedonian by blood, into the citizen body. Samaria, for instance, was re-peopled by Alexander with Macedonians. In all cases the forms of public life must have been more or less modified after the Greek pattern; we should have found the citizen body electing its magistrates annually, and a definite number of the principal men sitting as a senate which resembled the *bule* or *gerusia* in a Greek State. We should have seen the decrees of senate and people registered upon tables of bronze or stone.

The writer goes on to remark :

More momentous still were the innovations in the social and everyday life of the people. What is it that gives to the lives of men their distinctive character and content? It is what we call their interests—the determination of their thoughts and feelings upon certain objects or pursuits. Change these and the whole life acquires another complexion. Well, it is just in this that we see the chief operation of Hellenism: suddenly into the old limited life of the Syrian peoples new springs of interest are introduced; the pulses of men seem to beat quicker under new stimuli; new ideals awaken new passions; satisfaction is sought and found in directions hitherto untried (page 34).

He then proceeds to enumerate and describe these new elements—the gymnasium and its guilds (especially the *epheboi*), the theatre, *stadium*, and hippodrome, and the study of Greek science and philosophy. The writer in this connexion protests against the often-made assertion that “the East never changes.” It would be a great mistake to imagine “the Damascus of St. Paul’s time like the Damascus of to-day. In St. Paul’s time we should have found ourselves in a Greek city” (page 39).

Mr. Bevan’s estimates of Judas Maccabaeus (pages 97 ff.) and of Herod are interesting and unhackneyed. He has succeeded in giving, in lucid outline, a sketch of the march of events in a very complicated period, and has illuminated his narrative with brilliant pieces of criticism and insight which lend it unfailing interest. The scholarship is sound and thorough, and there is not a dull page in the book.

Great Englishmen of the Sixteenth Century. By SIDNEY LEE. (Price 7s. 6d. net. Constable.)

This volume is founded on lectures delivered at the Lowell Institute, Boston, but the lectures have undergone “sweeping alterations in form and detail.” Mr. Lee is not a preacher who palms off on the public a set of popular lectures as if they were original contributions to literature. He knows that readers and hearers demand different treatment.

The six great Englishmen are Thomas More, Philip Sidney, Walter Raleigh, Spenser, Bacon, and Shakespeare. To them is prefixed an introductory chapter on “The Spirit of the Sixteenth Century.” To interest the cultivated reader of general intelligence rather than the expert is the aim of the essayist, as it was of the lecturer, and he has admirably succeeded in putting in an attractive form his studies and original researches which are set forth for scholars with “no flowers by request” in the pages of the “Dictionary of National Biography.”

Particularly noteworthy for its sanity of judgment is the last chapter, “Foreign Influence on Shakespeare.” The weakest chapter in the volume is that on Bacon, and, though it may seem ungenerous to pick out the weaknesses when so much is strong, we are bound to justify our censure.

In the lecture on Bacon Mr. Lee breaks what to him is new ground: “I have not written on Bacon at any length before.” There is, however, little new in his treatment, and he gives us, stripped of its tinsel and trappings, Macaulay’s Essay. According to Mr. Lee, Bacon combines all the worst side of his mother’s rigid Calvinism, the belief that he was a predestined vessel of grace, and of his father’s statecraft, the opportunism of Machiavellian diplomat. This seems to us a very crude and imperfect diagnosis of Bacon’s complex character. It takes no account of the age in which he lived, when political morality was at its lowest ebb. It does not bring out what we take it is the clue to the labyrinth, that, though Bacon was self-deceived, he was no conscious hypocrite; that apart from his splendid genius, to which justice is done, he had a true enthusiasm for humanity; that to him the pursuit of wealth and honour was really a means, not an end; that his recklessness in money matters was that of a Harold Skimpole, not of a Jabez Balfour.

Speaking to an American audience, Mr. Lee was anxious to

dispel the hallucination that confounds Bacon and Shakespeare, and he discusses in a valuable note the authorship of the two poems with which Bacon is credited. We wish he had also treated the singular verbal parallelisms set forth by Dr. Theobald and other “cranks,” of which no sufficient explanation has been offered.

In a popular lecture we do not look for any profound exposition of Bacon’s philosophy or politics, but we might reasonably have expected a more appreciative account of Baconic induction and some reference to Bacon’s theory of government, as well as his practice, and we could have well spared the explanation of the “Idols” and the *præcis* of the “New Atlantis.”

The bibliography is meagre. None but English works are given, and among these surely Dr. Fowler’s edition of the “Organum” and Dean Church’s monograph deserve mention.

There are six admirably reproduced illustrations. That of Sir Philip Sidney from the Oliver miniature at Windsor Castle is new to us.

The Philosophy of Education. By HERMAN HARRELL HORNE, Ph.D. (Pp. xvii, 295; price 7s. 6d. net. Macmillan.)

Dr. Horne is Assistant Professor of Philosophy and Pedagogy in Dartmouth College, and his book is a message of peace—of peace through unity. It is an attempt to organize contemporary conflicting claims in a system of mutual dependence, giving value where value belongs. He says in his preface: “I cannot hope to have presented a satisfactory organization of these opposing tendencies, but only to have suggested where the contemporary educational problem lies, and, perhaps, some of the elements of its solution.” But he has done more than this and has given us much to think about. The book itself has existed for some years in the form of manuscript lectures successfully delivered to various summer gatherings of teachers, and is now recast and extended. It is not a manual of practice, but an interpretation: it aims at giving not rules, but insight. After an introductory chapter on the field of education and the various points of view of its study—the history, the science, the practice, and the philosophy of education—he proceeds to consider the subject under its different aspects. He deals with the biological view of education, the physiological, the sociological, and the psychological view, and then unites all in the last chapter under the philosophical view. The discussion of the biological aspect leads to the definition of education as “the superior adjustment of a conscious human being to his environment.” This becomes, under the physiological view, “a physically developed human being”; under the sociological it is the environment that needs explanation, and is defined as “intellectual, emotional, and volitional”; while under the psychological the development is still further defined as being both “physical and mental.” Lastly, under the philosophical aspect of education, the final definition of education is given as “the eternal process of superior adjustment of the physically and mentally developed, free, conscious human being to God as manifested in the intellectual, emotional, and volitional environment of man.” This is merely given as an example of the course of the discussion; every view modifies, in a measure, what those who hold the view think should be done for the being whose education is in question. But the book contains far more than this. It is a bright, conciliatory, and closely argued exposition of its author’s views. It gives enough theory to illumine practice, and enough practice to give weight to theory, and abounds with well chosen quotations from the works of present and past authorities. Every section is followed by a list of books of reference, and at the end an index is given. It is a well written and well furnished book, and teachers will do well to note it.

From the Monarchy to the Republic in France, 1788–1792. By SOPHIA H. MACLEHOSE, Author of “The Last Days of the French Monarchy.” (Glasgow. Maclehose & Sons.)

The author of this little volume has achieved a signal success. Her account of the struggles and changes through which France passed from the convocation of the States-General to the abolition of Royalty is as good a piece of historical work as any which has lately been published in Great Britain. It is founded on a wide acquaintance with the best authorities, both contemporary and secondary; is thoughtful, well put together, and agreeably written. Sufficient references are given in foot-

notes, and the excellent "List of Authorities" will be found far more useful than some longer and more pretentious bibliographies. The questions who were to elect representatives to attend the States-General, how the representatives should deliberate, and how votes were to be reckoned were not easy of solution; for there were no settled precedents. Brienne invited discussion, and his appeal to the public, as is observed here, "gave absolute monarchy away." We have a curious picture of the humiliations imposed on the representatives of the Third Estate at the opening of the session, which was to see its triumph over the two privileged orders, and its virtual defeat of the crown. It was widely expected that the King would side with the Third Estate, and its representatives believed that in revolting against privilege they would be acting in accordance with his wishes. Inclined to liberalism as Louis was, he had not the intellectual ability to see that his true policy was to put himself at the head of his people. He drew back when he should have gone forward: the crown identified itself with the cause of privilege and shared its defeat. He was forced to request the estates to unite.

After the adjournment of the National Assembly the control of events passed to Paris, to the legally constituted assembly of electors and to the agitators of the Palais Royal. Louis had fifty-five thousand troops in the immediate neighbourhood: he refused to withdraw them, and yet abstained from putting his fortune to the touch by employing them to crush the party of opposition. It was not long before they fraternized with the mob. The institution of the Commune of Paris and the National Guard rendered the capital independent, and provided it with a force which compelled the King to obey its demands. How these changes were effected is told clearly and in an interesting manner. So, too, the position of Mirabeau and his relations with the court form the subject of an admirable chapter. Only on one point must we express dissent. We read here that the "men of 1792" exhibited "genuine patriotism," "dauntless courage," and "unflinching determination" in defence of their country. This, we maintain, is far from true. The bloodthirsty and ruffianly *fédérés* who, after a few weeks' drilling in the camp at Soissons, were sent to join the army were even worse soldiers than the ordinary volunteers, and the new volunteer levies of 1792 were distinctly inferior to those of 1791. Valmy and Jemappes were won by the regular troops and the earlier volunteers. The "men of 1792" were an undisciplined lot; many of them were hired substitutes, the very refuse of the streets; their camp was a scene of unbridled licentiousness; they pillaged the country-folk, and were worse than useless in the face of the enemy. The revolutionary army, it is true, became a fine fighting machine; but the changes which made it so did not begin until the late summer of 1793, and were not completed until the amalgamation of the regulars and the volunteers was carried out early in 1794.

Education through the Imagination. By MARGARET MCMILLAN. (7½ × 5 in., pp. xv, 196; price 3s. 6d. Swan Sonnenschein.)

An excellent plea admirably urged. Miss McMillan—whose name is well known among Froebeliens—has touched upon one of the many weak spots in our public education, and especially in that of our young children—the neglect of imagination. Having stated and expounded her problem, she turns to consider the child in its various activities, and shows only too clearly how the need for fuller opportunities of expression—which are not, or only faultily, supplied—hampers and cramps the child; how eagerly it uses what is given it and asks for more. The child as artist, the child as artisan are two of the topics which she makes it quite clear to any one who thinks of a child at all, what its demands are, what it misses, and the bad results ensuing therefrom. Had she in the former case—the child as artist—included the neglect of sound imaginative literature, and shown the value of closely connecting drawing with its study—the translation of word-speech into picture-speech, however clumsy the picture may be—she would only have increased the weight of her plea. Many valuable hints, too, are given in the chapters dealing with imagination in the commercial school, in the science room, and in moral training. In the first chapters of the book the subject is treated from a more abstract and general point of view; and amongst these we would call particular attention to the chapter on "Imagination and Movement," which contains much which we have not

noticed before as being urged in this connexion. In fact, Miss Macmillan covers the ground excellently, and proves up to the hilt the need for education through imagination and for more imagination in dealing with children. All teachers will do well to get her book and to read it with care. Those who have become teachers already and those who are only intending to become such will alike find much to help them in its pages.

"English Men of Letters."—*Hobbes.* By Sir LESLIE STEPHEN. (7¼ × 5 in., pp. 243; price 2s. net. Macmillan.)

During the last months of his life Sir Leslie Stephen was writing this book. Then he gave it to Mr. F. W. Maitland to see it through the press for him, submitting at the same time some notes about the influence of Hobbes on his successors. These Mr. Maitland eventually refused to make use of, inasmuch as the book seemed to him complete without them. He was right in so doing. The book as it stands is as complete an account of the author of "The Leviathan" as the world will care to possess. It gives, with the accustomed skill in selection and arrangement for which Sir Leslie Stephen was noted, all that is known of the life of Hobbes, and then turns to consider his doctrine under the headings of "The World," "Man," and "The State"—drawing his material mainly from the "De Corpore," the early part of "The Leviathan" and "Human Nature," and the "De Corpore Politico," the "De Cive," and "The Leviathan" severally under the three heads, and adding quotations from his other works. The task is admirably performed, and we are given a very clear view of the most conspicuous English thinker between the days of Bacon and those of Locke. But, even with all his skill, Sir Leslie hardly succeeds in making "the timid old gentleman," who died at the age of ninety-one, live again; or his doctrines—except those which concern the State—interesting to any but a professed historian. The term "atheist," so frequently applied to Hobbes, seems to have been used to express a general dislike to the views he set forth rather than as a direct accusation of disbelief in the existence of a God, which he believes may be deduced from the consideration of creation. But practically it comes to the same thing, for in his description of the World he leaves Him no space in which to work. We did not mean, however, to enter on any points of controversy. We are given a sound and adequate account of the philosopher and his opinions in the book before us, and with that we must be content.

Lucian, Vera Historia. Edited, with Introduction and Notes, by R. E. YATES. (Price 1s. 6d. Bell & Son.)

It is now five-and-twenty years since Mr. C. S. Jerram issued the "Vera Historia" in an edition "which," to quote the new editor, "interesting as it is, is not very well adapted to modern requirements." Not ours be it to compare the earlier with the later book; but Mr. Yates's words suggest an inquiry whether he has made himself familiar with what has been done for his author in the interim. We are not convinced that he has. Thus in I. 14, had he been aware of Sommerbrodt's punctuation—*ὑποτάξας ἐταχθῆσαν δὲ οὐτως ἀράχνας κ.τ.λ.*—he might have felt it to be inevitable; unless we are to suppose that something has fallen out by which the ἀράχναι were introduced, and mark a *lacuna*. In II. 11 he gives no sign of knowing that ἀρβὰι has been challenged. As to improvements made on Mr. Jerram, one may be noticed. In I. 14 occurs the Thucydidean *ὡς ἑκαστοί* (= *generatim*; cf. Thucydides I. 48, 4). "Each in his order" said the former; "each in their order" says the present editor. Is not this to keep the error and spoil the English? Again, in matters of scholarship Mr. Yates seems not infallible. We should like him to show us a passage in which *περιεργία* means "curiosity" in the ordinary English sense; Sommerbrodt, at least, could not get any such—or any fit—meaning out of it in I. 4, and ventured on *παρρηγορία*. Nor has the utmost care been exercised in small matters: for example, the text gives *Κρησιόχου*, whereas the vocabulary has *Κρησιλοχος*. Lastly, we are not of the opinion that the doctrine of the conditional sentence in Greek can be profitably discussed in a dozen lines of annotation. From these grumbles we go on to say that Mr. Yates's book, not faultless, is quite usable. It has section headings and many pictures, being intended for young boys. The help supplied in it is justly measured. Some slight and necessary expurgation has been made; which done, we have left a story of unusual attractiveness, as fascinating as any audacities of a Münchhausen. We hope for pardon if we offer a suggestion as to how it may be used. Let the teacher read a paragraph from Wynne Willson's "Wonderland"; then let him set his boys to pick out the sense of the corresponding part of Lucian from vocabulary and notes. Twice they should construe it, the second time more freely. Three or four points of grammar should afterwards be treated with the greatest possible

thoroughness. For the next lesson the boys may bring up, in as good English as they can produce, their own written version of the text already studied. The true teacher will endeavour, even with quite young pupils, above all to suck the marrow from his author. But we grow didactic instead of critical. Let us end by recommending fourth-form masters to try a term with Mr. Yates's book; our notice of which is not meant to be so censorious as it may seem.

Memoir of Rosamond Davenport-Hill. By ETHEL E. METCALFE. (Price 2s. 6d. net. Longmans.)

Miss Davenport-Hill was one of those "adorable spinsters" who, according to the late Lord Shaftesbury, go to the making of England, and the present "Memoir" is a brief but adequate chronicle of her public life. It shows how by her parentage and upbringing (her father was the distinguished Recorder of Birmingham, and she was her father's constant companion), she was predestined, as it were, to her philanthropic work, and it sets forth what that work was during the seventeen years that Miss Hill was a member of the London School Board. "In quietness and in confidence shall be your strength"; and while the Moderates on the Board were advocating their cheese-paring policy or trying to enforce the teaching of the Athanasian creed in Board schools Miss Hill sat still and knitted and held her own. She was as far removed from the "screaming sisterhood" as she was from the "stupid party"; witness the dignified remonstrance addressed to Miss Marie Corelli, a challenge declined by that lady fire-eater, who played the part of Bob Acres. Our only complaint against the author is that she has not given us more of Miss Hill herself, who, whenever she appears in her own person is delightful. For instance, her rejoinder to the argument that no pension need be provided for the Board's women teachers who married, because they had thereby improved their position: "That's as may be." And her story of the plea urged by a child summoned under Notice B: "Mother's got twins and a wooden leg." Like Mrs. Partington, we still trundle our mop to stem the tide of split infinitives. "Mde." is not the French abbreviation of "Madame," and Miss Emily Faithfull has two "l's" in her name.

A Short History of Rome. By J. WELLS. (Price 3s. 6d. Methuen.)

The appearance of Mr. Wells's book in a fifth edition shows the extent to which it has won public favour. To the new issue there have been added four battle plans, about a dozen paragraphs and notes, and an appendix (necessarily slight) on Augustan Literature; but the general structure remains the same. We observe that the author makes no attempt to fix the position of the Teutoburgiensis saltus—which is a prudent reserve. He is wise, too, in not touching that most difficult of questions in German ethnology, who the Suebi—now apparently a single tribe, and now an amphictyony—were. But we should have liked him to write "Suebi" instead of the late form, "Suevi." We are not minded, however, to carp at an enlightened school-book, accurate in its facts and recommending itself by spirit and substance to all who would teach not Roman names and dates, but Roman history. Boys, as well as teachers, should be grateful to Mr. Wells; for he tells them nothing that they will have to unlearn, and he addresses them in language that is easy and intelligible, without being based on the assumption that they are idiots. From fourth form to sixth form this is a text-book to use.

A History of England. By the Rev. J. FRANK BRIGHT, D.D. Period V.: *Imperial Reaction—Victoria, 1880-1901.* With Maps and Plans. (Price 4s. 6d. Longmans.)

Dr. Bright is well aware of the difficulty of his task. In a history of years just passed, "the writer wades hopelessly amid the flood of Blue-books, reports, newspaper articles, magazines, and political speeches. . . . The most that he can hope to achieve with any chance of success is to give such a consecutive and simple narrative of the facts, grouped as far as possible around certain leading lines of thought, as shall render them intelligible, and assist the memory in retaining them." The chapters deal with the various Ministries—Mr. Gladstone's Ministry, 1880-1885; that of Lord Salisbury, 1885-1886; Mr. Gladstone's, February to June, 1886; Lord Salisbury's, 1886-1892; Mr. Gladstone's, 1892-1894; Lord Rosebery's, 1894-1895; Lord Salisbury's, 1895-1901. When we consider the extreme difficulty and delicacy in tracing the movements described, we cannot but feel how extremely fairly and intelligibly Dr. Bright has dealt with his topics. We have, for instance, the Irish question, Mr. Gladstone's foreign policy, and Mr. Gladstone's policy in South Africa; and the narrative has to disclose how the disintegration of the Liberal Party was brought about. Lord Salisbury's foreign policy and Mr. Chamberlain's Colonial policy require discreet treatment, and, on the whole, they are dealt with discriminatingly and with fairness. The South African War naturally requires conspicuously careful handling, and Dr. Bright gives a lucid and fair-minded account. The only question in reading the book which seems to arise is that of proportion of space to the different events and movements described, and emphasis on certain individuals and measures. In education, we are reminded that Mr. Chamberlain desired free education, and Mr. Gladstone reserved his opinion. We see the start of technical education from the duty

on spirits, and we read of the Voluntary Schools Act and the Board of Education Act. These do not figure largely in Dr. Bright's perspective. The larger issues of later British history claim his attention. His study brings him to the subject of the consolidation of the British Empire: "Means may perhaps be found to obviate the apparent obstacles and to establish between England and its self-governing Colonies different relations to those now existing. If so, and if a united Empire, whether distinctly federative or of any other sort, comes into existence, the close of the reign of Queen Victoria will be the close of a complete page of history. In the future it will be the British Empire, and not Great Britain, which will occupy the attention of the historian. The words of necessity imply a momentous change." Whether the book can be rightly regarded as a school-book is doubtful; but it has conspicuous merit as a well told account of recent history. There is a good and valuable index.

House, Garden, and Field. By L. C. MIALI. With Illustrations by A. R. HAMMOND. (Price 6s. Edward Arnold.)

Prof. Miall, who has done perhaps more than any living teacher to promote an intelligent study of Nature both in schools and colleges, has been requested by various teachers who were not intelligent to draw up for them a series of lessons on common objects. He wisely declined on the ground that all such second-hand knowledge is dead matter, with no germinating power. The teacher is not a phonograph that can be wound up to reproduce a set tune; he must be magnetic himself if he is to magnetize his pupils. Instead of this he has given them some forty Nature studies, notes of his own jottings in his laboratory, his garden, and the country round Leeds, showing them what to observe and how to observe. There is no attempt at sequence or classification by subjects in these studies; a general knowledge paper is sandwiched between the holly-fly and honey-dew, and we jump from the human face divine to London pride. But, as the object Prof. Miall has here in view is not to methodize, but to stimulate, this discursiveness is no drawback, and the teacher of botany or zoology or physiology will have no difficulty in selecting each his own special *pabulum*. Readers of the *Journal* need hardly be told that Prof. Miall is original and independent in his judgment (he differs more than once from Darwin), and that his style has a literary flavour which is rare among scientists. It is strange that in the paper on "Old English Gardens" there is no reference to Bacon's essay. We venture to differ from his dictum that natural history clubs should admit no written papers or printed proceedings. Worthless as these may be in themselves, they were, in our experience, the very life of school clubs.

Stories of the Ancient Greeks. By CHARLES D. SHAW. (Price 2s. 6d. Ginn.)

This is a pleasantly written little volume, differing but slightly from several other books dealing with the same subject which have lately appeared. It is clearly intended for quite young children who will have no difficulty in understanding the simple language. The cautious critic might perhaps regret that the style is not more literary, and the phraseology not a little less modern, for so much of the charm of these legends and myths lies in the telling, which requires considerable art. The historical stories are carefully and accurately told, and the illustrations are excellent.

An Introductory History of England. By C. R. L. FLETCHER, Fellow of Magdalen College, Oxford. (Price 7s. 6d. Murray.)

It is a little difficult to understand the *raison d'être* of Mr. Fletcher's book in spite of the interesting preface bristling with all kinds of debatable matter. The author's apology for its appearance is that "certain young gentlemen . . . were always complaining that they found history intolerably dull," but there is really no reason why they should have done so, for the teaching of history has vastly improved during the last few years, and for interesting reading no better book could be put into a boy's hand than Green's "History of the British People." Mr. Fletcher's book is written in an easy, direct manner, which will appeal to boys, but it is doubtful whether it is a good thing to accustom the young to a very familiar and colloquial style, with "can'ts" and "don'ts" and "anyhows" and "a lot of glass beads," and similar expressions plentifully besprinkled. It would be unfair to the author, however, not to recognize the many excellent qualities of his book; he gives most interesting accounts of the Saxon settlements, of primitive justice, and of feudalism, and his chapter on the Legal and Social System of the Thirteenth Century calls for special praise. The maps are exceedingly clear, and the plan of the Manor of Tunney, 1090, will explain much concerning the land system of the Middle Ages. For a book that aims, above all, at interesting its reader it is a pity, however, that more use was not made of the literature of the period to illustrate its manners and customs.

Samuel Johnson; Oliver Goldsmith. By LORD MACAULAY. With Introduction, Notes, &c., by H. B. COTTERILL, M.A. (Price 2s. Macmillan.)

It is very rare for a reviewer to take up an annotated edition of a well known classic with anything but the most languid interest. He is prepared to find long and learned dissertations on words and phrases, elaborate and often quite unnecessary paraphrases, grammatical

disquisitions and all the rest of the paraphernalia dear to the scholarly commentator. An unexpected pleasure is therefore in store for those who are fortunate enough to come across Mr. Cotterill's edition of these two of Macaulay's Essays. In his preface to the "Johnson" Mr. Cotterill writes: "The one important object of annotation in the case of literature, as it seems to me, is to help the reader to understand and enjoy the writer's message—not to parse and derive his words, analyse his periods, and prate about metonymy, hendiadys, and oxymorons," and he has throughout his notes kept to this point of view, with the result that it would be impossible for a student not to desire to know more concerning the subjects of the Essays. The notes cannot, indeed, be too highly praised; to a large extent they consist of extracts from Boswell's "Johnson" and from contemporary writers which throw much light on the work and character of both Johnson and Goldsmith. Where the editor indulges in critical remarks they are of a highly interesting nature, marked by real literary judgment and a command of subtle irony which will perhaps be lost on the young student, but are a source of keen delight to older readers. Mr. Cotterill's talent would seem to indicate that he is capable of adding to the small number of literary essays which the last few years have produced, and it is to be hoped that he will soon see his way to doing this.

Poetical Works of William Wordsworth. With Introduction and Notes. Edited by THOMAS HUTCHINSON, M.A. (Frowde.)

Nothing but unqualified praise can be given to this admirable volume, which may certainly be considered the definitive edition of Wordsworth's writings. It contains all the prefaces, the prose writings, as well as Wordsworth's own notes to his poems. The editor has drawn up an excellent chronological table of the life of the poet, which also serves as an admirable epitome of the literature between 1725 and 1850 which should be invaluable to the young student. Prof. Dowden's interesting and illuminating note on the grouping of the miscellaneous sonnets, which is given on page 901, increases the value of the volume, which is printed on very thin paper and is consequently of convenient size.

Our Bodies and how we Live. By ALBERT F. BLAISDELL. (Price 3s. Ginn & Co.)

This is a book something after the style of that well known work "The Making of the Body," and, as it has stood the test of twenty years' use in the United States, and has now been fully revised, it may be supposed that it has met with considerable appreciation in its native land. It contains the simple information imparted to children under the name of "elementary physiology," which is really a blend of anatomy, histology, physiology, and hygiene. In connexion with the last named subject it will be noticed that this work deals more fully than is usually the case in English manuals of the kind with the subject of the use of alcohol and tobacco. These matters, and particularly the subject of alcohol, are required to be taught in elementary schools by the legislatures of certain of the United States. It will be remembered that a very largely signed petition from the medical men of this country has recently been presented to our Education Office, praying that instruction of a similar character may be made compulsory in the schools of South Britain. The book under review is well illustrated, and there is a series of questions at the end of each chapter. We must confess that its attractiveness is rather marred, in our estimation, by the American spelling of many of the words; but perhaps this is one of the things which should be suffered in silence.

The Becquerel Rays and the Properties of Radium. By Hon.

R. J. STRUTT. (Price 8s. 6d. net. Edward Arnold.)

This cannot be described in any sense as a school-book, but is rather a manual for the advanced University student or even for his teacher. It sets out to give an account of the various substances which produce "rays" or "emanations," substances more numerous than is supposed by the general reader who knows, or thinks he knows, something about radium and has probably never even heard of such things as uranium, thorium, actinium, and polonium. Yet the second of these is present in the common Welsbach gas mantle, and, before it has been burnt, will print off a pattern of the mantle on a photographic plate in the dark, by means of the emanations which it gives off. And polonium—whether a genuine element or not; for on this opinions differ—has certain most curious characteristics upon which it is impossible for us to touch here. We can commend the book to the persons for whom it is intended, and may call special attention to the experiments detailed in one of the appendices.

Notes on the Composition of Scientific Papers. By T. CLIFFORD ALLBUTT. (Price 3s. net. Macmillan.)

Those who are condemned to wade through a large number of scientific papers every year must often sigh for the days of Tyson and Brown, when writers, if less erudite or even accurate, at least dealt with their subjects in fine, sonorous, classical prose. Prof. Clifford Allbutt having suffered many things from many theses in his position as Regius Professor of Medicine at Cambridge, has been moved to set down some of the most common errors of manner, as opposed to matter, which he is in the habit of discovering in the exercises presented to him for the degrees of M.B. and M.D. This being the

origin of the book, it will be readily understood that a number of the awful examples are medical in their nature, but he that would thence conclude that the book is one which is only intended for, or likely to be useful to, medical men, whether embryonic or hatched, would be guilty of a great mistake, for the book is one which might be read with pleasure and profit by nine out of every ten of our writers of to-day. The introductory chapter is particularly delightful, and contains many shrewd suggestions from which we must be allowed to extract one addressed to young authors "prone to eccentricity and finery of style," who are rebuked for their "violent metaphors, odd spellings, slang, split infinitives, and such tinsel." To the inquiry why such methods should not be used if their user thinks them effective, the Professor replies: "Because, young man, you may not paint and patch your mother's cheeks. Dauber as you are, go down upon your knees before your noble inheritance—the noblest speech that the world has seen: when you have known its loveliness, when your ears have opened to its melodies, when you have counted but a little of its riches, you will shudder as at the thought of retouching a masterpiece." This is a thoroughly delightful book, and we can most strongly recommend its perusal to all young writers.

The Natural History of some Common Animals. By OSWALD H. LATTER, M.A. (Cambridge University Press.)

We are very favourably impressed by Mr. Latter's book, and the author is to be congratulated on having produced an excellent work. The main object of the volume is to set forth the natural history of the usual types of animal structure referred to in an elementary course. As a matter of fact the author has omitted the smaller of these types and has only included those whose habits can be observed without the use of the microscope. A new feature in any elementary work is the discussion of the dragon-fly and the wasp, and the author justifies their inclusion by illustrating the phenomena of metamorphosis, which is not to be found in the cockroach. Teachers of biology often find that students, as a result of their work in the laboratories, get in the habit of looking on the animals and plants they observe only as they appear when laid out in the dissecting dish or cut into sections for microscopical purposes. The zoologist too often works only with his eye glued to the microscope: he takes too narrow and restricted a view of his subject. Mr. Latter has, we hope, done much to counteract this tendency. It is not sufficient to teach elementary zoology by means of structure only, but it is most important to make students view it from the standpoint of function as well. Each animal discussed is presented to the reader as a living thing, a machine of whose workings we have some knowledge, but concerning which much is yet to be ascertained. The author, we observe, does not shrink from dealing in some detail, where necessary, with processes of generation. The book is intended for young students, and there are people who consider it necessary to avoid these matters or omit them entirely. Such a course we believe to be based on a wrong assumption and liable to produce the very effects that it is intended to prevent. In the hands of our author, who is a teacher of some sixteen years' experience, the facts are handled in the best possible way. The volume is one of the "Cambridge Biological Series," edited under the supervision of Mr. Arthur Shipley, of Christ's College, Cambridge. Much praise is due to the illustrations and to the careful way in which the lettering has been done. We can confidently recommend the book to teachers of science.

Electricity in the service of Man. By Prof. WALMESLEY. New Edition. (Price 10s. 6d. net. Cassell.)

A work with this title, virtually a translation of Urbanitzki, was published in 1888, but it has been so modified and transformed by addition and substitution in succeeding editions that, like the Irishman's gun, the identity consists solely in the title and ownership. The present edition extends to 1,208 pages, with as many illustrations, besides several folding plates giving full working plans of machines. As head of the Electrical Engineering Department of the Northampton Institute the author has enjoyed singular opportunities of following the latest developments of electricity and procuring details of the newest machines. Our wonder is how the book can have been produced at the price. We may call the author's attention to a remarkable anticipation of the electric telegraph in the Latin "Prolusiones" of Famian Strada (1572-1649.) We will quote from it a couple of lines:—

"Magnesi genus est lapidis mirabile . . .
Quotquot eum lapidem tetigere styli, simul omnes
Conspirare situm motumque videbis in unum."

Biart's Monsieur Pinson. Adapted and edited by OTTO SIEPMANN. (Macmillan.)

This last volume of the "Elementary French Series" is well adapted for Naval Cadets, the subject being an imaginary incident of the War of Secession. It seems to us a mistake to have omitted the earlier chapters when the scene is laid in London and Liverpool, as it spoils the interest of the story not to know how the hero, a French engineer, found himself on board a Federal frigate, or how he became attached to Vif-Argent, his boy Achates. If exigencies of space necessitated the omission, the clue should have been given in the preface, and we could well have spared the biographical notice of Lucien Biart "conveyed"

from the "Schriftsteller-Lexicon." The notes are full and accurate, and we can offer only one or two emendations. *Il ne me manquait plus que cela* is not ironical, but elliptical—"Only that was lacking to crown my misfortunes." *Viver de bord* is not "to veer round," but "to tack about." *On* is from *hominem*, not *homo*.

The Masters of English Literature. By STEPHEN GWYNN. (6¼ × 4¾ in., pp. xiii, 424; price 3s. 6d. Macmillan.)

The plan of this volume is a good one, and the execution is also good. Mr. Gwynn has chosen some forty of the greater names in English literature, and has dealt with them biographically and critically, leaving the smaller folk alone, or referring to them only very slightly in passing. There is nothing new in the idea, but it is well carried out. In writing his chapters, the author has placed great reliance on the "English Men of Letters" series, and certainly he could not have chosen a better—whether he be dealing with biographical criticism, as in Mark Pattison's "Milton"; or with the art of poetry, as in Colvin's "Keats"—and he evidently approves Prof. Raleigh's "Wordsworth." As to the kind of information Mr. Gwynn makes it his first aim to provide, the following quotation will show clearly enough:—"It is not too much to say that an educated man who knows what manner of poetry Thomson wrote, and in what age he wrote it, may well be excused for not knowing more." This, at any rate, the book seeks to provide, "while it refuses steadfastly to tell the reader anything at all about such excellent but unessential persons as Akenside or Rogers." And all along he endeavours—not to substitute his own words about the authors and their doings for the authors themselves, but to send the student "to those masters of literature of whom he has learnt enough to wish to learn more." And in no case has he done his work better than in his brief chapter on "Milton." It is admirable. But we must not choose out special parts for praise. We leave the book as a whole to the appreciation of those lovers of good literature—schoolmasters and schoolmistresses—who will find it very much to their purpose. At the end of the book there is a good and full index.

The London University Guide, 1905, containing the regulations for examinations to be held in 1905 and 1906, is sent us by University Correspondence College. It seems to us a useful book of reference.

Messrs. Blackie & Sons send us a small copy of Carlyle's well known *Essay on Burns*, with biographical and critical introduction and notes. The notes seem to us well done and are commendably few. The introduction, too, is carefully written; but it was hardly needed as an introduction to the *Essay*—which in fact it does not introduce at all.

Messrs. George Gill send us *The Modern Language Calendar*. (Price 1s. 6d. net.) Schoolboys "non dies numerant nisi serenos," but it would be a good idea to supply a modern-side class with a Calendar and see that they know the French and German equivalent for the daily *mot* or proverb.

ERRATUM.—The quotation given under "Japanese Grammar Self-taught" is taken from Hossfeld's "Japanese Grammar," by the same author, and reviewed under the same head. We have received from the author a lengthy protest (not for publication) setting forth his distinctions as a lecturer and writer on several European languages. Our reviewer, to whom we forwarded it, writes: "I regret having hurt the author's feelings by dismissing his two Japanese books in a few uncomplimentary lines. My first impression was that he had simply turned out books on Japanese because Japan was very much to the fore at present. His letter shows that in this view I was mistaken, and that he intended them as a serious contribution to our knowledge of Japanese. I am only too glad to find one more person genuinely interested in questions of modern philology generally and the Japanese language in particular, and shall be happy to discuss the whole matter with him. Such a discussion would be obviously out of place in your columns, and I therefore subscribe myself: E. R. EDWARDS, Docteur de l'Université de Paris, Lecturer at University College, London, Author of 'Etude Phonétique de la Langue Japonaise.'"

GIFT BOOKS.

BLACKIE & SON.

God's Bairn. By DOROTHEA MOORE. (Price 3s. 6d.)—A charming story of the Fen country in the days of Charles I. One doubts if a new-born babe would have survived being left, even for a short time, lying on a stone step in a damp church with only a soldier's cloak round it; but that may be willingly passed over, since the little waif turns into such a brave defender of the old and weak and enlists all our sympathies. The old Clerk and the old Vicar are excellently drawn.

The White Standard. By ELIZA F. POLLARD. (Price 2s. 6d.)—This is really the story of Joan of Arc, though, in the beginning, it

follows the fortunes of Margaret of Scotland, whose ill fate it was to be married to the boorish and malicious Dauphin, afterwards Louis XI. She and her chosen companion become devoted admirers of the Maid, who is pictured as all that is gentle and womanly. It is nicely written, but the theme is a sad one.

Hope's Tryst. By BESSIE MARCHANT. (Price 3s. 6d.)—A well written and interesting story of an English family in Russia. Hope's uncle, who has served the Russian Government, falls into disgrace—really by her father's fault—and is sent to the Kara mines. His wife, with Hope and her father, go to live at Kiakhta on the chance of his one day escaping. It gives a dismal picture of life in Russia, the hardships of the climate, and continual police supervision; but happily all ends well.

Jefferson Junior. By MEREDITH FLETCHER. (Price 3s. 6d.)—The writer, Graham Clarence St. Clair Lilley, is an extremely venturesome and irrepressible youngster of tender years, who, in the course of his first term at school treats masters and boys alike to more plain speaking than they are at all accustomed to. Many are the scrapes he and his chums get into, and they make an amusing school story.

At the King's Right Hand. By Mrs. FIELD. (Price 3s. 6d. Wells Gardner, Darton, & Co.)—A tale of King Alfred's days, when the wild Danes were constantly harrying Saxon villages. Such a raid leaves Oswald fatherless, and his mother and himself captives. He escapes, and finally becomes, what he has always looked on as the goal of his desires, King Alfred's constant attendant in peace and war. Alfred's character and his struggles against the indolence and weakness of his own people, no less than against the Danes, are well described.

The President's Scouts. By HERBERT HAYENS. (Price 5s. Collins' Clear-type Press.)—A stirring tale of the Chilian Revolution. The hero is a little too fond of explaining that he did not wish to perform various acts of bravery, but was, as it were, forced into them; but to any one who likes constant movement and spirited descriptions of innumerable fights, desperate attempts to redeem a lost cause, this book should prove very attractive.

The Queen's Knight Errant. By BEATRICE MARSHALL. (Price 5s. Seeley.)—Miss Marshall writes well, and has pressed into her service most of the prominent men of Elizabeth's Court (she fares badly in Miss Marshall's hands) when Raleigh was at the height of his favour with her. Iris, the heroine, was rescued from the sea after a storm, and brought up by a Devon squire. She is in general the merriest of maidens, but deep in her mind lies a memory of another land and other faces, which at intervals gives to her eyes a far-away gaze, and brings strange words to her lips. This is a little overdone, and would be more effective if it occurred less often. The book is pleasant to read, and has some quaint and pretty illustrations.

The Adventures of Cock Robin and his Mate. By R. KEARTON. (Price 6s. Cassell.)—A delightful book for children: who would not long, after reading these adventures, to go out and find nests for themselves and watch their feathered neighbours repeating, in their various ways, the old robin's experiences? We must confess that he is occasionally long winded and makes use of long words, but he has so much that is interesting to say and the clear dainty photographs are so attractive that one may easily pass over his tendency to "hold forth." The picture of the hooded crows trying over their notes is irresistibly comic, and what could be prettier than "hoar frost?"

Cassell's Saturday Journal. Yearly Volume. (Price 7s. 6d.)—This year's volume is well up to its usual mark, and contains an astonishing quantity of information which will meet the needs of very diverse readers. The serial stories teem with thrilling incidents, while the life pictures, whether from beach and cliff, from the police court or quest of adventure, run them hard in the way of excitement; nor are the stories of plot and counterplot far behind. There is a long list of notabilities of the day who have been interviewed with success, while the space that remains is filled with paragraphs short or long on every variety of subject, from a morning at the Palace to preparing for the Cattle Show.

Island Nights Entertainments. By ROBERT LOUIS STEVENSON. (Price 2s. net. Cassell.)—A pretty little volume, bound in red cloth, the print good and clear, and a portrait of "Uma" for a frontispiece.

The Getting Well of Dorothy. By Mrs. W. K. CLIFFORD. (Price 2s. 6d. Methuen.)—Mrs. Clifford has the power of catching thoughts and feelings and making them live again in the pages of her book. If we feel this story more suited in parts to parents than children, it is not because Dorothy and Betty could fail to make friends amongst younger readers, but that some of the best parts of the book might hurry them on through the time of un-self-conscious happiness in a way Mrs. Clifford herself speaks of with regret. Here is but one of the sentences which lend a charm to the book. "When you are very happy, it seems a pity to put the sound of your voice into the still world."

The Pedlar's Pack. By Mrs. ALFRED BALDWIN. (Price 6s. Chambers.)—Brothers and their adventures, giants, robbers, kings, and magicians all have their place in this substantial pack of stories. They are pleasantly written, and illustrated by coloured pictures and pen-and-ink sketches. The latter are particularly good.

The Star in the West. By MARY H. DEBENHAM. (Price 2s. 6d., National Society.)—The "star" is the light of the Welsh Church kept alive by the faithful few in the midst of the lawlessness of the sixth century, when each chief only waited an opportunity to fall upon his neighbours, and Saxon and Pictish raids left burning homes and wasted lands behind them. The story is well told, and its interest centres in Enid, the tall daughter of Hoel, and her brother Peredur the Bard. Historic characters appear in it, too—the Abbot Cadoc of Llancarfan, and Gildas the Monk, whose strong personality and fiery enthusiasm impress the most violent and reckless. Enid is a pleasant mixture of strength and sweetness, and contrasts well with her foster-sister the Princess Eysyllt, whom she guards so tenderly.

The Commander of the "Hirondelle." By W. H. FITCHETT. (Price 6s. Smith, Elder.)—An exciting sea story of Nelson's days. The hero, Harry Gaunt, is chiefly employed in carrying dispatches and obtaining information as to the whereabouts of the French and Spanish fleets, having been put in command of a fast brig he has succeeded in capturing from the French. While on this duty he comes in for perils of all kinds, so that those most greedy for adventures cannot fail to be satisfied. Danger and difficulty have the effect of steadying his judgment, and he manages to keep a cool head throughout without annoying the reader. The book is well illustrated.

"Red Cap Tales."—*Waverley; Guy Mannering; Rob Roy; The Antiquary.* By S. R. CROCKETT. (Price 6s. A. & C. Black.)—Mr. Crockett, acting the part of a Charles Lamb to "The Wizard of the North," offers to his young readers tales which will delight them, put in a setting different from those old settings of moral tales as "Sweetheart" and "Sir Toady Lion" from "Jane and Edward." That steadily writing hand to which the children are introduced was significant of more than mere prolixity—of a vital element of Scott's style. To have four of the novels retold in four hundred pages is to have Scott no longer. Mr. Crockett is the first to own this. Yet the stories, though at times they seem too much condensed, are told by some one who delights in them, and so makes the character his again. The interludes may seem a somewhat needless distraction, in so good a story book, but, may be, children who know "Sweetheart" of old will be helped to take the stories aright by learning how these children "took them." It might be suggested that some children have listened with no preliminaries to Scott as he stood, when read aloud. The book is light to hold, well printed, and with well coloured illustrations.

Messrs. A. & C. Black send us *Cook's Voyage* (price 3s. 6d.), edited by JOHN BARROW, and illustrated by JOHN WILLIAMSON; and *Gulliver's Travels* (price 6s.), illustrated by S. B. DE LA BÈRE. Both volumes have coloured pictures. Those in "Cook's Voyage" vary a good deal, some being harmonious in colour, others rather too hard and bright. In "Gulliver's Travels," which is well got up, the pictures are of a quaint, not to say grotesque, character, in brilliant colours; but they are effective.

We have received from Messrs. Macmillan a pretty edition of *Alice in Wonderland* and *Alice through the Looking Glass*, by LEWIS CARROLL, illustrated by JOHN TENNIEL. The print is large and clear and the volumes are bound in blue cloth, 2s. net each.

CALENDAR FOR JANUARY.

[Items for next month's Calendar are invited. Matter should reach the office, 3 Broadway, Ludgate Hill, London, E.C., by the 23rd inst.]

- 3-7.—College of Preceptors Examination of Teachers for Diplomas.
- 4.—Assistant Masters' Association. Meeting at Mercers' School, Holborn. 10 a.m.
- 4-5.—Educational Institute of Scotland. Thirty-first Annual Congress at the Town Hall, Ayr.
- 5-7.—London County Council Conference of Primary, Secondary, and Technical Teachers at Medical Examination Hall, Victoria Embankment. 11 a.m. (The meeting on January 7 is in conjunction with the Froebel Society.)
- 6.—Geographical Association. Meeting at Royal Colonial Institute, Northumberland Avenue. 4 p.m.
- 6-7.—Classical Association. Meeting at University College, Gower Street.
- 6-7.—North of England Education Conference. Third Annual Meeting. St. George's Hall, Liverpool.
- 7.—London University Inter. Mus., B. Mus., and D. Mus. Pass Lists published.
- 9-11.—London University Matriculation Examination.
- 11-12.—Incorporated Association of Head Masters. Meeting at the Guildhall. 11 a.m.
- 12-13.—Modern Language Association. Meeting at Manchester University. 2 p.m. first day; 10 a.m. second day.
- 14.—Public Schools Science Masters' Association. Annual Conference at Westminster School. 2.30 p.m.

- 14.—Assistant Mistresses' Association. Meeting at Dr. Williams's Library. 10.30 a.m.
- 15.—Post Translations for *The Journal of Education* Prize Competitions.
- 16.—Royal Drawing Society. General Meeting in Caxton Hall, Westminster.
- 23.—Post School News, items for this Calendar, &c., and Advertisements for the February issue of *The Journal of Education*.
- 26 (first post).—Latest time for receiving prepaid School and Teachers' Advertisements for the February issue of *The Journal of Education*.

The February issue of *The Journal of Education* will be published on Tuesday, January 31, 1905.

HOLIDAY COURSES.

NANCY.—All the year round. French. Apply—Monsieur Laurent, à l'Université, Nancy.
PARIS.—Christmas and Easter Holidays. Apply—Monsieur Louis Jadot, 95 boulevard Saint Michel, Paris.

UNIVERSITIES AND SCHOOLS.

BEDFORD COLLEGE FOR WOMEN.

The Council have appointed Miss Mary Morton, Classical Tripos, Cambridge, to be Head of the Training Department for Secondary Teachers, in the place of Miss Robertson, who has taken work under the Leeds University.

A scholarship for the course to begin in January has been awarded to Miss E. M. Wainwright, B.A., of Westfield College.

The Council have appointed Miss Isabel A. Dickson, M.A., Classical Tripos, Cambridge, to be Principal's Deputy during the Lent Term; and Miss M. B. Strachan, M.A., to be Librarian; and Miss L. E. Farrer, B.A., to be Assistant in French.

The George Smith Studentship on the result of the Final Honours Examination in English has been awarded by the University of London to Miss K. M. Shepherd, of Bedford College.

The following students of the College have been successful in the B.A. and B.Sc. Examinations of the University of London:—B.A. Honours—E. B. Abrahams (Classics), K. M. Shepherd (English), H. E. Tunnicliff (English), T. E. M. Purver (French). B.A. Pass—E. M. E. Haydon, E. M. Launder, H. A. Newcombe, G. M. L. D. Nicholls, G. E. W. Preston, D. Wimbush. B.Sc. Honours—A. M. Cooke (Physics), W. Gibson (Mathematics). B.Sc. Pass—G. E. Bennet, M. E. Tyas.

KING'S COLLEGE, WOMEN'S DEPARTMENT.

The New Year opens under bright auspices. After much strenuous effort, the debt which has so long hampered us has been paid, and our energies can now be devoted to much needed improvement of the library and of laboratory equipment. Last term was a record one in the history of the Department. There were 367 students, including 80 who were reading for examinations. Of these, 70 were working for a degree or its Oxford equivalent. There are 2 M.A., 8 B.A. Honours, and 6 Oxford Honours candidates at present in the college. The new scheme of Biblical study, comprising lectures for teachers and others on such subjects as the New and Old Testaments, Philosophy of Religion, Greek Testament, and Hebrew, has proved most successful. Miss Gradwell's lectures on "Business Habits for Women" have been a new feature, and have attracted a good many outside students. They have dealt with such subjects as business correspondence, the management and investment of money, banking, trustee investments, and legal documents. The course will be continued during the ensuing term. The Art Department, reorganized under the direction of Mr. Vicat Cole, Mr. Byam Shaw, and Mr. Pownall, now contains thirty students. One of its most recent achievements was to paint the scenery required by the Dramatic Society for their performance in aid of the King's College Guild (affiliated to St. Helen's House, Stratford). Its more serious work will be inspected by Mr. Seymour Lucas and Mr. David Murray at the end of January.

The most recent subject for congratulation is the award of the Fellowship of King's College to our Vice-Principal, Miss L. M. Faithfull.

CAMBRIDGE.

The Report of the Studies and Examinations Syndicate, with its proposals for the reform of the Previous Examination, has been, and remains, the event of the term. It is dealt with elsewhere. But the three days

debate in the Senate House deserves mention for the number and the vigour of the speeches it evoked. Not even the famous discussion on women's degrees stirred the University so deeply. Whatever may be thought of the arguments on either side, one could not but realize that the speakers were impressed with the seriousness of the question, and its profound bearing on the future of the University and of English education. The speeches have been printed in a special number of the *University Reporter*, dated December 17. The report will be referred back to the Syndicate for reconsideration of details; but its principle will doubtless stand, and be submitted to the Senate for decision next term.

The Local Lectures Syndicate report a revival of interest in the Extension movement. Last session 119 courses were delivered in 102 centres, as against 109 in 96 centres in the previous year. The Summer Meeting at Exeter was attended by over 700 students, and justified the experiment of holding the Meeting away from Cambridge—for once in a way.

The important proposal for the mutual recognition by Oxford, Cambridge, and London of their several entrance or matriculation certificates was approved *unanimously*, and is now, so far as Cambridge is concerned, in full operation.

The Fishmongers' Company and Sir D. L. Salomons have provided for the endowment of a Lectureship in Russian, with a stipend of £60 a year for five years. The present

Endowments.

Salomons Lecturer, Mr. Goudy, has fully justified the original establishment of the Lectureship, and it is obvious that the need for instruction in the Russian language and literature, not only by student-interpreters, is likely to increase rather than diminish.

The amount of the University Benefaction Fund has risen to £75,000, the greater portion being ear-marked for special purposes. Prof. Woodhead has enlisted the interest of a number of citizens of Huddersfield in the work of the Pathology Department, with the result that he has collected some £1,800 for the endowment of a new "Huddersfield" Lectureship in Special Pathology. The idea of a collective benefaction was first started by Prof. Skeat, who thus brought about the establishment of the Lectureship in English. Prof. Woodhead has grafted the "territorial" idea on Dr. Skeat's, with satisfactory results. Other heads of departments, who are clamouring for increase of staff or equipment, might well follow these pioneers. A bequest of £9,000 for science by Mr. Gordon Wigan, and of valuable additions to the Library, the Observatory, and other departments by the late Mr. Frank McClean, are also announced. The University Association for the re-endowment of the University is vindicating itself. It has just circulated an appeal to all members and friends of the University for the ampler equipment of the University Library.

The proposal to improve the mode of election to the Lady Margaret and Norrisian Chairs of Divinity, and the Regius Professorships of Greek, Divinity, and Hebrew, by constituting for each a special electoral board, was rejected by the Senate, which clings to privilege and distrusts experts.

A new diploma in Mining Engineering, open to candidates who have kept nine terms and have pursued a course of study and examinations in the cognate subjects, is to be established, in pursuance of an Act of Parliament (1903) for the regulation of mines. The Act empowers the Home Secretary to issue certificates qualifying for the position of colliery manager, after a shortened period of service in a mine, to University graduates who possess certain scientific and technical qualifications.

Mining Diploma.

The regulations for the Special Examination in Geography, and the Diploma in Geography, have been issued by the Board of Studies. They certainly do not err on the side of narrowness or over-facility. The candidate who passes either examination will be entitled to claim a wide range of expert knowledge in his subject.

Geography.

In the recent open competition for the Home and Indian Civil Service, twenty-seven Cambridge candidates were successful. Ten of these had taken the Mathematical Tripos, and fourteen the Classical Tripos. History, Modern Languages, and Natural Science accounted for the others. The highest places in Latin, in French, in Mathematics, and in Science are taken by Cambridge men.

Civil Service Examinations.

Scholarships.

The great entrance scholarship examinations held by the twelve colleges—Trinity, Trinity Hall, Clare, Sidney, Peterhouse; and Pembroke, Caius, King's, Jesus, Christ's, St. John's, Emmanuel—have attracted the usual number (over 300) of competitors. Out of some 155 awards of various kinds, St. Paul's School has secured 8; Eton, Tonbridge, Rugby, and Uppingham, 6 each; Charterhouse and Bradford, 5 each; King Edward's (Birmingham), Haileybury, Cheltenham, Dulwich, and Marlborough, 4 each. Harrow, Owen's (Islington), Rossall, Mill Hill St. Olave's (Southwark), City of London, Repton, Blundell's (Tiver-

ton), in Merchant Taylors' are each represented by 3 successful candidates. The remainder of the awards are shared by 52 schools.

The following elections and appointments are announced:—
Mr. H. M. Taylor (Trinity), Mr. F. Whitting (King's), and Prof. Sorley (King's), University members of the Borough Council; the Right Rev.

Appointments.

G. L. King (Clare), Bishop in Madagascar, and the Right Rev. St. C. G. A. Donaldson (Trinity), Bishop of Brisbane, to be D.D. *honoris causa*; Mr. H. W. V. Temperley (King's), History Fellowship at Peterhouse; Mr. R. H. Lock, Science Fellowship at Caius; Dr. A. C. Haddon, Senior Fellowship at Christ's; Mr. E. Edwards (St. John's), Governor of University College, Aberystwyth; Rev. J. Twentyman (Christ's), Governor of Mansfield Grammar School; Rev. Dr. H. H. B. Ayles (St. John's), Governor of Calthorpe and Edwards Educational Endowment, Ampton; Dr. W. H. R. Rivers (St. John's) and Prof. Thomson (Trinity), Managers of Arnold Gerstenberg Studentship; Mr. J. C. Willis, approved for Sc.D. degree; Mr. V. P. Row (St. John's), Bhaunagar (India Civil Service) Medal; Dr. Waldstein (King's), member of Advisory Board of Architectural Education; the President of Queens', the Master of Gonville and Caius, Prof. R. C. Jebb, Prof. Darwin, Dr. Keynes, Mr. Mollison (Clare), Mr. Parry (Trinity), Mr. Shipley (Christ's), members of the Council of the Senate; Mr. A. Young, Mathematical Fellowship at Clare; Mr. R. P. Gregory (Natural Science), Mr. G. Norwood (Classics), Mr. E. Cunningham (Mathematics), Fellowships at St. John's College; Dr. Baker (St. John's), Prof. Browne (Pembroke), and Mr. Neville (Sidney), members of the General Board of Studies; Dr. Keynes, member of the Joint Scholarships Board (Head Masters' Association); Dr. C. S. Myers (Caius), Demonstrator of Experimental Psychology; Mr. R. P. Gregory (St. John's) and Mr. K. Lucas (Trinity), Walsingham Medals in Biology; Rev. F. J. Fulford (Clare), member of West Suffolk Education Committee; T. A. Nock (Pembroke) and A. E. Talbot (Emmanuel), Carus Greek Testament Prizes; Mr. H. G. Wood, Classical and Theological Fellowship at Jesus; Mr. J. H. Jeans (Trinity), University Lecturer in Mathematics; Mr. F. F. Blackman (St. John's), Reader in Botany; A. H. Lloyd (Caius), Members' Latin Essay Prize; F. W. Fulford (Jesus) and J. R. Darbyshire (Emmanuel), Jeremie Septuagint Prizes; Right Rev. A. J. Maclean (King's), Bishop of Moray, Ross, and Caithness, to be D.D. *honoris causa*; Mr. F. H. Wood (St. John's), Seatonian (Sacred Verse) Prize; Mr. M. Lal (St. John's), Colden (Economics) Prize; Dr. Donald MacAlister (St. John's), President of the General Medical Council.

THE CAMBRIDGE TRAINING COLLEGE.

A scholarship of the value of £40 has been awarded by the Council to Miss E. Barnard, of Girtton College, Classical Tripos, Class II., and one of £30 to Miss E. Haughton, Owens College, Manchester, B.A. Victoria, Classical Honours, Class II. Bursaries of the value of £20 each have been awarded to Miss R. Cripps, B.A. Lond., Miss E. Minero, B.A. Lond., and Miss A. Heath, B.A. Lond., all of the Royal Holloway College.

MANCHESTER.

Mr. W. G. S. Adams, M.A., Lecturer in Economic History and Commerce, has been appointed Superintendent of the Statistics and Intelligence Branch of the Department of Agriculture and Technical Instruction for Ireland. He is succeeded in his Lectureships at Manchester by Mr. H. O. Meredith, M.A., Fellow of King's College, Cambridge. As regards the work of University Extension, the Council have invited applications for the post of Secretary to the Extension Committee, and the holder will be required to give the whole of his time to this branch. A valuable addition has been made to the University Library by the gift on the part of Mrs. W. T. Arnold of a collection of her late husband's books bearing on Roman history. Mr. W. G. Duffield, B.A. (Cant.), B.Sc. (Adelaide), has been appointed research Fellow in Physics, Mr. A. Holt, B.A., research student in Chemistry, and Prof. Fujii, of Tokio, research student in Botany. The final B.A. and B.Sc. lists contain eleven names, seven of whom are women. Fourteen candidates for degrees in Arts and Science were presented at the degree ceremony on December 16.

An interesting but belated publication has just appeared in the form of the "Students' Blue Book," which is issued under the auspices of the Students' Representative Council. It contains an immense amount of detail with reference to the constitutional work of the Council, articles on the various Faculties, full particulars of the many clubs and societies, and short biographical sketches of the professors of the University. The references to the halls of residence are interesting at the present juncture, when Dr. E. B. England is retiring from the post of Warden of Hulse Hall. At a dinner recently given in Dr. England's honour, the Vice-Chancellor presiding, a presentation of plate was made to him. Dr. England is succeeded by Mr. J. H. Hopkinson, M.A., late scholar of University College, Oxford, and

Craven University Fellow for Archaeology, son of the Vice-Chancellor of the University. Hulme Hall has accommodation for thirty men, but its older sister, Dalton Hall, accommodates fifty-two, and both halls are generally full. The question of an additional hall of residence has been very warmly discussed by the Students' Representative Council, but nothing is yet settled with regard to the matter. At present there are close upon a hundred and fifty students in lodgings, and it is suggested that, if a hall were opened with accommodation for two hundred, the supply would create the demand.

A very cordial reception was given by the students of the University to Captain Scott on the occasion of his visit to Manchester. On the day following his lecture in the Free Trade Hall he was the guest of the students in the Whitworth Hall, and made a very humorous reply to the address presented to him. He afterwards drew a picture of a penguin on a blackboard, which will be preserved, just as a similar drawing of the "Fram" by Dr. Nansen is carefully treasured. At the conclusion the undergraduates took the horses out of the carriage and drew Captain Scott and his host to Prof. Schuster's house.

The opening of the Fielding School has been heralded by a wide distribution of the prospectus over South Manchester. The school will be opened in January, the Head Master being Mr. W. J. Deeley, B.A., formerly assistant master and house tutor at the Cardiff Intermediate School. He is fortunate to be assisted by Mr. S. E. Maltby, B.A., one of the tutors of Dalton Hall. The school will probably open with two small classes. There is to be an option between French and German taught by reformed methods; elementary practical physics is one of the compulsory subjects.

The Joint Matriculation Board (Manchester, Liverpool, and Leeds) have just issued their first Calendar. The work of this Board is of special interest, in so far as it aims at simplifying the system of entrance and school-leaving examinations. In addition to the ordinary Matriculation papers, the Board sets scholarship papers for the convenience of the Education Committees of Lancashire and Cheshire, and also conducts the examinations at schools for a leaving certificate.

The session closed with a most successful *soirée* given by the Union in the University Buildings on December 17—the first given by the newly constituted University Union.

The newly formed University Sociological Society, which was opened by the President, Sir John Gorst, a few weeks ago, is to be addressed by Prof. Sadler in February. The subject of the address is "Slums and Schools." The Women's Debating Society are making efforts to secure Rudyard Kipling for their open meeting in May. The retirement of Prof. Toller from the Chair of English Literature and Language was marked by a presentation on behalf of past and present pupils, at a gathering held on the 30th ult.

At the Grammar School the Old Mancunians' Association, in the formation of which the High Master, Mr. Paton, has taken such a deep interest, has now been successfully set on foot. The Dean of Manchester has accepted the office of Vice-President, a number of sectional clubs have been started, and a reception of members was one of the new features of the annual *conversazione*. Mr. Paton is also to be congratulated on the fact that the work of levelling the new cricket-ground, in which he and the boys have been engaged for the last twelve months, is now practically complete. Recent honours include an open classical scholarship at Trinity College, Oxford; an open classical exhibition at Wadham College; and an open mathematical scholarship at Corpus Christi, at the same University. At the South Manchester School, preparatory to the Grammar School, a speciality is being made of the Nature-study lessons; the boys are cultivating the ground immediately round the school, and the construction of a conservatory is in contemplation.

At the High School for Girls important structural alterations with the same object are now nearly complete. The old physics laboratory, which had been used as a cooking school, has been enlarged and re-lighted and fitted as a biological laboratory for botany and zoology, and a large greenhouse has been built out from it. A new cookery school has been fitted up on the lower floor. The school has recently been inspected by the Board of Education and the University.

Miss Hartley having been appointed Head Mistress of the Elland Schools, her place is to be taken next term by Miss Gladys Marten, of the Ladies' College, Cheltenham. Miss Foster, B.Sc. Lond., has also joined the staff this term.

At the Withington Girls' School one of the events of the term has been a very successful exhibition of handwork of all kinds by past and present pupils. Some very creditable performances of scenes from "Cranford" have been given by the girls this term.

At the last meeting of the Manchester Education Committee a most important statement was made by the Chairman with regard to the Municipal School of Technology. The receipts from fees were shown to have risen this year by about 10 per cent. Though the school was only founded less than three years ago, Sir James Hay thinks that in five years, probably, it will be necessary to increase the accommodation for day students. In congratulating the Committee on this statement, the Dean of Manchester hinted that, in view of the co-ordination which he hoped was in prospect between Manchester and Salford, it

might be possible to make use of the Salford Technical School for the overflow of day students. The number of day students enrolled this session is 427 and the number of evening students is 4,692.

At a special meeting of the Manchester City Justices, held on December 9, the following very important resolution was carried, with only one dissentient:—"That, in the opinion of the justices, it is desirable to set apart a separate room in the police courts to investigate all cases against children and young persons under fourteen years of age, except cases of private summonses for assault and damages." Mr. W. J. Crossley pointed out that in an ordinary room the magistrate could talk to the child more kindly and less formally than in the court.

The Lord Mayor's treats for the children at Christmas (in which he is cordially helped by the school teachers) included the provision of food and recreation each week-day during the holidays, at eighteen centres, for the children from forty elementary schools. About three thousand children on the free-dinner list were so fed and entertained, the programme for each day including breakfast at 9.30, lanterns, shows, and other entertainments during the morning, and a sumptuous dinner to follow.

The Burnley Grammar School question is now regarded as virtually settled. The new Board is to consist of fifteen members, ten (including the Mayor) appointed by the Corporation, one by the County Council, one by the University, and three of the present governors continue in office for three years; after which the first twelve governors co-opt whom they please.

Next year the Manchester Warehousemen's and Clerks' School will celebrate its jubilee. This excellent boarding school, which is unique in its way, provides education for orphans on payment of a premium of one guinea a year, or (in case the parent lives) gives education to his children at reduced fees. It is pleasantly situated in a healthy suburb of Manchester.

Sir Henry Hibbert was able to preside at the meeting of the Lancashire Education Committee on December 19, after an absence of some months. It was stated that in the near future the Committee would have to build sixteen new schools, while the educational problem facing the Committee was described as a "gigantic" one. Special emphasis was laid on the importance of fitting the rural child for rural pursuits, and it was also pointed out that the area was much too large for a uniform rate.

WALES.

A Welsh National Conference, convened by the University of Wales and the Central Welsh Board, and attended by representatives of all the Education Authorities and organizations of Wales, was held at Shrewsbury on November 10 and 11. Principal Griffiths, Vice-Chancellor of the University of Wales, presided at the first session, and in opening the conference expressed the hope that the question of making up the shortage of teachers in Wales would be treated on a national rather than a local basis.

Principal Roberts, Aberystwyth, read a paper on "Some Distinctive Aspects of the Problem of the Training of Teachers as it presents itself in Wales." Probably there was no country in which there was a greater supply of good material or where the general conditions were, on the whole, more favourable to the production of teachers than Wales. The area was large enough, and not too large, for unity of organization in accordance with the distinctive aims of Wales. The first essential was a thorough expert investigation of the needs of Wales in respect of the training of teachers, after consideration of which action should be taken by the Local Authorities on common lines. A permanent Advisory Committee should be part of the organization of the Central Authority, and a Consultative Committee should be instituted by the University of Wales, representing University, secondary, and primary teachers, to advise on courses of study and practice and on the certificates and diplomas granted by the University. The Central Authority and the University should also have representation on the Consultative Committee of the Board of Education.

In the discussion that followed Principal Salmon, Swansea Training College, after pointing out that the Authorities had only a twopenny rate to administer, said that twopence had never been expected to go so far since the time when the Good Samaritan doled out that sum. No additional training colleges for secondary teachers or for elementary men teachers were, in his opinion, necessary, but additional college accommodation was required for women, to produce three hundred elementary women teachers per annum. Subsequent speakers urged that Mr. Salmon had not paid sufficient attention to the understaffing of so many Welsh schools in arriving at his estimate. At the close of the discussion an attempt was made to induce the Conference to pass resolutions embodying the main points on which there seemed to be general agreement, but strong opposition was manifested, and the propositions were withdrawn.

At the second session Mr. Lloyd-George, M.P., presided, and Lord Stanley of Alderley, Chairman of the Anglesey Education Committee,

PARTS I.—VI. NOW READY.

A SCHOOL GEOMETRY.

By H. S. HALL, M.A., and F. H. STEVENS, M.A. Crown 8vo.

This work is based upon the recommendations of the Mathematical Association, and will be found to satisfy the requirements of University, Local, London Matriculation, Army, Navy, and other Examinations. In particular, the suggestions recently proposed by the Cambridge Syndicate have been carefully considered.

PARTS I.—VI. Containing Plane and Solid Geometry, treated both Theoretically and Graphically. 4s. 6d.

PARTS I. and II.—PART I., Lines and Angles, Rectilinear Figures. PART II., Areas of Rectilinear Figures (containing the Substance of Euclid, Book I.). 1s. 6d.

PART III.—Circles (containing the Substance of Euclid, Book III., 1-34, and part of Book IV.). 1s.

PARTS I., II., and III. 2s. 6d.

* This volume exactly suits the requirements of the New Syllabus for the King's Scholarship Examination.

PART IV.—Squares and Rectangles, Geometrical Equivalents of Certain Algebraical Formulae (containing the substance of Euclid, Book II. and Book III., Props. 35-57). Sewed, 6d.

PARTS I.—IV. 3s.

PARTS III. and IV.—Containing the Substance of Euclid, Books II. and III. and part of Book IV. 1s. 6d.

PART V.—Containing the Substance of Euclid, Book VI., with additional Theorems and Examples. 1s. 6d.

PARTS I.—V. 4s. 6d.

PARTS IV. and V.—Containing the Substance of Euclid, Book II., Book III. 3s. 6d.

PART VI.—Containing the Substance of Euclid, Book XI., 1-21, together with Theorems relating to the Surfaces and Volumes of the Simpler Solid Figures. 1s. 6d.

PARTS IV., V., and VI. 2s. 6d.

MACMILLAN & CO., Ltd., St. Martin's Street, London, W.C.

spoke on "The Problem of the Training of Teachers as it presents itself to the Local Authorities." The supply of competent teachers had for years failed to keep pace with the demand, and the pressing problem was to increase the supply of teachers. To attract the right class, the teaching profession must be made attractive by adequate salaries, by a fair social status, and by intelligent management and co-operation. Each county must begin by offering scholarships from about the age of twelve up to sixteen to boys and girls who would undertake to become pupil-teachers. The two years' course as half-timers would prove impracticable, except in large towns. An alternative would be to test applicants at sixteen as junior teachers for one year, and then give them a year's full-time instruction, preparatory to their entering college.

Mr. T. J. Hughes, Chairman of the National Executive of Welsh County Councils, spoke against the utilization of county schools as pupil-teacher centres, but the objections he raised did not, judging from the many cries of dissent, commend themselves to the majority of the representatives. Mr. Lloyd-George referred to the danger of provincialism, and urged that the Conference should pass a resolution to the effect that the training of teachers throughout the Principality should be undertaken by a Central Authority, and not left to the option of individual Local Authorities. Protests were again raised against the passing of resolutions; and, though Mr. Lloyd-George exerted his powers of persuasion to the full, he was unable to induce the Conference to record more than the pious opinion: "That it is the duty of the Principality to undertake the training and supply of teachers sufficient to meet the requirements of the Principality."

At the third session the chairman, Sir John Gorst, M.P., in his opening speech, confined himself chiefly to compliments to Wales. Mr. Tom John, Vice-President of the National Union of Teachers, discussed "Some Aspects of the Problem of the Training of Elementary Teachers." He held that the pupil-teacher system had come to stay. Suppression was not yet possible, as no scheme of adult teacher-studentship could answer the demand. Certain rules ought to be laid down safeguarding admission into the teaching profession. The county schools and higher elementary schools should have the preparation of the recruits and probationers between the ages of twelve and sixteen. Then these should begin their career as pupil-teachers, and the two years of apprenticeship should be spent in improving the general education and in acquiring some knowledge of the art of teaching in specially selected elementary schools. Teachers should not be admitted to the training colleges unless they gave some evidence of teaching ability: no risks should be taken. The teacher's certificate should

include a University degree, a diploma in theory, history, and practice of teaching, and satisfactory probation. The conditions of a University degree should be modified for teachers. An emphatic warning was given against the practice of binding teachers to serve in a particular locality after the completion of training: there should be absolute free trade in the training of teachers.

Mr. Edgar Jones, Head Master of the Barry County School, outlined the scheme for the training of pupil-teachers which had been at work at that school for six years. The Senior Certificate of the Central Welsh Board was the best for pupil-teachers in Welsh county schools to work for, but attention should, in addition, be paid to such subjects as voice production, blackboard and freehand drawing, &c. Prof. Raymond, Cardiff, while thinking it highly desirable that primary and secondary teachers should, as far as possible, be trained together, pointed out that, until the primary teacher's professional training was separated from his general education, concurrent training was out of the question. Prof. Findlay, Manchester, disapproved of Mr. John's proposal for a teaching degree, which Lord Stanley also characterized as a plan for "having a hall-mark upon the medal without the standard of fineness," lowering the standard of the University degree without ennobling the recipient. Mrs. Mackenzie, Cardiff, made an eloquent plea for the better training of women who teach little children. Mr. A. B. Badger, Director of Higher Education in Monmouthshire, urged that part of the fund raised for higher education should be devoted to the further education and training of uncertificated teachers. Principal Rhys, Oxford, emphasized the necessity of a liberal education for all teachers. Mr. William Jones, M.P., said that Wales had a splendid system of secondary schools, and pupil-teacher centres should be attached to secondary schools. The debate was wound up by Sir John Gorst, who drew special attention to the need of superadding some medical knowledge to the other qualifications of the teachers of young children.

The fourth session was presided over by Mr. A. C. Humphreys-Owen, M.P., Chairman of the Central Welsh Board, and the subject down for discussion was "The Training of Secondary Teachers." Miss E. P. Hughes, sometime Principal of the Cambridge Training College, said that the secondary teachers were concerned with the most difficult and important part of education. Their training should be post-graduate, and special care should be taken to keep out the obviously unfit. Training colleges had been described as the cemeteries of originality and individuality, but she hoped that those of Wales would be so developed that they would be the nurseries of sound

DENT'S MODERN LANGUAGE SERIES.

DENT'S FIRST FRENCH BOOK.

By S. ALGE and WALTER RIPPMMANN. Extra fcap. 8vo, 1s. 6d. net.

* * Since the publication, in November, 1898, of *Dent's First French Book*, ten editions (completing 47,100 copies) have been called for. The further experience gained during the last five years has made it advisable to re-write the book, and it is believed that the new version—*Dent's New First French Book*—represents a distinct step forward in the teaching of modern languages. In order, also, to replace the old wall-pictures, Messrs. Dent have prepared an entirely fresh set for use with the new version of the book. The earlier version of *Dent's First French Book* is still on sale, and should be ordered as *Dent's Old First French Book* to avoid confusion.

Phonetic Part of New First French Book, 6d. net.

DENT'S SECOND FRENCH BOOK.

By S. ALGE and W. RIPPMMANN. Extra fcap. 8vo, 1s. 6d. net.

Fourth Edition.

* * Following the success of *Dent's New First French Book*, authors and publishers felt encouraged to attempt a complete revision of the *Second French Book* also. In the revised version, called *Dent's New Second French Book*, the general scheme is the same as in the old, but there have been many extensive additions. The old version will not be reprinted, and consequently those who order the *Second French Book* will receive the new version, which can be used side by side with the old.

ELEMENTS OF FRENCH PRONUNCIATION AND DICTION. By B. DUMVILLE, B.A. Extra fcap. 8vo, 2s. 6d. net.

educational experiment, research, and enthusiasm. Mr. Trevor Owen, Head-Master of the Swansea Grammar School, also insisted that secondary training should be post-graduate. Training colleges should be attached to Universities, and in Wales there should be a Diploma Board, consisting of representatives of the Central Welsh Board, the University Court, the Welsh County Schools Association, the Assistant Masters and Assistant Mistresses, to supervise the training of secondary teachers. Mr. T. W. Phillips, Newport Intermediate School, gave his experiences of training students in practical teaching while they received instruction in the theory of education at the Cardiff University College, and complained that the very important part of the work of training which was done at the secondary school was not recognized in any way by the University. A vote of thanks to the honorary secretary, Mr. Hammond Robinson, Assistant Inspector of the Central Welsh Board, terminated the proceedings.

SCOTLAND.

On November 29, 1904, Lord Kelvin was installed as Chancellor of Glasgow University. There was a large attendance of graduates and other members of the University, and representatives were present from the other Scottish Universities. The new Chancellor gave a brief and charming address, recalling the condition of the University in his boyhood and indicating the progress that has been made during his lifetime. Honorary degrees were conferred on various persons of distinction, including H.R.H. the Princess Louise, Duchess of Argyll, Admiral Sir J. Dalrymple Hay, Signor Marconi, and the Hon. C. A. Parsons. All the meetings in connexion with the installation were admirably arranged. The programme included a visit to the new chemical laboratories for ordinary study and for research, which have lately been erected at a cost of about £12,000. The outside appearance of the buildings is not beautiful, and much criticism has been expended upon it; but the internal arrangements are so excellent that some one has suggested that laboratories ought to be built inside out. The new buildings are "temporary," i.e., they are intended to be used, say, for twenty or thirty years, and it is hoped that before that time has elapsed the University will have money enough to erect permanent buildings on another site. But the new buildings are thoroughly well equipped, and provide full accommodation for all present needs.

Edinburgh University is about to issue a new appeal for funds for University improvement and expansion. The probable success of the movement may be gauged from the fact that already £15,000 have been subscribed. And, in addition to this, Sir Donald Currie has intimated a subscription of £25,000 for the extension of the teaching staff and for the promotion of research in the University. One is glad to observe the indication afforded by these gifts that the friends of the University realize the necessity of adding considerably to the funds given by the Carnegie Trust if the Universities are to make the progress in all departments which the times require.

The formation of a Local Committee for the Training of Teachers in connexion with Edinburgh University has been postponed by the Scotch Education Department, "pending the result of certain proposals which have been discussed with some of the training college authorities, and which, if realized, would lead to the formation of Committees for the training of teachers on a wider basis and with a more comprehensive scope." This is an indication that the Department expects to be able to carry out the large scheme of reorganization which was mentioned in these notes last month.

Mr. S. S. Laurie, Emeritus Professor of Education in Edinburgh University, has been appointed by the Senatus to be the next Gifford Lecturer in that University. Mr. James Adam, LL.D. Cambridge, is delivering the first course of his Gifford Lectures at Aberdeen. His subject is "The Religious Teachers of Greece."

On December 12 the Jubilee of the Royal Scottish Museum (formerly the Edinburgh Museum of Science and Art) was celebrated by a *conversazione*, given by the Director, Dr. J. J. Dobbie. It was largely attended by representatives of the Universities and of the chief educational and scientific institutions in Scotland.

At the meeting of the Classical Association of Scotland in Edinburgh, Prof. W. R. Hardie read a paper on "The Pronunciation of Latin and Greek." He made the following "definite suggestions":—(1) the difficulty of reading verse was considerably mitigated by reading slowly; (2) teachers should avoid the pedantic attempt to reproduce ancient pronunciation in every detail; (3) we should act upon the knowledge which we doubtless possess; (4) at early stages the reading of verse authors should be cut down in amount, and what is done should be done much more thoroughly; and (5) the practice of learning verse passages by heart might well be more common than it is. Prof. G. G. Ramsay, Harrower, Burnet, and Butcher took part in the discussion, and, on the motion of Prof. Burnet, it was agreed that the

Special Edition, in Three Divisions, each Volume containing a separate Index. Division I., to 1307, 2s.; Division II., 1307 to 1688, 2s.; Division III., 1688 to 1902, 2s. 6d.

NEW EDITION NOW READY.

INORGANIC CHEMISTRY

FOR USE IN SCHOOLS AND COLLEGES.

By W. A. SHENSTONE, F.R.S.

554 pages, crown 8vo, cloth, price 4s. 6d.

The impending changes in the competitions for admission to the Army, and the gradual improvement of the practical exercises set in other competitions, have made it both possible and necessary to introduce more practical exercises of a quantitative kind into this new edition of Mr. Shenstone's book than was thought wise, even by an enthusiast, four years ago.

The New Edition has been so amended, or rather extended, as to provide for the new demands in this direction. But at the same time care has been taken to add what is required, and not to alter. Everything that was in the earlier Edition, with two or three small exceptions, will be found in the present Edition in the same sections and on the same pages as before; so that schemes of school work founded on these earlier editions will be in no way disorganized by the additions now made.

JUST PUBLISHED.

THE "GUIDE"
RURAL CALENDAR.

SECOND EDITION. Revised and much Enlarged.

By **ALFRED J. EWART, D.Sc., Ph.D., F.L.S.,**

Lecturer on Botany in the Birmingham University.

Such a book will be found an indispensable *vade mecum* for country rambles. It gives for each month — **Wild Flowers** which may be expected to come into bloom, with places where they are likely to be found, arranged according to colour, &c., so as to *make recognition easy*. — **Trees and Shrubs**, with particulars of blooming, coming into leaf, &c. — **Birds**: Song Birds, Migrants arriving or departing. List of common birds, building and breeding, with places where nests are built. — **Gardening and Farming Operations**. — There is also a **Complete and Simple Key** to the recognition of the Common Wild Flowers of this country, printed separately from the Monthly Calendar, and an **Index** to all the names in the book. Price 1s. net.

AN ENGLISH HISTORY NOTE BOOK. Second and Revised Edition. By M. A. ROLLESTON (First Class Historical Tripos, 1886), with Introduction by the Rev. T. W. SHARPE, C.B., Principal of Queen's College, London, with Appendices containing Summaries of the Histories of (1) Ireland, (2) Scotland, (3) Wales, (4) Great Britain, (5) India, (6) The Army, (7) The Navy, (8) The Church, (9) The Constitution, (10) Relations of England to France, with Glossary, Index, Bibliography, &c. 3s.

ALGEBRAICAL FACTORS. By H. R. BIRCH. Contains (a) Rules for resolution of Algebraical Expressions into Factors, (b) the application of the Rules to Algebra, Arithmetic, Geometry, and Mensuration. Over 200 carefully selected illustrative Examples *fully worked out*. The Exercises are numerous and well graduated. Miscellaneous Exercises comprising Questions set at various Examinations are also included. 2s. 6d.

THE "GUIDE" NATURE DRAWING CARDS. Set I. **Wild Flowers.** Beautifully coloured copies, and yet simple enough to allow of successful imitation. Sections of Flowers and simple Designs are also given. On the backs of the Cards are Notes on the Flowers by A. J. EWART, D.Sc., which afford a valuable opportunity of correlating Drawing with Nature Study. 2s. per packet net.

THE "GUIDE" SERIES BRUSHWORK DRAWING. Containing 48 beautifully coloured Plates, mainly on Flower Forms, together with minute directions to the teacher on the method of working, the construction of the designs, and the colouring. Price 6s. Published also separately on Cards at 2s. per packet, and in Book form in Outline at 3d. each.

THE "DESIGN" FREEHAND DRAWING SERIES. In Five Sets. Published in three forms, viz., Sheets, Cards, and Books. All beautifully coloured.

Specimens of Drawing Publications sent on request.

J. POOLE & CO.,
 (ESTABLISHED 1854)

104 CHARING CROSS ROAD, LONDON, W.C.
 (Late of 39 Holywell Street, Strand.)

Association should prepare some sort of syllabus of pronunciation for Scotland; not as obligatory but as a guide. Prof. Saintsbury read a most interesting and suggestive paper on "The Literary Teaching of Ancient and Modern Languages," laying stress on the desirability of English being taken late rather than early in a University curriculum. In course of the discussion, Prof. Butcher spoke sensibly on the error of the extreme Herbartians. "Painless methods and the multiplicity of subjects are the bane of education. If you want to get back to any sound principles, you must have subjects which not merely rouse interest, but demand effort. No doubt in this country we have gone rather too far in attaching importance to effort without interest; but in America they have gone too far in making it all interest without effort."

IRELAND.

During the past month the policy of Trinity College in regard to the University question has received definite public expression in several ways. On November 10 a lengthy letter over the signature "Libertas"—which is understood to stand for a Protestant gentleman of considerable importance—appeared in the *Irish Times*, in which the writer advocated making Trinity College a thoroughly national University on secular lines. In the first instance he charged the Board with endangering their independence by their acceptance of £5,000 from Government under the Land Act. He then went on to advocate the removal of the Divinity School, the services of the College chapel, and catechetical instruction, on the assumption that, if the University were made entirely secular, students of all creeds would go to it.

The Provost of Trinity College, Dr. Traill, replied on the 15th to "Libertas," indignantly repudiating the imputation that the acceptance of £5,000 from Government was an Esau's bargain. It had been suggested by himself to save the middlemen on the College estates from ruin. Dr. Traill then pointed out that, instead of feeling themselves bound, after receiving this sum, to accept any policy devised by the Government, every member of the Board, with one exception—no doubt Dr. Mahaffy—and almost the whole body of the Junior Fellows, signed a protest against the Dunraven scheme, and subsequently he himself, a strenuous opponent of the scheme, had been appointed Provost. He then proceeded to point out how futile as a settlement of the Irish University problem, and how injurious to the

interests of the College, would be the removal of the Divinity School. In Ireland no section of the people of any importance desires education to be wholly divorced from religion. The College would suffer the loss of about three hundred students and the injury to all their students by the absence of services and religious instruction without in the slightest degree conciliating the Roman Catholic Church. He pointed out that in no University in the world had the Theological Faculty ever been expelled. In conclusion, Dr. Traill said that everything they could do to make Dublin University a national University they were now doing. The clerical aspect and government of the College are passing away. Of the last six appointments to Fellowships, three have been given to Presbyterians and one to a Roman Catholic. In no part of the teaching or social life of the college would a student receive any injury to his religious belief, whatever it might be. Every prize and post is open to men of all creeds, on the sole condition of their winning fellowship, and it rests with whatever creed is most numerous represented to give the dominant tone to the teaching and life of the College. They were willing to give exactly the same religious institutions within the walls to other denominations as those at present enjoyed by the Protestant Episcopal Church.

From this manifesto it is plain that Trinity College would by a large majority decline anything like the establishment of a Roman Catholic College under Dublin University. At the same time, the authorities are now showing themselves most anxious to meet the needs of the time in every way possible short of this. So completely open to all creeds, indeed, is Trinity College that, had the Church twenty or thirty years ago adopted the policy of sending of their ablest students to Trinity College, while retaining them in residence and religious instruction under their own care, at the present moment the Roman Catholic element might be dominant in the government and teaching of the College.

Amongst recent changes inaugurated by the Board is the establishment of twelve new entrance exhibitions in connexion with the Intermediate Examinations. They will be awarded to successful male and female candidates at the Senior and Middle Grade Examinations on their answering at those examinations, six being of the value of £20 a year for two years, and six of the value of £15 a year for two years. Any successful Intermediate student would thus find himself in Trinity College and provided for for half his course without further effort or pay-

(Continued on page 56.)

The great success that attended the publication of Philips' "Elementary Atlas of Comparative Geography" has induced the Publishers to produce a series of large Schoolroom Maps based upon the same principle.

PHILIPS' COMPARATIVE SERIES

OF Large Schoolroom Maps,

COMBINING PHYSICAL AND POLITICAL GEOGRAPHY.

Physical Features are specially prominent.
Uniformity of Scale and Comparison of Areas.
Political Boundaries are clearly shown.

DR. CORNWELL'S SCHOOL BOOKS.

Edited by **J. CORNWELL ROUND, M.R.C.S.**

With numerous Revisions and Additions by BEN JONSON.

A School Geography. Ninetieth (Memorial) Edition.
With Coloured, Black-and-White, and Star Maps; also numerous
Diagrams. The Reviser has brought this book thoroughly up to date, and it
now contains 384 pages, exclusive of 64 pages of Maps. **3s. 6d.**

"The book is an immense storehouse of accurate geographical information, and a
very suggestive book to the teacher."—*Educational Record*, June, 1904.
"Seeing that it has thirty-six coloured Maps, and nearly twice as many uncoloured,
the price is wonderfully low."—*The Journal of Education*, July, 1904.

Geography for Beginners. Seventieth Edition.

Has been Enlarged and Revised, Maps and Diagrams having been also added.
It now contains 160 pages of interesting matter. **1s.**
"We have tested both these books on many points, and in every case with the
most satisfactory results."—*School Guardian*, May, 1904.

Grammar for Beginners. Ninety-first Edition. **1s.**
Revised, and with additional Section on Analysis of Sentences.

The Young Composer. Forty-ninth Revised En-
larged Edition, contains Sections on the Composition of Sentences, Paragraphs,
Essays, Précis, Letters, Telegrams, and Commercial Documents, also on "Press
Corrections." **1s. 6d.**

"The book is complete and practical."—*School Guardian*, Oct. 1904.
"Altogether the book is a very valuable aid for those who wish to gain the power
to write clearly, accurately, and gracefully."—*School Manager*, October, 1904.

Allen and Cornwell's School Grammar. **1s. 9d.**

London: **SIMPKIN MARSHALL, HAMILTON, KENT, & CO.**

ment on his part. Since this arrangement was announced, an anonymous Dublin gentleman has given £5,000 to enable the Board to extend the scheme further, and is willing to contribute still more liberally to further reforms in the same direction.

Lately also the Board has altered the conditions on which sizarships are held. They are now limited to poor students under nineteen years of age, who have not yet matriculated in T.C.D., and are not graduates of any other University. The Board, in addition, may award sizarships, one in classics and one in mathematics, without examination to junior freshmen who have distinguished themselves since their entrance. They also offer sizarships in experimental science and some mathematics, or experimentals and some classics. A modern language may be substituted for Greek.

The Board have recently announced their scheme for scholarships for women. The Foundation Scholarships are tenable only by men, and their advantages largely consist in residence and commons. The scholarships now established for women have the same subjects (classics, mathematics, and experimentals) as those of the Foundation Scholarships, and the examinations for both will be held at the same time and place. No scholarship will be awarded if the marks won be not at least equal to those of the lowest successful Foundation Scholar in the same subject and the same year. The value of the scholarships will be £30 a year, with exemption from ordinary college fees, except the tuition fees of one guinea a quarter, to which the Foundation Scholars are also liable.

No improvements made by Trinity College, however, can be expected to satisfy the Roman Catholic Church, which demands complete control of the education of Catholic youth and the endowments for that education. At a meeting held in the Mansion House by the Association of Catholic Graduates and Undergraduates, Mr. John Dillon, M.P., sketched a scheme for a Catholic University in which all the difficulties of obtaining a liberal education under clerical control were, as usual, evaded. Prof. Mahaffy was present, and urged Catholic students to take advantage of what Trinity College was giving; while a note of weariness of a hopeless struggle was sounded in similar advice given by the Very Rev. Dr. McDonald, of Maynooth, and in the suggestion elsewhere made by Father Finlay that Catholics should undertake to provide funds for a University for themselves. The difficulties in which the Government are placed are shown by their latest negotiations. After the failure of the Dunraven proposals (mainly through the hostility of Trinity College), the Government entered into a scheme of endowing University College. Stephen's Green, as a teaching college under the Royal University. The Catholic Bishops and Dr. Delany, the Jesuit head of the College, were consulted, and gave their approval. When, however, it was placed before the Cabinet, Lord Londonderry and Mr. Arnold Forster threatened to resign if such a Bill were brought in, and the Government felt compelled to abandon their attempt. One cannot wonder, after their repeatedly experiencing such treatment as this, that Catholic University men, in earnest on the subject, should express strong indignation. This was very marked in a recent meeting of the Catholic Medical School Association. The speakers demanded University endowment as a right, and repudiated any wish for connexion with Trinity College. The Medical School is one of the most successful in Ireland, and has done its excellent work with practically no endowment up to the present.

The Irish Association of Women Graduates, having appealed in vain to the authorities of University College to open the lectures of the Fellows of the Royal University to women students, at the end of October addressed a memorial to the Senate of the Royal University, asking them to give some assistance in removing the disabilities under which the women students suffer. They have lately received a reply that the Senate are unable to interfere with the arrangements of University College. Should a number of Roman Catholic women enter Trinity College, there would probably be a complete change in the treatment they now receive from University College. Already there are some Catholic women students in Trinity College.

Although the opening of Trinity College to women has greatly changed some aspects of the work of Alexandra College, it has so far had no adverse influence on its prosperity. The number of students is exceedingly large this term, and the work undertaken was more extensive than usual. Besides the Hermione Lectures in Art, delivered this year by Mrs. Arthur Strong, on "The Triumphal Sculptures in Roman Art," there have been special courses of lectures in Political Economy by Mr. Jones, Barrington Lecturer in Political Economy; lectures on Sixteenth Century European History, by Mr. Wardle, Professor of Modern History in Trinity College; and lectures on the History of Greek Philosophy, by Miss A. Oldham, B.A. "Students' Day" was celebrated on December 16, when an admir-

**The Journal of Education.
BOUND VOLUME FOR 1904.**

Being the 26th Volume of the New Series. 36th Year of Issue.

"From Mr. William Rice, London, comes the volume (7s. 6d.) containing the collected parts for the past twelve months of that well-known professional monthly, 'The Journal of Education.' It forms a useful record of the scholastic history of the year, and a well-stocked miscellany of reading instructive to instructors."

—*The Scotsman*, Dec. 19, 1904.

"Mr. William Rice has issued the yearly volume of 'The Journal of Education.' Those who know it will hardly require to be told that this 'Monthly Record and Review' gives itself as much scope as is consistent with its special functions. Thus, in the list of articles which it contains, we find 'Athletics' and 'Salaries of Women Teachers,' 'The Teaching of Classics' and 'The Teaching of Modern Languages,' 'The Training of Literary Taste' and 'Conversation in Class.' It may be gathered from these random instances that, as regards the provender—perhaps we should say 'pabulum'—which it supplies, it is about as miscellaneous as the traditional haggis. In its various accounts of the sayings and doings of educationists of all grades it is as full as its space will permit, and tolerably impartial in the bestowal of that space. Perhaps, however, the best thing we can say, or rather quote, in its favour consists of this simple indication on the title-page—'Vol. XXVI.' For an educational journal, that is a 'grande mortalis ævi spatium,' which supplies a stronger recommendation than mere praise could do."—*The Glasgow Herald*, Dec. 15, 1904.

**McDOUGALL'S
NEW LINES.**

McDougall's Laws of Health.

Fully Illustrated. 80 pages. Cloth. Price 6d. net.

TWO NOTABLE REVIEWS.

The Lancet.—"The whole tone of the book is judicious. It is very simply written, and it contains a mass of information that will be useful to all classes of the community. The wide spread of such knowledge will add health and happiness to all homes where it is rightly appreciated. There is a useful Index, and the illustrations are clear."

The Schoolmaster.—"A better treatise on the body and all that pertains to its well-being—concise yet clear, brief yet complete—can scarcely be found elsewhere for sixpence. We congratulate the publishers on their success."

McDougall's Memory Passages.

In Verse and Prose.

A choice and varied Selection. 80 pages. Cloth. Price 6d.

McDougall's Twin Maps.

Each Twin Map contains a **Coloured Political Map** (size 9 in. by 7 in.), and opposite this a **Photo-Relief Map** of the same size. In addition, on the outside cover is printed a summarised **Geography**, clear and comprehensive, of the country. For teaching purposes this combination is quite unequalled. Cloth joint at fold.

Price 1d. each, net. Per gross, 10s. 9d. net.

able performance of "The Rivals" was given by the students before an immense audience.

SCHOOLS.

ABINGDON SCHOOL.—The new Art Room has been furnished and equipped, and was brought into use in December.

BRUTON, SEXEY'S TRADE SCHOOL.—The following scholarships of the Somerset County Council have been gained from this school:—Intermediate (£30 a year for two years): F. V. Harvey (1st), K. R. Lewis (2nd), and F. C. Wyatt (6th); Senior (£60 a year for three years): W. Stokes. H. R. Scott has gained an open Natural Science scholarship at Jesus College, Cambridge.

BUCKS, WYCOMBE ABBEY.—At Oxford, Miss E. G. Romanes, Honours School, Theology, First Class, and Miss J. I. Vernon Harcourt, Diploma in the History, Theory, and Practice of Education. At Cambridge, Miss H. M. Oyler, Modern Languages Tripos, Second Class; Miss K. W. Stills, Historical Tripos, Part I., Second Class. Higher Certificates of the Oxford and Cambridge Joint Board were obtained by nine pupils.

CANTERBURY, KING'S SCHOOL.—Scholarships have been awarded as follows:—Entrance Scholarships: D. H. Cowie (Miss Hardie, Folkestone, and King's School); P. G. E. Chave (Mr. Pearce, Ripley, and King's School); C. F. M. N. Ryan (Mr. Pulling, Kensington Preparatory School); C. J. Galpin (Junior King's School); G. C. W. Harker (Mr. Watson Willis, Eastbourne), for Mathematics; H. Nevill (Rev. R. J. Martin, St. Leonards); C. F. Freeborn (Mr. Jelf, Folkestone, and King's School); J. C. M. Leech (Mr. Faulkner, Purley); H. Parsons (Mr. Olive, Wimbledon, and King's School). House Scholarships: C. M. Sutton (Mr. Pearce, Ripley); W. S. Barroll (Mr. Wallis, Westgate); A. N. I. Lilly (Mr. Watson Willis, Eastbourne).

CHELTENHAM LADIES' COLLEGE.—In the B.A. Examination of the University of London, Dorothy Bond obtained Class I. Classics, Ethel Mary Winnington Ingram Class I. English, Stuart Irene Douglas Class III. Classics, Helen Pughe Whittington Class III. English. We have won for the third time the Sèvres Vase offered annually by the Société des Professeurs de Français en Angleterre. The following pupils have distinguished themselves in the "Grand Concours":—Lily Constance Marx, Gold Medal; Naomi Claire Flecker, Hachette Prize and second prize in Section A; Georgiana Rose Fitzgibbon, Version Prize; and Mary Macgregor has gained the first prize in the "Concours Universitaire." The following have taken the Teachers' Diploma of the University of Cambridge: P. Dumaresque and M. Liddiard, Practice Class I., Theory Class II.; K. Ames, K. de Glanville, A. Hele, E. Neal, E. Hutchinson, Class II.

EAST LONDON TECHNICAL COLLEGE.—The following distinctions have been gained from the College:—Mr. George Boal, London University B.Sc. Mathematical Honours, Second Class; Mr. S. J. Gunningham, London University B.Sc. Physics Honours, First Class; Mr. J. B. Kenner, London University B.Sc. Chemistry Honours, First Class; Mr. E. J. Buckton, Mr. S. G. Winn, and Mr. C. H. Sumner obtained Whitworth Exhibitions. Four King's Prizes were awarded to students of the college, one being in Seventh Stage Mathematics. The following members of the staff have been accepted as recognized teachers of the University of London:—Mr. V. H. Blackman, M.A., Botany; Mr. W. H. White, B.A., B.Sc., Physics; Mr. J. A. Davenport, B.Sc. Vict., Engineering.

LEEDS, CHAPEL ALLERTON GIRLS' HIGH SCHOOL.—This school will be opened this month under new auspices. It was formed four years ago as a branch of the Leeds Girls' High School, the age limit being thirteen years. In future it will be carried on by a company of shareholders under a strong board of local governors. Additional accommodation has been secured, and classes for elder girls are being formed. Miss K. Scotson Clark, who has had charge of the school for some years, has been appointed Head Mistress, and the staff has been strengthened by the appointment of Miss Whittington, B.A. Lond., and Miss Kennett Hayes, First Class Higher N.F.U. (Bedford Kindergarten Training College). Already a considerable increase in the number of pupils has been secured, and special arrangements have been made for the training of kindergarten students.

MARY DATCHELOR TRAINING COLLEGE, CAMBERWELL GROVE.—Four students in the Junior or Academical Division of this college entered for the B.A. Examination at London University in October. All were successful, two gaining First Classes. These students will in January enter the Senior, or Pedagogical, Division, where they will be trained to teach. The division promises to be a large one, and already includes a very considerable proportion of graduates. Miss Carpenter has been recognized as a teacher in Pedagogy by the University of London.

PENARTH COUNTY SCHOOL FOR GIRLS.—The annual distribution of prizes took place on December 8, when the prizes were presented by the Chairman of the Governors. Junior Certificates of the Central Welsh Board were obtained by Gladys Cox, with Distinctions in English Literature and Botany, and by Maud Swenson, with Distinction in English Composition. Senior Certificates were obtained by Ella

"READING WITHOUT TEARS."

THE ATHENÆUM, October 22nd, 1904.—"Paper, type, and arrangement are all good; illustrations abound, and include some attractive pictures in colour. Grammar is not forced on the attention unduly; and, if ever reading is acquired without tears, that endowment should be secured by these little books by Mr. T. Cartwright."

SPECIALY SUITED FOR SCHOOL USE.—Academy and Literature, Nov. 26th, 1904.—"The Children's Scott . . . is quite an attractive volume, with plenty of illustrations and as few notes as possible. It is specially suited for school use, and should surely serve to arouse the children's interest in Scott's works."

LONDON: FRANCIS HODGSON, 89 FARRINGTON STREET, E.C.

"The Boswell of our age."—*The Journal of Education.*

"Even in the matter of talking, if Gladstone is to look for immortality, the *vates sacer* to whom we must go is far less Mr. Morley than Mr. LIONEL TOLLEMACHE, who cannot have spent as many minutes in his company as Mr. Morley spent hours. But in 'Talks with Mr. Gladstone' one sees and hears the talker; here in Mr. Morley's 'Life,' we read him, and it is quite another thing."—*The Guardian.*

WORKS BY THE HON. LIONEL A. TOLLEMACHE,

Author of "Benjamin Jowett: a Personal Memoir." [Fourth Edition. Revised, with Portrait. 3s. 6d. Edward Arnold.]

"Talks with Mr. Gladstone." [Second Edition, Enlarged.]

SEVENTH EDITION. Demy 8vo, pp. 460. With Photogravures of Hon. Lionel A. Tollemache and Hon. Mrs. L. A. Tollemache. Cloth elegant, gilt top, price 7s. 6d.

SAFE STUDIES.

Contents:—HISTORICAL PREDICTION. Sir G. C. LEWIS and LONGEVITY. LITERARY EGOTISM. CHARLES AUSTIN. RECOLLECTIONS of Mr. GROTE and Mr. BABBAGE. Mr. TENNYSON'S SOCIAL PHILOSOPHY. PHYSICAL and MORAL COURAGE. THE UPPER ENGADINE. NOTES and RECOLLECTIONS of Sir CHARLES WHEATSTONE, DEAN STANLEY, and CANON KINGSLEY. THE EPICURIST'S LAMENT. POEMS by B. L. T. (Hon. Mrs. L. A. TOLLEMACHE). INDEX to the CLASSICAL and other QUOTATIONS, with ENGLISH RENDERINGS.

FIFTH EDITION. Demy 8vo, pp. 262, cloth elegant, gilt top, price 3s. 6d.

STONES OF STUMBLING.

Contents:—THE CURE FOR INCURABLES. THE FEAR OF DEATH. FEARLESS DEATHS. DIVINE ECONOMY OF TRUTH.—*Appendices:*—RECOLLECTIONS OF MARK PATTISON. Mr. ROMANES'S CATECHISM. NEOCHRISTIANITY and NEOCATHOLICISM: a Sequel. INDEX to the CLASSICAL and other QUOTATIONS, with ENGLISH RENDERINGS.

These ESSAYS, RECOLLECTIONS, and CAUSERIES, by the HON. LIONEL TOLLEMACHE, were collected in their original form, which, of course, did not contain the Pattison Recollections, at the late Mark Pattison's request. The Books are issued at Cost Price.

LONDON: WILLIAM RICE, 3 BROADWAY, LUDGATE HILL, E.C.

Lloyd Atkinson, with Distinctions in Latin, French (with conversation), German (with conversation); and by Nora Lloyd Atkinson, with Distinctions in Latin, French (with conversation), German (with conversation), English Composition, Arithmetic, and Mathematics. On the results of the Central Welsh Board Examination, N. L. Atkinson was awarded a Glamorgan County Scholarship, amounting to £40 a year for three years, to enable her to go to a University.

ROSSALL SCHOOL.—The following are the principal prizes gained in the school:—Latin Prose (Senior), C. A. Storey; Latin Prose (Junior), A. Pym; Classical Literature, G. S. Woodman; Divinity, W. St. J. Pym. Outside the school the following scholarships have been won:—First Open Classical Scholarship, Clare College, Cambridge, F. W. G. Douglas; Rustat Classical Scholarship, Jesus College, Cambridge, G. S. Woodman; Open Mathematical Scholarship, Caius College, Cambridge, G. G. Woodruff; Open Classical Exhibition, Wadham College, Oxford, W. H. K. Campbell.

SEDBERGH, BALIOL SCHOOL.—The annual entertainment and prize distribution of this school was held on December 3 at the Public Hall, Sedburgh, on which occasion the pupils acted a play arranged by the Principal, entitled "The Land East of the Sun and West of the Moon." The clear enunciation of the actors was a matter of special comment, and a violin solo by M. Longridge was warmly appreciated by the audience. The school has won marked distinctions this year in drawing and music.

WELLINGTON COLLEGE.—The following have been elected to scholarships of £50:—W. H. Croome (from Mr. Gruggen, Wellingborough); H. C. Read, Classical (from Mr. Trollope, St. Albans); A. C. Sykes, Mathematical (from Rev. J. H. Wilkinson, Woodcote). The following have been elected to scholarships of £30:—K. F. P. Mackenzie, Mathematical (Wellington College, formerly from Rev. W. H. Churchill, Broadstairs); G. Cheetham, Mathematical (from Eltham College, Kent); R. M. F. Townsend, Mathematical (from M. Christopherson, Locker's Park); J. L. C. Mercer, Mathematical (from Mr. A. W. Roberts, Langley Place, Slough).

PRIZE COMPETITIONS.

The Translation Prize for December is awarded to "Figaro."

The winner of the Holiday Prize is E. H. Osborn, Esq., 152 Elgin Avenue, W.

The winner of the Translation Prize for October is Miss Ethel M. Prowse, 3 Montpelier Row, Blackheath.

The winner of the Translation Prize for November is E. Trevor Hardman, Esq., Charterhouse, Godalming.

L'eau ronge la côte; de grands morceaux de terre et de pierre, durcis par son choc, lèvent à cinquante pieds du rivage leur échine brune et jaune, usés, fouillés, mordus, déchiquetés, creusés par la vague, semblables à un troupeau de cachalots échoués. Le flot aboie ou beugle dans leurs entrailles minées, dans leurs profondes gueules béantes; puis, quand ils l'ont engouffré, ils le vomissent, en bouillonnent et en écume, contre les hautes vagues luisantes qui viennent éternellement les assaillir. Des coquilles, des cailloux polis, se sont incrustés sur leur tête. Les ajoncs y ont enfoncé leurs tiges patientes et le fouillis de leurs épinés; ce marteau de bourre est seul capable de se coller à leurs flancs et de durer contre la poussière de la mer.

A gauche, une traînée de roches labourées et décharnées s'allonge en promontoire jusqu'à une arcade de grève durcie, que les hautes marées ont ouverte, et d'où la vue par trois côtés plonge sur l'Océan. Sous la bise qui siffle, il se hérise de flots violâtres; les nuages qui passent le marbrent de plaques plus sombres; si loin que le regard se porte, c'est une agitation malade de vagues ternes, entre-croisées et disloquées, sorte de peau mouvante qui tressaille tordue par une fièvre intérieure. De temps en temps une raie d'écume qui les traverse marque un soubresaut plus violent. Cà et là, entre les intervalles des nuages, la lumière découpe quelques champs glauques sur la plaine uniforme; leur éclat fauve, leur couleur malsaine, ajoutent à l'étrangeté et aux mesures de l'horizon. Ces sinistres lueurs changeantes, ces reflets d'étain sur une houle de plomb, ces scories blanches collées aux roches, cet aspect gluant des vagues, donnent l'idée d'un creuset gigantesque dont le métal bouillonne et luit.

By "FIGARO."

The sea is preying upon the coast; fifty feet away from the water's edge great boulders of earth and stone, hardened by the impact of the waves, rise in brown and yellow ridges. They might be a school of whales, stranded in shallow waters, these massive blocks, worn, scarred, defaced, hollowed out by the foraging waves. In their cavernous depths and huge yawning jaws the high tide roars and bellows; engulfed for a moment, it is vomited forth again in masses of froth and foam, to meet the high gleaming billows as they roll up in ever-renewed attack, Incrusted upon the upper surface of these

(Continued on page 62.)

Re-opening of Schools.

THE MEMORY MAP ATLAS AND TEXT-BOOK COMBINED.

NEW EDITION, REVISED AND ENLARGED

UNDER THE DIRECTION OF THE

REV. E. F. M. MCCARTHY, M.A.,

King Edward's School, Birmingham.

Strongly bound in cloth, price 3s. 6d.

Contains a Glossary of Geographical Terms, Directions for Map-Drawing, Seventy-Four Memory Maps and Four Special Maps in Colours, of England and Scotland, Railways and Industries, with letterpress opposite each, forming a complete Text-Book of Geography for teaching purposes, and specially suitable for preparation for all Public Examinations. Adopted in many of the foremost Secondary Schools in the Empire.

EXCELSIOR WALL MAPS.

20 in the Series. 20 Test Maps. Size, 4 feet by 5 feet. 15s. each.

"Absolutely unrivalled."

Reduced Series. Size, 30 by 40 inches. 6s. each.

"The Excelsior Wall Maps are familiar objects on schoolroom walls, as they deserve to be."—MR. WETHEY, M.A.

EXCELSIOR WALL ATLASES.

"In many Schools the very size of Wall Maps is against them. There are, however, in the market several smaller types of Maps to meet their wants, as BACON'S WALL ATLASES. The Wall Atlases, as their name implies, are a series of maps bound together on one roller. Their technical advantage is their handiness: they can be slung over a blackboard, and turned over to the desired map like pictures in a portfolio. Bacon's are beautifully clear and distinct."—MR. WETHEY, M.A., in *School World* for September.

Teachers of Geography should insist on having Bacon's Wall Atlases, which are "Marvels of Cheapness and Utility." Fourteen different parts published, including Plans, and Definitions for Junior Classes, England, Ireland, Scotland, Europe, Asia, Africa, America, British Isles, British Colonies, United States, Palestine, and The World. Special Atlases to suit any scheme of Geography can also be made up of any number of sheets of Bacon's Bold Feature Maps, Reduced Excelsior Maps, and Special Maps (fifty to select from), 30 in. by 40 in.; Mounted on Cloth, and securely riveted together in ornamental covers, with metal band to prevent curling up, at a uniform price of 3s. 6d. per sheet.

 63 LONG ACRE, LONDON, W.C.
 WORKS: GREENWICH ROAD, S.E.

boulders are shells and smooth pebbles. Into the crevices furze bushes have thrust their patient roots and the tangled cluster of their spikes. This coarse rough covering alone can adhere to the rocky sides and resist the spray of the sea.

On the left, a straggling line of rocks, furrowed and gaunt, juts out into the sea, ending in a sand-bank which the action of the high tides has fashioned into the form of an arcade.

From three sides of this bank the eye rests upon the open sea, whose waters are lashed by the whistling north wind into purple-tinted waves; here and there, where drifting clouds cast their shadow, are patches of a deeper hue. As far as eye can travel, stretches the vast expanse of murky waters, swirling and chopping with an uneasy, shivering movement, like a kind of quivering skin, writhing in the agonies of some internal fever. From time to time a trail of foam strikes across the darkness of the waters, bearing witness to a more violent upheaval. Here and there the light shining out between the banks of clouds chequers the monotonous waste with patches of bluish green, whose subdued brightness and sickly hue add to the strangeness of the scene and seem to extend the limits of the horizon. The weird fitful gleams of light, the steely flashes on the heaving leaden waters, the white scum clinging to the rocks, the slimy aspect of the waves, all this calls up the image of some gigantic crucible, filled with seething, glittering metal.

We classify the 155 versions received as follows:—

First Class.—Prestkrage, Nectarine, W.E.G., Gothicus. At spes non fracta, Booboo, Oiseau de passage, Aurora, Threadneedle, M.B., Mikado, M.F.S., A.B.E., Figaro, Menevia, E.M.W., E.H.O., R.J.P., Guennevais.

Second Class.—M.S.X., M.B.L., Chemineau, Orient, Donningtonian, F.F., B.A.F., 24,600, Mew, L.F.K., Denarius, Shakspeare, Birchfield, La Bise, Togo, Sirach, Borealis, Sorbier, Leander, May, Chat-huant, En avant, Sceptic, Cachalot, M.H., A.P.W., Megan, M.A.O., Chingleput, Chota Pagul, H.H., Chevalier, Le Zouave, Taugenichts, Silverpen, Lutetia, Kilver, L. Dennis, Esperanto, M.M.P., Azalea, Altnacaille, Fortes et fideles, Crosne, E.S.T., Primrose, M.W.O., Fanfan la tulipe, Merrybent, Shamrock, Madame Dudevant.

Third Class.—Chita Khan, M.K.M., Great Western, Mare, Brownie, Eryl, Mars, H.C.K., B.G., S.W.T., Shamrock, Marina, S.M.M., Zweena, Stewart, Tête blanche, E.M.M., King Charles, Emilia,

Eleanor K. Bobby, Timber, Marco, Broomstick, Jodrell, Héliotrope, Marie, Devanta, Murphy, Beatrice, C.K., Nephest, Rivested, Eboracensis, Mastodon, Leso, Chestnut, Ardent, Petite, E.A.R., U.H., K.M.J., Vetter aus Bremen, E.A.J.M., Prig, Corklight, Day Dawn, Joan, Crescent, La Printanière, Etudiante, Nec spe nec metu, Cosy, Glynleiros.

Fourth Class.—Watteau Shepherd, Freund, E.M., Ambitueuse, I.C.W., A.J.B., Chose, M. M. Sutherland, Noddinghame, Aubépin, Ela, Eliston, B.T., Young April, Barney, A.T.E., Sly, L.A.T., Nimmer, Mensa.

Fifth Class.—Damis, Newt, M.E.T., Mann, Distel, Twins, N.W., Hero, Caia, Adèle, Sansfeur, Pad, Slowboy, Facies, Prim, Pardie, O.A.O.

Taine's description impresses me rather as a consummate piece of word-painting, an effective stage scene, than as the seascape of an artist with a natural touch—a George Sand or a Ruskin. The main difficulties lay in the choice of the exact words and in their order. Waves, billows, breakers, surge, flood are not synonyms. The majority stumbled at the threshold. *Ronge* expresses continuous action—"is wearing away," not "wears away." *De grands morceaux*, &c.: "Conglomerate masses of earth and rock formed by its action" would be, perhaps, the nearest rendering. *A cinquante pieds*: Numbers mis-translated "fifty feet in height." *De cachalots échoués*: Keep to the end. The description leads up to the simile, and the simile is carried on in *entrailles*, *gueules*. "A school of stranded whales" is quite enough; to define the species "spermaceti" strikes a false note. "The tide booms and bellows in their cavernous maw and wide-gaping jaws." Keep the alliteration and do not weaken *entrailles* to "depths." So, too, *tête*: keep up the metaphor of the stranded mammoths. *Ajoncs*, "reeds"; *lives*, "roots"; *fouillis*, "fall" were not uncommon blunders. "Hardy" does not give the full force of *patientes*; "much enduring" might pass. *Manteau de boure*: "matted covering." *L'Océan* with a capital letter, as "Gothicus" alone pointed out, is the Atlantic. "It is ruffled by the whistling north wind into purplish billows chequered with darker patches by passing clouds." *Une agitation*, &c.: The prize version supplies all needful comment. I should prefer "spasm" to "upheaval." *Ces sinistres*, &c.: Here "the," not "these," is idiomatic English. *Keffets d'éclat*: "Steely flashes" will not stand; "gleam of molten tin on a heaving mass of

THIRD YEAR OF ISSUE.

The Schoolmasters Yearbook and Directory for 1905

IS NOW READY. Price 6s. net.

The Oxford and Cambridge Yearbook.

IN TWO PARTS. 3s. 6d. net each.

Part I.: OXFORD.

Part II.: CAMBRIDGE.

The OXFORD AND CAMBRIDGE YEARBOOK breaks entirely new ground. It contains about 30,000 names, and its aim is to give details of the University degree and honours, as well as the present occupation, of all those now alive who have graduated, or who are entitled to graduate, at either Oxford or Cambridge.

It will be found valuable as an academic register, but it will be more than this. It will be an up-to-date YEARBOOK, and will serve the Universities—as corporate bodies—in much the same way as “Crockford” serves the clergy.

The peculiar interest of this volume is that it will serve as a reference book for the rank and file of University men, whose connexion with the University is not officially kept up, unless they happen to belong to one of the learned professions. It will be a serious attempt to answer the question which is so often asked: “What has become of So-and-so? I have not seen him since I left college.”

For Oxford and Cambridge men it will have a distinct personal interest, but it will also be useful to those who follow the careers of some thousands of those who are filling positions of trust and influence in all quarters of our great Empire.

The Public Schools Yearbook for 1905.

SIXTEENTH YEAR OF ISSUE. 2s. 6d.

Two New Volumes of Sonnenschein's Reference Series.

A DICTIONARY OF BATTLES.

By T. B. HARBOTTLE,
Author of “Dictionary of Quotations” (Classical),
“Dictionary of Historical Allusions,” &c.

Small demy 8vo, 7s. 6d.

FAMOUS SAYINGS AND THEIR AUTHORS.

By E. LATHAM,
Author of “Idiomatic Phrases” (French), &c.

Small demy 8vo, 7s. 6d.

NEW VOLUMES of the PARALLEL GRAMMAR SERIES.

A NEW FIRST FRENCH READER AND WRITER.

By Professor R. J. MORICH. Price 2s.

The publication of the First French Reader and Writer, by Morich and Lyon, will be continued.

AN ADVANCED ENGLISH SYNTAX.

By C. T. ONIONS. 166 pages, 2s. 6d.

“To our thinking, the most attractive and useful volume yet contributed to the Parallel Grammar Series. It has strong claims to a place on the shelves of every teacher of English who really takes an interest in his subject.”—*Guardian*.

ADVANCED FRENCH COMPOSITION.

By H. E. BERTHON and C. T. ONIONS. 144 pages, 2s. 6d.

“We have hitherto seen no work on composition constructed on quite the same lines as the book before us, and we have, therefore, the greater confidence in recommending it as likely to satisfy a want that must frequently have been felt by teachers of advanced French.”—*Guardian*.

READY SHORTLY.

ARITHMETICAL EXAMPLES.

lead" is the best that I can suggest. "Metallic glitter" may pass; but "pewter" is obviously out of court. *Scories*: here "scum," not "slag" or "scoria." *Gluant*: "oily," not "glutinous" or "viscous."

EXTRA PRIZE.

The Prize is divided between "Frederika" and "Chemineau."

There was a large field for this competition, and a book of French idioms and proverbs as good as some that have been published might have been compiled from the 109 lists received. Few of the lists, however, satisfied throughout the condition of "no exact English equivalent." Many gave sentences which, though they are not current in English, admit of a literal translation—thus "Il faut qu'une porte soit ouverte ou fermée." Still more common were phrases for which there is an exact equivalent, though the metaphor is changed: *Il n'a pas inventé la poudre*—"He will not set the Thames on fire"; *A bon chat bon rat*—"A Roland for an Oliver." Others, again, were merely French translations of Latin proverbs: *La fin couronne l'œuvre*; *Qui se ressemble s'assemble*.

A Prize of One Guinea is offered for the nearest English equivalent of the following French phrases. It is permissible, when necessary, to supply a context:—

"Chercher midi à quatorze heures." "Esprit de corps." "L'esprit des autres." "A la guerre comme à la guerre." "Tenir un salon." "Fin de siècle." "Succès d'estime." "Vous m'en direz des nouvelles." "Reculer pour mieux sauter." "Tout comprendre, c'est tout pardonner." "L'âme damnée." "Après cela il faut tirer l'échelle." "Une pièce de résistance." "L'ancien régime." "Un ballon d'essai." "Un cheval de bataille." "Il ne faut jurer de rien." "L'amende honorable." "Rien n'est sacré pour un sapeur." "Qui trop embrasse mal étreint."

A Prize of Two Guineas is offered for the best translation of the following passage from Diderot:—

PORTRAIT DE M. DIDEROT.

Moi. J'aime Michel; mais j'aime encore mieux la vérité. Assez ressemblant; il peut dire à ceux qui ne le reconnaissent pas, comme le jardinier de l'opéra-comique: C'est qu'il ne m'a jamais vu sans

perruque. Très vivant; c'est sa douceur, avec sa vivacité; mais trop jeune, tête trop petite, joli comme une femme, lorgnant, souriant, mignard, faisant le petit bec, la bouche en cœur; rien de la sagesse de couleur du cardinal de Choiseul; et puis un luxe de vêtement à ruiner le pauvre littérateur, si le receveur de la capitation vient à l'imposer sur sa robe de chambre. L'écritoire, les livres, les accessoires aussi bien qu'il est possible, quand on a voulu la couleur brillante, et qu'on veut être harmonieux. Pétillant de près, vigoureux de loin, surtout les chairs. Du reste, de belles mains bien modelées, excepté la gauche, qui n'est pas dessinée. On le voit de face; il a la tête nue; son toupet gris, avec sa mignardise, lui donne l'air d'une vieille coquette qui fait encore l'aimable; la position d'un secrétaire d'Etat, et non d'un philosophe. La fausseté du premier moment a influé sur tout le reste. C'est cette folle de madame Van Loo, qui venait jaser avec lui tandis qu'on le peignait, qui lui a donné cet air-là, et qui a tout gâté. Si elle s'était mise à son clavecin, et qu'elle eût préludé ou chanté:

"Non ha ragione, ingrato,
Un core abbandonato,"

ou quelque autre morceau du même genre, le philosophe sensible eût pris un tout autre caractère; et le portrait s'en serait senti. Ou, mieux encore, il fallait le laisser seul, et l'abandonner à sa rêverie. Alors sa bouche se serait entrouverte, ses regards distraits se seraient portés au loin, le travail de sa tête, fortement occupée, se serait peint sur son visage; et Michel eût fait une belle chose. Mon joli philosophe, vous me serez à jamais un témoignage précieux de l'amitié d'un artiste, excellent artiste, plus excellent homme. Mais que diront mes petits-enfants, lorsqu'ils viendront à comparer mes tristes ouvrages avec ce riant, mignon, efféminé, vieux coquet-là?

Initials or a nom de guerre must be adopted by ALL competitors, but the prize-winners will be required to send real names for publication.

All competitions must reach the Office by January 16th, addressed "Prize Editor," THE JOURNAL OF EDUCATION, 3 Broadway, Ludgate Hill, E.C.

CORRECTIONS AND ADDITIONS TO LIST OF RECOGNIZED SCHOOLS.

Barnet, St. Ronan's S. for Girls, Hadley Wood (Miss Ledward and the Misses Shore).

These School and Teachers' Advertisements are continued from page 10.

SPECIAL CORRESPONDENCE COURSES FOR TEACHERS OF SINGING AND THE PIANOFORTE.

Mr. R. J. PITCHER, Mus. Bac. Dunelm., F.R.C.O., A.R.C.M. Double Diploma as a Teacher of Singing and the Pianoforte. Lessons by Post or personally.—2 Acland Mansions, Willesden Green, N.W.

DANCING, MUSICAL DRILL, and DEPORTMENT.—Trained Teacher attends Schools, in or out of London, for Classes in the above. Private Lessons given at pupil's residence, or at 48 Carleton Road, Tufnell Park, N. For further particulars apply to Miss MARIE CLARK, 48 Carleton Road, Tufnell Park, N.

RESEARCHES.—Literary expert undertakes work in London (British Museum, &c.) and Paris (Bibliothèque Nationale, &c.) for Authors and Publishers. Terms moderate. First-class translator from or into French; Author and compiler. Excellent references. Address—FURTEUR, c/o Mr. W. Rice, 3 Broadway, Ludgate Hill, E.C.

GYMNASTICS, HOOKEY, &c.

THE MISSES M. AND E. HERRING, M.B.C.P.E., M.G.T.I., M.N.S.P.E., Gold and Silver Medalists (successors to Miss SPENCER HARRY), Principals of West Norwood Gymnasium, Knight's Hill, are open to additional Visiting Engagements in London or vicinity.—84 Sandmere Road, Clapham.

DRILLING, GAMES, AND GYMNASTICS.

MISS MARGARET CAMPBELL, Diplômée Member of the British College of Physical Education, Visits Schools and Clubs. Lessons given at private houses. Maypole Dancing a speciality. For terms apply to 84 Steinhold Avenue, Streatham Hill, S.W.

MISS POTTS, pupil of Herr Lutter, of Hannover, and Mr. Fritz Hartvigson, R.A.M., gives Piano Lessons at 61 Victoria Street or Pupils' own residences, or would accept Engagement at a School in the West-end two or three days a week. Address—22 Park Hill, Ealing.

Dancing, Deportment, & Grace Culture.

Miss SUSIE BOYLE

RESUMES her Classes at the PORTMAN ROOMS, BAKER STREET, W.; the ATHENÆUM, CAMDEN ROAD, N.; and the PAVILION, BRIGHTON.

Drawing Room Dancing, Fancy Dancing (a speciality), Skipping, &c.

High Class Schools attended in and out of London.

Brighton visited Thursdays.

Christmas Holiday Classes.

SPECIAL CARE IS GIVEN TO BABY CLASSES. Scotch and Highland Dancing a speciality; also Sailors' Hornpipes and Irish Jigs.

Lessons given in the "Ancient Dances" as recently performed at the Royal Albert Hall Theatre by Miss SUSIE BOYLE and her pupils.

Terms and full particulars on application to
**Miss SUSIE BOYLE, The Nest,
373 Camden Road, London, N.**

EARLY ITALIAN PAINTERS,

ENGLISH GOTHIC ARCHITECTURE.—Mrs. NICHOLLS lectures on the above subjects to Societies, Girls' Schools, and Drawing Room audiences in London and the provinces. Numerous lantern slides. Testimonials and terms on application.—9 Lancaster Road, London, W.

ELOCUTION.—Miss LAURA

SMITHSON, Teacher of Elocution and Dramatic Reciter (centres in various Northern towns), is open to Engagement to deliver her Three LECTURES ON ELOCUTION AND VOICE PRODUCTION. Also to give DRAMATIC RECITALS at Training Colleges, Schools, Literary Institutions, &c. Complete Management of School Plays. Syllabus, repertoire, terms, and vacant dates on application to Miss SMITHSON, Fairfield, Stockton-on-Tees.

LADY and Gentleman, having a House pleasantly situated in country near Cheltenham, will like, in the absence of their own children, to take in Young Ladies who are Bye-Students at Cheltenham College. Highest references given and required.—J., c/o Messrs. Jones & Blakeway, Solicitors, Gloucester.

ELOCUTION.—Miss CELIA

JOSELYNE (Pupil of Miss Elsie Fogerty) teaches Voice Production, Breathing, Reading, and Recitation. Careful attention to Physical Needs and Development. Lectures and conducts Classes in Schools. Brighton Classes on Thursdays. Excellent testimonials. Terms moderate—42 Undercliff Road, Lewisham, S.E.

LECTURES ON WATTS,

BURNE-JONES, THE PRE-RAPHAELITES, and some aspects of Contemporary Art, fully illustrated. Miss C. F. SEVERN BURROW, Medalist and Exhibitor at the R.A. and other Exhibitions, gives Courses and Single Lectures at Schools or Clubs. For prospectuses, terms, &c., apply—St. James's, Great Malvern.

COACHING for the Royal Drawing

Society's Teacher-Artist Certificate given by Miss C. F. SEVERN BURROW, Medalist, Exhibitor at the R.A. and other Exhibitions, and fully qualified Teacher, at her Studio in Malvern and also by Correspondence. "Life" work, Memory Drawing, and Teaching practice are necessary for this Certificate. Address—St. James's, Great Malvern.

THE BRITISH COLLEGE OF PHYSICAL EDUCATION,

5 and 7 Johnson Street, Notting Hill Gate, London, W.

(Founded 1891. Incorporated 1897.)

For particulars of the Examinations for Membership, Licentiatehip, or the School Teacher's Certificate, apply to

[Just ready.

GEORGE G. HARRAP, 15 York St., Covent Garden, London.

THE GREEK QUESTION.

A DEFENCE of compulsory Greek at Oxford and Cambridge (not, as we read the oracle, "via prima salutis" comes to us from a quarter whence we should least expect it—from the Teachers' Guild, the most catholic and democratic of our educational corporations. In the December number of the *Teachers' Guild Quarterly* the question is argued from first principles, and it is refreshing to be raised above the dust and din of the Senate House and the paper war of fly-sheets and to contemplate the fray from the serene temples of the philosophers.

The writer takes as his major premiss J. H. Newman's definition of a University: its true function is "to give a knowledge which is its own end." The minor premiss, which follows logically, is that a University should recognize as a condition for admission proficiency in those studies which promote general culture and have no definite reference to any particular future career. It should do nothing to encourage "the inroads of specialization on the sacred years which, by almost universal consent, should be dedicated to purely general education." Lastly, the writer holds that, while specialization is the bane of schools, the Universities should themselves specialize. "One University should be strong in certain Faculties and another in others." Let Oxford and Cambridge be the nurseries of Arts, and let "Arts" return to their original meaning without straining it to cover sciences. Leave modern subjects, physical sciences, including, if needs be, those which are technological in character, to the modern Universities—to London and Birmingham and Leeds. Excuse Science men from Greek, and we shall produce what Mr. Bryce calls "a hard, gritty, and infertile type of mind."

Such, in brief, is the argument which, at the first blush, as a protest against the banal spirit of modern utilitarianism and a plea for the disinterested pursuit of knowledge, is singularly attractive. But a little reflection will show us not only that it presents a single aspect of a many-sided problem, and affords us little aid towards its solution, but that Cardinal Newman's ideal University with its single Faculty is ecclesiastical, mediæval, and unprogressive.

Let us set against Newman's definition that of Mark Pattison—like Newman, a son of Oxford and a humanist: "A University is the organ of the intellectual life of a nation; it is the school of learning, the nursery of the liberal arts, the academy of the sciences, the home of letters, the retreat of the studious and the contemplative." A University is a living body, a complex result of life; it must take all knowledge for its province; it must be not only a school but a laboratory, and, if it cuts itself off from any branch of science, it deprives itself of a vital organ and is doomed to sterility and ultimate decay. The humanist must rub shoulders with the man of science if he is to escape from narrow pedantry, just as the man of science must drink of the humanities if he is to avoid the "hard, gritty, and infertile type of mind."

To descend from these generalities to the problem before us. In the protest against premature specialization we most heartily concur; but, as it seems to us, compulsory Greek is an insistence on specialization in its most aggravated form. Let us concede that "the humanities are an essential—nay, the prime—element in a purely general education," and let us make, for the sake of argument, the larger concession that Latin and Greek are an essential factor of the humanities. The *Quarterly* writer, in his turn, will hardly dispute that the mother tongue is a no less essential factor, and, further, that a well educated youth of eighteen or nineteen may fairly be expected to know something of mathematics, of science, of history and geography, and of French or German. If, as the writer desires, the University is to "assert its claim to control the education of its future alumni in its earlier stages," it is bound in its preliminary examination to insist on a competent knowledge of all these subjects. It is needless to point out that as matters stand there is not even a pretence on the part of Oxford and Cambridge of realizing this ideal. Half of the above named essential subjects (and our list is not exhaustive) are not examined in at all, and in the obligatory subjects the examination is not always framed to test real knowledge. Thus "mathematics" at Oxford means learning two books of Euclid by heart, and "Greek" both at Oxford and at Cambridge, means a smattering of Greek

accidence and getting up a couple of Greek plays. Nor, as far as we are aware, has any reformer been bold enough to propose that the Universities should "tune" the schools by insisting that every student before entering should pass in the rudiments of our modern *trivium* and *quadrivium*. This was indeed the express aim of George Grote and the founders of the University of London, though it was even then felt that Greek could not be enforced; but the scheme of universal knowledge failed to produce the results anticipated, and in the Matriculation Examination of the reformed University it has been frankly abandoned in favour of a scheme with manifold alternatives.

This seems to us the root of the whole matter. As knowledge grows and ramifies it becomes less and less possible for any man to be an encyclopædist, or for any pupil to acquire the rudiments even of the main branches. Even at school there must be, not indeed specialization in the narrower sense of the word, but what we should prefer to call differentiation. All children, whether in primary or secondary schools, must start with a common basis, and we fully agree that the humanities should be the corner-stone of the edifice. The longer this common course can be pursued the better, but there comes an age when the pupil (quite irrespectively of his future calling) must make his choice between the classical and the modern side. Before that age (say, fifteen) all educators would agree that it is not advisable that he should study Greek. After that age, if he joins the modern side, there is, at least among modern-side masters, a consensus of opinion that the Greek he learns to satisfy the requirements of the University profits him nothing at the time and leaves no trace behind it. If we wish our Universities to be recruited from the modern no less than from the classical side, we shall remove this barrier. The argument that it keeps no one out; that the mathematician or science man can take it in his stride, proves too much: it admits that Little-Go Greek is a piece of stage machinery. The one serious plea for its retention, when stripped of its rhetoric, amounts to this: the many must be compelled to learn sham Greek in order to secure for the few an opportunity of really learning Greek. It is an argument that will not find much favour in a democratic age. The advocates of Greek who warn us that Greek is doomed to extinction unless it is bolstered up by a preferential tariff show a singular lack of faith. We believe that Greek is strong enough to stand on its own merits, and that it will actually gain by losing the mob of conscripts pressed unwillingly into its service, who desert as soon as they have learnt the goose-step.

"We hold that the main value of Greek, and, in a lesser degree, of Latin, lies in the power that they give us to penetrate into an atmosphere altogether alien from our own."—If this be so, if a knowledge of Greek thought and literature—not of the language—be the *signum stantis aut cadentis universalitatis*, it is surely irrational to impose a test in grammar and entirely ignore the literature, the history, the art of Greece. Would not the freshman who takes up Jowett's "Republic" of Plato, Whitelaw's translation of Sophocles, Curtius's "History," and Lessing's "Laocöon" have penetrated further into the Greek atmosphere than one who has only mastered Abbott's "Greek Accidence"? The letter killeth; the spirit giveth life. Greek, say our opponents, will, if your alternatives are admitted, in a generation or two be relegated to the same rank that Hebrew occupies to-day. We do not for a moment believe it; but, even were it so, we would ask them whether Hebrew scholarship has suffered, whether Hebrew literature is less studied to-day than it was a hundred years ago, whether Hebraism is a less potent factor in the religious life of the nation.

But we would go further. We began by admitting that Greek was an integral factor of humanistic culture, but, if this is interpreted as meaning that no man can be said to be fully educated without a knowledge of the Greek language, we absolutely deny the assumption. It would be easy to compile a list of highly educated men, from Shakespeare and Bacon down to Keats and Darwin, who had small Greek or none; but these might be written off as exceptional geniuses. Our refutation rests on a broader basis. We are heirs of all the ages, and the spirit of Greece has passed into modern European literature. Is it too much to say that, apart from direct translations and imitations, the student who has read and digested Racine, La Fontaine, and Molière; Pascal, Montaigne, and Courier; Goethe, Schiller, and Lessing; Jeremy Taylor, Burke, and

Landor; Milton, Wordsworth, Keats, and M. Arnold will have absorbed a large portion of the Greek spirit? Much, but by no means the whole, we are the first to admit. On the other hand, we must refuse to call him a fully educated man to whom the vast literatures of France, Germany, and Italy—their poetry, their science, and their *belles lettres*—are books with seven seals; who know nothing of "Le Misanthrope" and "Les Misérables," of "Faust" and "Wallenstein," of the "De-cameron" and the "Divina Commedia."

The Greeks knew no language but their own, and looked on all who could not talk Greek as outer barbarians. But this, like slavery, was an accident of time and circumstances, not an essential of the Greek spirit—which we all, whether classicists or moderns, are jealous to preserve. Could we call "the Master of those who knew" from the shades, there is little doubt how he would vote on "the Greek Question."

EPEA PTEROENTA.

FROM DEBATE IN CAMBRIDGE SENATE, DEC. 1 AND 2.

THE PRESIDENT OF QUEENS'.—For students of science the retention of the examination of Greek had become artificial, unreal, and therefore burdensome.

The solution of the problem lay in the institution of a new degree or new degrees.

SIR R. JEBB.—Head masters in the proportion of 8 to 3 held that the exemption of all candidates from Greek would endanger or extinguish the study of Greek in the vast majority of schools. At the present moment the great impediment to maintaining a high standard of liberal education was premature specialization in scientific and technical subjects. The proposed changes would be all in favour of premature specialization.

The report was advocated in the name of light. To him it seemed to savour of obscurantism. If Cambridge once banished Greek, there could be no hope of a second Renaissance.

THE MASTER OF PETERHOUSE (Dr. Ward).—The study of Greek possessed an inherent vitality in itself which was guaranteed by its universal recognition as an unequalled instrument of culture. It flourished at Cambridge before the institution of the Classical Tripos and the Preliminary Examination, 1822-4, when for the first time Greek was made a compulsory subject for all candidates; it continued to hold its own after an endless series of new Triposes had been instituted.

There was no fear of the true study of Greek suffering in the large public schools or in the smaller schools into whose system it properly fell. Was it the intention of the University to galvanize it in those schools in which it had no organic place?

As to the substitution of French and German, he confidently believed in its educational efficiency as well as its public utility. These languages could be taught—and, in a steadily increasing number of schools, were taught—in such a way as to furnish linguistic training not inferior to Latin or Greek.

Prof. MAYOR thought it a pity that a few months before the hundredth year after Paley's death the University should "dismiss him with a flea in his ear."

As for French and German, he thought that they should teach them to themselves. He himself was never taught a living language, except Cingalese.

Dr. Gow would retain compulsory Greek because it furnished the grammar-school master with an answer to Philistine parents. He could point to the examination and say "Greek pays."

To make a subject optional meant painless extinction. The Army Council had made Latin optional for Woolwich and Sandhurst. As a consequence, the Army classes at Rugby, Clifton, &c., had dropped Latin. In the London Matriculation sixteen years ago one language had been knocked off, and German went to the wall. Two years ago Latin was made optional, and Latin was slowly dying.

The classical side was absolutely essential to the welfare of our schools, for Greek was the badge of good work and good influence. His classical side at Nottingham (forty boys out of four hundred) had an influence far out of proportion to its numbers. It consisted of the better-bred boys. If the classical side disappeared, the school would become much more of a mob.

THE MASTER OF TRINITY (Dr. Butler) pleaded the cause of the Passman. If, in addition to the indispensable subjects of a school curriculum, the University insisted on two ancient languages, it was placing upon these boys a burden beyond what many of them could bear. Thirty-five years ago he had authorized Mr. E. Bowen to institute a modern side at Harrow from which not Latin, but Greek, was ex-

cluded. If he had to go over that experiment again, he should do the same.

His own contention was that the effect of Greek training upon the intellectual standard of the lower boys was almost *nil*, while it robbed them of a vast amount of valuable time.

Dr. ALLBUTT.—The present system of compulsion had failed completely to realize its object. He often appealed to his men, and said: "You have been eight or ten years learning Latin, and I know from what I see that you cannot put ten words of Latin together without making four or five grotesque mistakes." They would admit: "We cannot put the words of Latin together without considerable liability to error; we could not put five words of Greek together at all."

Dr. WESTLAKE.—Let them learn what a boy was, and in ninety-nine cases out of a hundred they would be able to make something of him. Under the present system, they did not turn out the boy what he should be, nor could they, unless their studies were made freer, unless they gave up the attempt to force square boys and men into round holes and round ones into square holes.

Dr. MCCLURE.—Boys who took up Greek merely for the purpose of entrance into Cambridge had a serious wrong done them. To make boys take up Greek for six, eight, or twelve months, merely to cram it for an examination, was to bring to scorn that glorious language, bring into contempt a glorious University, and, what was worse, to give the boy a very low ideal of scholarship and learning. It was a most serious moral wrong.

He doubted if those who were not practically engaged in the teaching of schools knew what enormous progress had been made of late years in the teaching of French and German. The teaching of those languages, as conducted in many schools with which he was acquainted, gave a mental and moral discipline to the ordinary boy in no way inferior to that which in times past was produced by the study of the classical languages.

Dr. MAYO.—Those things which Dr. Ward had called studies were not studies at all. A knowledge of French was not a necessity, and all could pick it up at any time.

The MASTER OF PEMBROKE.—A man could not get through life as an educated man without learning French, and could not become really a student of the higher knowledge in any subject without knowing German. Therefore, if they made French and German his school subjects, they were really depriving him of Greek without giving him anything in exchange. A better substitute for Greek and Latin would be Arabic or Hindostanee.

Prof. RIDGEWAY.—What they were fighting was not the cause of Greek or Latin, but the cause of literary education as a whole, and they were not fighting it against the higher scientific side at all, but against the scientific nonentities and the commercial scientists. What did the public know about it? Was the brain going to lead or the tail?

How did this bugbear of the outside public arise? He would tell them. The University wanted money. The millionaires were being hunted down in all directions, but the woodcocks would not be caught in their springs. They were told that they would not do anything for Cambridge so long as it was regarded as a monkish place, full of dead languages, and so forth. Did they believe that if they turned the University of Cambridge inside out such men would give them anything? They stood no more chance than of getting money from the Corporation of Cambridge. But because of these things they had the Syndicate setting down the regulations of all the mushroom Universities to show them what they ought to do.

Mr. BARBER.—At the Leys School more boys were sent to the University from the modern than from the classical side. This was a real grievance. For the last and most important year of school life the modern-side boy had to learn a subject which he could not profitably learn to any advantage in the time, and which he would be bound by-and-by to cast aside. This was a cause of mental and moral irritation.

With reference to Dr. Gow's depreciation of modern sides, he would like to say that at the Leys School it was possible on the modern side to get an education morally and mentally as effective for good as that which could be got from the classical side.

Dr. ROUSE.—If the Government, as it ought to have done, had arranged a systematic education suited to the needs of the country, and had provided that it should be carried out in every commercial or secondary school, then there would have been no objection to considering this question. As it was, the University had no right to abolish compulsory Greek, especially as the Syndicate had taken no pains to ascertain the facts of the case.

Dr. MAITLAND knew a boy at school [Eton], some forty years ago, who was taught Greek for eight years and never learnt it; but one thing he did learn—to hate Greek, its alphabet and its accents, its accident and its syntax, and all its appurtenances, and to long for the day when he would be allowed to learn something else.

So you have got to learn Greek grammar, not because you are going

to enjoy Plato or Sophocles or Aristophanes—don't you think it, my son; such delights are not for the like of you—but "because the bulk of the Passmen in our old Universities are being educated on humanist lines." Humanism? Was there no other word to apply to the General Examination for the ordinary B.A. degree? It took a conference of head masters to make that joke. Upon his word and honour, if there was going to be much more talk about humanism he should think they had need of a new degree—Bachelor of Humanities: to be abbreviated as Hum.B.

But he could sympathize with the cry of the craftsmen who made the silver shrines. Diana was quite as good a goddess as another, and when it was said: "I am a gentleman; I learnt my verbs in -*mu*, and therefore people who do not learn their verbs in -*mu* belong to the lower middle classes," though he did not think it was exactly humanism, it was intelligible human nature. He could sympathize with Dr. Gow. Hitherto he had had his official answer cut and dried for the parent who wanted to know why his little boy was to learn Greek—"because the Universities require it." "That," said Dr. Gow, "was my great stand-by." Well, it was a very unpleasant thing to be deprived of your official answer; it was like a man who on losing his spectacles felt quite naked and ashamed.

Sir GEORGE YOUNG, as a Charity Commissioner, pointed out a fact that had been lost sight of in the debate. Under the Endowed Schools Act, in accordance with the recommendations of the Taunton Commission, Greek was excluded from the regular curriculum of the second-grade schools of England generally, and from the curriculum of the less well endowed schools and those with lower fees entirely. Not even Sir W. Anson had reversed that policy. From those schools they had received many of those who were the chief glory of the history of the University of Cambridge. By insisting on Greek they would not, indeed, absolutely exclude, but they would put a formidable barrier to the entrance of, the Newtons, Wordsworths, and Whewells of the future.

Mr. SOMERVILLE.—Dr. Gow was mistaken about the Latin of Army candidates. The Army class at Eton averaged a hundred. These boys always had learnt Latin, and would continue to do so.

As a schoolmaster he had seen far too many instances of boys condemned to intellectual sterility by compulsory Greek.

Dr. BARNES.—They should dismiss from their ideal Previous Examination subjects that were merely useful, such as the French language. The only language which came anywhere near Greek as an educational instrument was Arabic; but he should not propose Arabic as an alternative—it would not suit the Schools.

Mr. SAUNDERSON (Oundle) had come across no instance of Dr. Gow's utilitarian parent. When they sent their boys to Oundle parents said to him: "Take the boy and find out what he is capable of doing." They wanted the boy to enjoy his school work. That was the way in which their modern sides ought to be fed.

No more cruel thing could possibly be done than to sacrifice the dull boy for the sake of the intellectual boy. If they came to the conclusion that the majority of boys in school ought not to learn Greek, it was cruel that a select number of intellectual boys should be taught Greek at the expense of the so called dull boy, and that while at school they should live upon the dull boy.

Dr. BREUL denied that French and German were intended to be "soft options." A language that had produced the works of Luther and Lessing, of Goethe and Schiller, of Humboldt and Mommsen, could not be "picked up" by a few weeks' stay abroad or learned mechanically from the lips of a nursery governess.

Mr. MILNER BARRY.—Dr. Chawner had called attention to the flourishing condition of German *Gymnasien*; that was equally true of *Realgymnasien*, which taught Latin and one other language, and of *Realschulen*, which taught two modern and no classical languages. Any boys from any of these different types of schools could proceed to the Universities without let or hindrance. In Germany classical studies had not suffered by the concession of options.

The MASTER OF CHRIST'S (Dr. Peile).—It was possible to get in French, and to some extent in German, to what he might call the subject-matter, from the greater facility of the grammar. That was precisely what their pupils in Greek did not seem to do. They did not get to the literature, to the real knowledge of the language, at all.

He had never heard an answer to the statement that in the case of boys who had little taste for languages, so far as linguistic training was concerned, there was an appreciable gain in adding one ancient language to the other. And it was nothing more than linguistic knowledge that they got, to a limited extent, by means of Greek, into the brains of their non-classical men.

They had a statement from the Chancellor (the Duke of Devonshire) that, after talking with many men in all parts of the country, he found the prevalent opinion that at Cambridge they were devoted by bygone ideals, and that they would not budge one atom to meet the educational ideas of the day. He firmly believed that, if they at Cambridge hardened their hearts and stiffened their necks, and refused to make any change,

they would alienate from themselves the most progressive and the most actively minded parts of the nation.

Mr. GILES denounced the Charity Commission as obscurantists—"a rascally Commission doing anything in their power to prevent poor boys having the opportunity of a liberal education."

The PROVOST OF KING'S (Mr. Austen-Leigh).—The Report dealt only with the Previous Examination. It made Greek optional in that examination. The result was that all candidates for Honours could, if they pleased, avoid taking Greek. That did not set free the Pollmen.

As far as the University was concerned, Greek had only been compulsory since 1822.

Why was a linguistic study necessary for all students? His answer was, because it taught boys to think accurately and to express themselves clearly. The latter object might be attained by the study of any modern language; for the former an ancient language was superior. It did not follow that two ancient languages were necessary.

Mr. BATESON.—It was common knowledge that the partial endowment of a great technical school was offered to Cambridge privately, and that the benefactor, feeling his way in the matter, found that Greek was demanded, and the technical school was not coming, frightened away by Greek. That cuckoo's egg would be laid in another nest.

The real substitute for Greek, and the only worthy substitute, was science. French and German were on too low a plane to reach the level that they required.

Dr. H. JACKSON.—He had been a teacher of Greek in the University for more than forty years, and for the last four-and-twenty had been studying and teaching Greek and nothing else. He thought the subject worthy of any one man's life work. Of all literary instruments of education, he believed Greek to be the best—for the right people; for the wrong it was the very worst. As Mr. A. Sidgwick wrote, when a master at Rugby: "For the worst boys who do Greek at a public school it is not merely useless, but pernicious."

Mr. GLOVER.—Greek seemed to him as safe as the stellar system or Shakespeare, and, whatever they did, Greek was going to hold its own.

THE GREAT GREEK QUESTION.

(FROM A CAMBRIDGE CORRESPONDENT.)

IF Cambridge were in France, we should all be wild over *L'affaire Little-go*. All the elements for an *affaire* are there. The mysterious letter from the Chancellor, the Duke of Devonshire, which no one quotes, but which the Council of the Senate have seen, and sworn not to divulge; the remarks of the Chancellor in the combination room of Trinity; and the anonymous benefactor who came with a technical school in his pocket, who was bowed from one University office to another, and went away with his school still in his pocket—these are the elements of the *affaire* that keep us perplexed and wondering as to what it all means. What have these mysteries to do with the Little-go—or with Greek in it? Somebody said, we are told, in private, or wrote in a letter "not for publication," or implied, that certain other people hinted "that we were so devoted to bygone ideals that we would not move to meet the educational ideas of the day," and that therefore they could not—and there the sentence leaves off, and some guess one thing and some another.

So a Syndicate—which is the Cambridge equivalent of a Royal Commission—is appointed to discuss our educational methods. The Opposition, who failed to stop its appointment, at once began to gather the names of those who were willing, before it reported at all, to say they would vote against anything it might report that was likely to touch Greek. The Syndicate met, heard evidence, shed a few of its members, and reported.

The main features of the scheme were (1) the dismissal of Paley (for whom no one now has a friendly word to say, except Prof. Mayor); (2) the grouping of the four languages Greek, Latin, French, and German together to be Part I. of a new Little-go, with the explanation that one classical language must be taken, and either both papers in any of the other three languages, or one each of French and German; and (3) the final abolition of set books. It has been for some time permissible for a candidate to do some hard unseen translation instead of a book; now it is proposed that he shall not have this option, but shall do unseen, prose, and grammar.

When an interval had been given us to digest the Report and its proposals and its appendices many and various, a "discussion" was announced for Thursday, December 1. In Cambridge, it should be said, we always legislate so. A report is issued, is discussed after an interval, and after another interval it is voted on. Thus discussion is academic; the voting is another thing and at another time. In this

case we shall vote next term. Meanwhile we have discussed the great Report for three days in the Senate House and had hours and hours of oratory, rhetoric, discussion, likes and dislikes, platitudes, ideals, and mere talk.

The two salient points were the changes by which Greek ceases to be compulsory and the set books totally disappear. The former had most attention, friendly and hostile. For the latter, virtually no defence was made, except that books are often badly done, that the new scheme will be "harder," and that we must be thorough. The opponents of optional Greek will gain votes here when the day for voting comes, as there was clearly a middle party in the Senate House, distinct from the "root and branch" friends and foes of the present Report. The middle party approve optional Greek and disapprove pure unseens, and it is likely that some of them will either abstain from voting or vote *non placet*, unless material changes are made in the scheme.

As to optional Greek, *per se*, we all said our say—panegyricized Greek and Humanism and people who can pronounce Bootes (without the help of dots), or pled for Liberalism and recognizing facts. Probably neither side gained adherents from its opponents on the Greek question. Too many superlatives were used by the champions of Greek in eulogizing it, while the supporters of the option were, generally speaking, heavy or even slightly Philistine. Neither side showed much intelligence of its opponents' position, and the great guns missed fire a good deal in consequence. Prof. Maitland for the option, and Mr. Bateson against it, were certainly the most interesting speakers in the debate.

We were all glad when the debate was over—except perhaps the members of the Syndicate, to whom the Report has probably been referred back. What they will do with it, whether they will temper it to retain the Middle Party's support and so weaken the Opposition, no one can tell. In any case, there is great probability that the whole Report will be thrown out. Outsiders do not know how much support the Opposition found for their preliminary *non possumus*, but it is quite likely that the Master of Pembroke, who, by the way, was peculiarly rude to Dr. Maclure, has, in virtue of the *odium theologicum* which underlay his rudeness, enlisted unknown numbers of country clergy to follow him. He has raised the cry of "Church in danger!"—and the clerical vote is large, if it is nothing else.

MODERNS V. ANCIENTS FROM A GERMAN POINT OF VIEW.

A RECENT number of *Die Woche* contains an interesting article by Geh. Regierungs-Rat Dr. Paul Güssfeldt on "Modern Languages as a Mental Discipline." After pointing out the distinction between these and the dead languages, the latter being a compact whole, capable of no accession or increase, while the former is like a stream, ever flowing and gaining strength in its course, he continues:

The language of a people which has attained a high degree of civilization cannot fail to be a subject of the utmost interest to every educated person, and to appear to the unprejudiced thinker a salutary branch of education.

He then propounds the much discussed question:

Is it correct to say that only in the Greek and Latin tongues is the power inherent of stimulating the understanding for higher educational purposes, that Greek alone enables us to appreciate what is beautiful in art, and that a command of the Latin tongue, bringing in its train an intimate knowledge of Roman history and statecraft, can alone contribute to promote a complete understanding and furtherance of modern civilization?

After admitting that no school, even those where classics are not taught (in Germany called *die lateinlosen*), is uninfluenced by the spirit of classical antiquity, he proceeds:

When, however, it becomes a question as to the influence of modern languages in developing our tastes and love of the beautiful, the following facts must not be overlooked:—only exceptional students are, by reading and study, capable of thoroughly grasping the spirit of the Greek tongue. After leaving school, Greek, unless pursued as a special study, is consigned to oblivion from lack of further cultivation. The costly treasure is buried, when it should expand to a luxuriant growth. With Latin it is somewhat different; though not wholly confined to the domain of students of classical philology, its use is in a state of gradual decline. In German Universities, for example, Latin dissertations are slowly and surely giving place to those in the native language.

If, however, in the place of these two classical languages, French and English [we may here substitute French and German] form a

subject of instruction, the student at once enters upon another path of intellectual training. Whether this training is thereby less powerfully developed than it would have been in a classical school [*anglice*, on the classical side] depends in a great measure upon the student's particular bent.

In discussing the advantages of French and English as subjects of the school curriculum, Prof. Güssfeldt, in the former case, lays special stress, as regards mental discipline, on the conjugation of the verbs and their "wealth of forms," the correct reproduction of the vowels and nasal sounds, and the uses of the moods and tenses; further—and this applies to other languages as well—that of being spoken by millions of educated persons, whereby is engendered in the learner a healthy striving to express himself accurately and fluently.

To attain this proficiency a mental exercise, absent from the study of the dead languages, is opened up to him.

It would be out of place here to dwell upon the benefits accruing from a study of English, to which the Professor attaches the utmost importance from an intellectual as well as a utilitarian point of view. Much of what he says applies with equal force to German, and, though perhaps we cannot go so far as he does in respect of English, as to say that we owe to the German Parliament speeches worthy of a place beside those of Demosthenes and Cicero, or that with "ein paar hundert Vokabeln" we can get on wherever German is spoken, yet we may confidently assert that, for its power of word-combination, its rhythm, its conciseness of expression, its construction, "einzig in ihrer Art," not to mention its interesting history and philology, it is a valuable factor in the development of the intellectual faculties.

It is obvious [he proceeds] that the influence on the youthful student of the literature of two civilized nations, with whose language he becomes more familiar from day to day, cannot but have a beneficial effect on his future life.

In these days, when a mixture of fanatical patriotism and commercial "internationalism" completely clouds our judgment of ourselves and other nations, a drop, however small, of the oil of much despised cosmopolitanism will tend to purify the whole. A cosmopolitan is not a detractor of his country; he knows perhaps better than others that the foundations of his strength are implanted in his native soil; but other men are as much God's creatures as he is; as a cosmopolitan it is his duty to recognize what is good among foreign nations, and as a patriot to introduce it into his own.

In this respect instruction in modern languages will accomplish much that is denied to the classical tongues.

Prof. Güssfeldt is not, however, prejudiced. He does not advocate the cultivation of spoken languages to the exclusion of the dead ones. On the contrary, the conclusion he arrives at is this: the abolition of the classical *Gymnasium* would be as great a misfortune as to hinder the erection of those where French and English alone are taught; and, just as Roman and Gothic architecture are found side by side, and often, indeed, in combination, so it should be with the ancient and modern tongues. There is room for both; neither should exclude the other.

H. S. B. W.

THE ORIGIN OF WESTMINSTER SCHOOL.

THE recurrence of the Westminster Play, which still draws "crowded houses" to Westminster School under Dr. Gow in the days of King Edward VII., as it did under Dr. Busby in the days of King Charles II. or under Dr. Nowell in the days of King Edward VI., furnishes an occasion for placing on its proper basis the history of that famous school. The history of none of our great public schools has been more obscured, through the inventions of the fifteenth and the guesses of the seventeenth century having been accepted as gospel in the nineteenth century.

The life of Ingulf, Abbot of Croyland, has been cited to give Westminster a Saxon lineage, under the patronage of Queen Edith, the wife of King Edward the Confessor and sister of King Harold. Ingulf is made to say:

I saw her often as a boy when I visited my father at Court, and met her as I was coming from school, when she used to "pose" me in Latin and verses; and passing readily from the solidities of grammar to lighter logic, in which she excelled, she would "shut me up" by the subtle threads of her arguments, and then make her maid count me out three

or four coins, and send me to the royal larder to refresh myself, and so dismiss me.

But, alas! one sentence alone is enough to condemn Ingulf as a historical romance:

I, the humble servant of St. Guthlac, was sent in my tender age to learn letters first at Westminster and afterwards at Oxford school.

Now, whatever disputes there may be as to the exact origin of Oxford University, there is no dispute that it did not exist before the Conquest. But, indeed, it has been conclusively shown that the pseudo-Ingulf is not earlier than 1486. Failing Ingulf, some Westminster antiquaries adopted the guesses of Stow, who identified Westminster School with one of the three schools of London mentioned by Judge Fitzstephen in his "Life of Becket," as meeting in contests of verses and grammar and epigrams in the morning at St. Paul's and in games of football in Smithfield in the afternoon. But Stow forgot, as the first scientific historian of Westminster, Richard Widmore, pointed out in 1751, that Westminster was not in London. In 1130, when Becket was a boy, it was a distant suburb. Moreover, some editions of Fitzstephen give the names of the schools, viz., St. Paul's, St. Martin's-le-Grand, and St. Mary-le-Bow, which as late as the reign of Henry VI. were still the only authorized schools of London.

But, though particular history fails to produce any evidence of the existence of Westminster School, such as is actually extant for Warwick School in the days of King Edward the Confessor, or for St. Paul's School when Thomas à Becket was a boy in the days of Henry I., there is always the general theory of the school of the Abbey to fall back on. The bench is actually shown in the cloister on which the Westminster Abbey School boys played a kind of solitaire with nine holes; and the nine holes are to be seen unto this day. That Westminster, like every other monastery—Benedictine monastery, at least—kept a so-called "School" of Novices, there is, indeed, no doubt. But, if we figure it out, a School for Novices becomes a very small thing. When Westminster Abbey was surrendered to Henry VIII. there were only twenty-four monks; and, as you went on being a monk all your life, that is, from, say, eighteen to sixty or over, it may easily be reckoned what proportion of the twenty-four would be likely to be novices. It is true, however, that the normal number of monks at Westminster was double twenty-four. Thus, in 1520 there were fifty-two and in 1510 forty-six monks. The full number was probably sixty. This was the full number at Winchester. The accounts of Winchester, published by Dean Kitchin, tell us, in connexion with payments for beer and knives supplied to the youths in school, the numbers there were in the Novices' School. They never exceeded nine, and were generally below six, while in at least two years there were none at all. Outsiders were forbidden by the statutes to be taught with monks. Moreover, the main subject of instruction was not grammar—that is, classics—but the Rule of the Order. The monk was not, as a rule, learned. When Westminster, with other Benedictine monasteries, began to send representatives to Oxford, it only kept three at a time there. This was doubled by the addition of three "Scolers of Kyng Henry the VIth," by that King's chantry foundation, because he said he had by "long experience perceyved that vertue emonges religious men" (*i.e.*, monks as opposed to secular clergy) "is little used, religion greatly confounded, and fewe or no hable persons found in houses of religion" (*i.e.*, monasteries as opposed to colleges). But, if one swallow does not make a summer, neither do half a dozen scholars in the Rule make a grammar or public school. Old Westminsters will surely reject Dean Stanley's claim of the Novices' Master as "the beginning of Westminster School."

There was, however, at Westminster a real Grammar School, which, though of modern foundation compared with claims now repelled, is yet of sufficient antiquity to put Westminster above Winchester or Eton, if it cares to claim descent from an institution of rather humble status.

This was the Grammar School in the Almonry of the Abbey, which stood somewhere between Dean's Yard and the Army and Navy Stores. It was known to Widmore, but he did not work out its history in detail.

Through the courtesy of the late Dean Bradley, I examined the extant accounts of the Almoners from their beginning to the Dissolution, and they reveal an interesting anticipation of what

was common under the Endowed Schools Acts five centuries later, the diversion of an eleemosynary charity to educational purposes. The Almoner was the monk who gave alms for the Abbey, originally by distributing the broken meats at the gate of the monastery. By the date of the earliest extant account at Westminster, 1282, he had separate endowments at Knightsbridge, Paddington, Battersea, and Claygate in Surrey, producing about £60 a year, and lived in the Almonry, an almshouse outside the Abbey, with ten brethren and sisters, who each got a farthing a day and gowns of russet, while thirteen "brethren and sisters of St. Edward" received 10½d. a quarter, or somewhere about the ninth of a penny a day. As Gregory of the Parlour, a servant, was paid only a penny a week, the pay was not so bad as it sounds. The next account, for a quarter of the year 1317, shows an educational payment, "In maintaining Nigel at school for the love of God, 2s." In 1320 Nigel was still at school, and his keep "for the whole year except Autumn" cost 13s. 8d. Who Nigel was and where he went to school we can only guess; but the amount suggests that it was at the University and that Nigel was a poor scholar.

Nothing approaching an educational payment appears again for nearly forty years. In 1354 there were payments for "the expenses of 2 boys, 2s.," and for "clothing the boys in the Almonry, 30s." Next year, 1355-6, there was paid to brother John Wallingford "for cloth for the boys of the Sub-Almonry, 8s. 8d.," while another payment appears, which is never repeated: "There is allowed him 2s. 8d. for the expenses of a clerk being in the Almonry and teaching my brethren [*i.e.*, the monks] broken song." Broken song is distinguished from plain song. No boys appear again until 1362-3, when they had been increased in number and there was "paid for cloth for the boys of the Almonry, 24s. 5d." From that time until the Dissolution there is a payment every year for the cloth for boys, sometimes described as being in the Almonry, sometimes as in the Sub-Almonry, varying from 27s. to £10. Concurrently the number of brethren and sisters in the Almonry seem to have been reduced to five; the sisters of St. Edward disappear altogether; and the brethren—or, as they are sometimes called, the Knights—of St. Edward were cut down to six. So there must have been a regular scheme for substituting boys for almswomen. There is, however, no mention of a master for these boys till 1367-8, when we find "one gown [*roba*] bought for the Master of the said boys, with his stipend, 26s. 8d." Two years afterwards there is paid

to the Sub-almoner for boys of the Sub-almonry against St. Nicholas' Day [the day of the Boy-Bishop's ceremony] 9s. Cloth for the boys of the Almonry, 46s. 8d.; for fur for the Boys' Master, 2s., and to the tailor for making the clothes of the boys of the Almonry, 2s.; for shearing the cloth, 16d.; and in the stipend of the Master of the boys this year, 13s. 4d.

It is another twenty years before, in 1387-8, the Master is called a "schoolmaster": "In cloth bought for the Schoolmaster [*Magister scolarius*] and boys in the Sub-almonry with the shearing of the same cloth, 50s." In 1394 the items appear in a new form, which is thenceforth, with slight variations, continued to the Dissolution: "To the Schoolmaster for teaching the boys by the year according to agreement, 13s. 4d. In cloth bought for the Master and boys with shearing the same, 50s. And for fur for the Master, 22d."

In 1395-6, by "a new agreement," the Master was paid 20s., and in the following year 26s. 8d. At this rate he continued to be paid year after year to 1479. Thence onwards he was paid 40s. a year. After 1387 the schoolmaster is generally described by the full and correct designation of *Magister scolarius*; but he is sometimes simply *Magister puerorum*, and once *Magister scole*. In Henry VI.'s reign and later he is distinctly called *Magister scolarius*. This variety of description is equally found in the Winchester College Account Rolls. The use of *scolarius* in the plural is correct, but means only a single school.

The Master and boys were lodged, and presumably boarded, as well as clothed, at the Almoner's expense. A school-house was provided. In 1414-15 payments were made for mending the school wall, and in 1421-2 there is a complete account for rebuilding the school-house. With four chambers and four chimneys, it cost £32. 9s. 9d. The special mention of chimneys shows that the building was of "post and pan," the chimneys only of stone and brick, or Flanders tile, as it is called. It

stood "at the end of the grange," by "le Millebank," and in 1446 is described as "le Sope-hous," now called "School-house." In 1447 a curious item occurs of "16d. for making a 'gyn' on the chapel of St. Anne to stop the players at ball there." Presumably these early ball players against the Almonry Chapel were the boys of the Almonry School.

The payments for cloth enable us to determine with tolerable certainty the status of the Almonry School Master and the size of his school. The 5 yards of cloth which the Master had was the same as the allowance of the Usher of Winchester College, being a yard less than that of the "Conducts," or hired chaplains, and 3 yards less than the Head Master's allowance. At Winchester the Head Master was allowed 3s. 4d. for fur; at Westminster his fur cost 18d. or 16d. He was, therefore, rather an inferior sort of person. He was sometimes a married man, and therefore not in Holy Orders. The recent researches of Dr. Scott, who is arranging their muniments for the Dean and Chapter, have produced from other officers' accounts other light on the School. From 1425 to 1435 the house belonging to the Sacrist built for the Knoll chantry was let to John Newbrough, Schoolmaster, and Margaret his wife; while in 1491 among the "liveries" for gentlefolk was one for "the Schoolmaster's wife." Four consecutive Head Masters of St. Peter's School at York who received a salary of £5 a year were in the fifteenth century married men, while several of the mediæval Head Masters of Winchester were laymen. The schoolmaster was not always in the best of company; for in 1467 Mr. William Salkeld, Schoolmaster of the Abbey, was surety with a grocer for Richard Salkeld, presumably a brother or other near relation, servant of Philip, Squire of the King's Household, for an assault on the servant of a Crown valet. In 1494 William Baker, "Scolemaister," was himself fined 3s. 4d. for an assault which drew blood from Thomas Kyrkeham—Kyrkeham being fined 1s. Such incidents, however, were not unknown; for the first we hear of the Grammar School Master at Ripon, in 1348, is his being indicted for felony, and Canons were not infrequently guilty of violent assault.

The number of boys can be deduced from the amount of cloth. There were 24 yards to the piece; 3 to 4 pieces was the number generally bought. At 4 yards a boy, this would make the number of boys vary from 18 to 24. This estimate from the Almoner's accounts is confirmed by other accounts. Thus, in 1373 the Treasurer of "Queen Eleanor's manors" paid to the boys' master and 13 boys 2s. 2d.; and in 1385 to the master 6d. and to each of 28 boys 2d.; while in the next year and in the two following years there were 22 boys. No other indication of numbers appears to be forthcoming.

In 1479-80 we suddenly come upon a totally new payment in the Almoner's accounts—which shows that here, as elsewhere, the school was no mere choristers' school, the choristers' master being distinct and inferior—among the "wages of servants," viz.: "Paid to William Cornysse for teaching the singing-boys for half a year, 6s. 8d." Next year the same entry appears, the sum paid being for the full year 13s. 4d. Yearly, to the Dissolution, the entry appears in the same terms, the name of the teacher only changing. He is never given the title of Schoolmaster or termed Master at all. On the other hand, soon after this, the entry of the payment to the Schoolmaster "for teaching the boys" is changed, first, by the addition of the words "of the Almonry" (*Elemosinarie*): and from 1510 onwards by calling them "grammar (*gramaticorum*) boys." In the year after the first payment is made to the teacher of the singing boys the Schoolmaster's salary is raised from 26s. 8d. to £2 a year. During the reign of Henry VIII. the entry as to cloth for the boys is enlarged by an extra sum of 30s. paid "to the Under-almoner for cloth for the singing-boys." It seems clear, therefore, that the singing-boys and the Song School were an addition to, and not a selection from, the ordinary Almonry boys and their Grammar School. The inferior position of these choristers and their master seems to be emphasized by the inclusion of his salary among servants' wages, while the payments to the Schoolmaster, the Grammar School Master, as we may now call him, were always included under the separate heading of "Necessary Expenses." The appearance of these singing-boys coincides with an increase of income derived from fourteen new houses built in Tothill Street, now Victoria Street, on the Almoner's ground, with money which appears in the Almoner's accounts, 1472-3, for the anniversary of Richard Harrowden,

late Abbot. They were probably due to a special bequest for that purpose under his will, and were a distinct foundation. The increase of the Schoolmaster's salary might be partly because of his having to teach these additional boys grammar.

The small sum for cloth and for teaching them points to a small number, and we may fairly conclude, from analogy, that they were not more than half a dozen in all. This is borne out by a recent find of Dr. Scott, under the year 1536, of "delivered 6 peyer of showes unto the chylidryn of the Syngging Scole." At the same time two pairs of shoes only were delivered to the children of "the Gramer Scole"; but others were soled.

Analogy suggests that the Almonry School itself was a mere charity school. At Canterbury, where the Almonry foundation, with a separate chapel and chapel clerks and boys, dates from 1319, the Almonry boys were definitely used as servants for the monks in the Infirmary. The same was the case at Durham, where when a monk died Almonry boys had to sit round his corpse all night. At Winchester Cathedral the Almonry boys were also apparently "children of the chapel," the Lady Chapel. We can hardly doubt that these Westminster Almonry boys were in like case; and, as the Winchester College choristers waited on the scholars, so did these Westminster boys on the monks.

Westminsters must therefore make their choice whether, with a view to antiquity, they affiliate historically the present Grammar School of the College of St. Peter, Westminster, to the Almonry or Charity Grammar School of 1354, or whether they will be content with the more modern, if more august and strictly legal, pedigree of Queen Elizabeth's restoration in 1560 of her father's foundation of 1540 of a school for forty free scholars and as many others as choose to pay, on the model of the York Cathedral Grammar School and the Collegiate Grammar Schools of Winchester and Eton.

A. F. LEACH.

THE HEAD MASTERS' CONFERENCE.

THE Annual Conference was held at Christ's Hospital, Horsham, on Thursday, December 22, and Friday, December 23.

In consequence of the fog, the London train by which most visitors arrived was more than an hour late, and the first sitting had to be postponed till 3 o'clock. At Horsham there was only a slight haze, and the trees on either side the line glistened with a crusting of hoar frost. Among those present were Rev. T. Layng (Abingdon), Mr. King (Bedford), Rev. A. F. Titherington (Brighton), Dr. Rouse (Cambridge), Dr. Rendall (Charterhouse), Rev. R. Waterfield (Cheltenham College), Dr. Flecker (Dean Close, Cheltenham), Rev. R. D. Swallow (Chigwell), Rev. C. R. Gilbert (Coventry), Rev. J. M. Dove (Denstone), Rev. W. C. Compton (Dover), Rev. A. E. Hillard (Durham), Rev. T. N. H. Smith-Pearse (Epsom), Rev. H. A. Dalton (Felsted), Mr. W. W. Vaughan (Giggleswick), Rev. A. N. F. Hyslop (Glenalmond), Rev. W. C. Penney (Guernsey), Canon Lyttelton (Haileybury), Rev. A. F. Rutty (Leatherhead), Mr. Rushbrooke (St. Olave's), Dr. Gow (Westminster), Mr. Fletcher (Marlborough), Rev. W. C. Eppstein (Reading), Dr. Field (Radley), Dr. James (Rugby), Rev. H. W. Moss (Shrewsbury), Rev. H. A. P. Sawyer (St. Bees), Rev. A. C. Tancock (Tonbridge).

The CHAIRMAN, in welcoming the Conference, apologized for the weather, which had not only reduced the numbers attending, but threatened to prevent those present from seeing the site which formed half the attraction of their new home. He had desired to show them an ancient school refounded with every equipment that modern ingenuity could suggest. It had been described as "an arrogant red-brick town which the fastidiously urban shade of Charles Lamb could surely never visit." Time would tone down their crudity, but he hoped that even now his visitors would not endorse this aspersion.

Pupil-Teachers in Secondary Schools.

In the absence of Mr. Keeling through indisposition, the third resolution on the agenda was taken first. Mr. SAWYER (St. Bees) moved:

- "(1) That this Conference pledges itself to support the Education Authority in its policy of sending intending elementary teachers to secondary schools in lieu of pupil-teacher centres.
- (2) That a Committee be appointed to consider the question in its application to the schools represented on this Conference."

It was a question not only affecting the schools of Conference head masters, but of national importance. All would approve the principle

underlying the Regulations of the Board of Education—that those about to teach in primary schools should have a chance of sharing the life of a secondary school and catching something of the public-school spirit. It was an attempt on the part of the Board to bridge over the gulf fixed at present between primary and secondary education. But there were serious difficulties in the way of applying the scheme to the schools they represented. It was impossible for boarding schools to have boys sent to them at sixteen, working as a class apart, and, even if possible, it would be socially most undesirable. Two points seemed to him essential. Intending secondary teachers must come to them young, at twelve or thirteen—this could be easily effected by means of scholarships; and, secondly, they must receive the same education as boys intended for other professions.

Mr. TITHERINGTON (Brighton College) seconded.

Mr. SWALLOW (Chigwell) moved, as an amendment, to read after the first line: "shall receive a substantial portion of their education in secondary schools, and that as many recruits as possible for teacher-ships in elementary schools should be obtained from the ranks of ordinary pupils in secondary schools." Pupil-teacher centres were merely tolerated till Mr. Morant's scheme should come into full operation. As to the proposed addition to the resolution, they did not want merely to receive pupils sent to them by the different Local Authorities earmarked from the first as pupil-teachers, but to be able to select from their regular pupils those best qualified for this branch of the profession. All who had observed the teaching in elementary schools and compared it with their own must have recognized that there was something lacking—solidarity, enthusiasm for the corporate body—in a word, character. If they were to do any real good in the training of teachers, they must stir up a desire among their own pupils to become primary teachers. To do this, and to be able to persuade parents to give their consent, the pay of teachers must be raised. He thought it would be quite possible, even in small boarding schools like his own, to work the half-time system.

Mr. LAYNG (Abingdon) seconded the amendment.

Mr. SAWYER accepted the amendment in lieu of his resolution, which was carried as a substantive resolution.

Secondary School Certificates.

In the absence of Mr. Keeling, Dr. FLECKER (Dean Close School, Cheltenham) moved the first resolution, with an addition:

- "(1) That this Conference approves in general of the proposed scheme for (secondary) school certificates, but is of opinion that, in order to make the certificates more uniform and authoritative, the ultimate responsibility of examination and award should rest with a central and thoroughly representative council. And (2) that the utility of the scheme will be considerably impaired if the various professional bodies at present holding preliminary examinations do not consent either to alter or abandon their examinations or to modify their schemes of recognized 'equivalents.'"

He recalled the action of the Head Masters' Conference in 1890, protesting against separate professional examinations which had led up to the scheme of the Consultative Committee. In small schools the evil was serious. Boys were withdrawn from their ordinary form work and compelled to read special books. They wanted a reduction in the number of examinations, and, unless he was assured that the new examination would supersede the others, he should not support the scheme. It was only a general approval that was asked for, and there were many details in the scheme which needed amendment. Some of them had been pointed out in Mr. Gilson's report to the I.A.H.M. The relations between the masters of a school and the external examiner were complicated and unworkable. Again, the results, put in the hands of head masters, should simplify, and not, as under proposed conditions, complicate, internal examinations: they must be such as to enable them to award prizes and determine promotions. The proposal that no school should be examined till it had been inspected was partly reasonable and partly unreasonable. It was reasonable to ascertain that the curriculum and teaching of a school were sound; it was unreasonable to refuse a candidate for a certificate because the drains in his house were defective. Again, there was the danger of a system of rival leaving certificates. The Joint Board had already brought out one of its own.

Dr. HOUGHTON (St. Edmund's School, Canterbury) moved as an amendment: "That this Conference expresses general approval of clauses 1 to 7 in the system of school certificates proposed by the Consultative Committee."

Mr. H. C. WATSON (Great Crosby) seconded the amendment.

Mr. SWALLOW thought the matter too important to be decided off-hand by the Conference. It ought to be referred to a Committee. The Committee of the I.A.H.M. had taken several prolonged meetings to arrive at their report.

Mr. MOSS (Shrewsbury) thought it a most invidious thing to ask masters of schools to report on their own pupils. Members of Conference had not come prepared to discuss the several clauses of the scheme.

Mr. DOVE (Denstone) desired that the attention of the Committee

should be directed to a grievance acutely felt by his colleagues in the Midlands. County Councils seemed bent on starting schools of their own for the training of pupil-teachers which were likely to cripple and eventually kill existing secondary schools. There was in consequence a vast waste of effort, and, to judge from one instance within his knowledge, these new County Council schools were nothing but primary schools writ large.

The CHAIRMAN said that the authorities of Christ's Hospital had already done what they could to meet the wishes of the West Sussex County Council. By attending for two years one of the endowed schools which was recognized as the channel of entrance to Christ's Hospital, County Council scholars could be admitted to the foundation. He agreed with Mr. Swallow that for the improvement of elementary teachers there must be a downward action. He had induced two of his Canterbury boys to become elementary teachers, and two of his present pupils were intending to do the same.

Mr. Swallow's amendment was then carried.

On the second half of Mr. Sawyer's resolution, objection was taken to referring the matter to one of the standing Committees. Mr. SWALLOW said that there were Committees which never met. He had for five years had the honour of being a member of the Parliamentary Committee, but during that time he had never been summoned, though some not unimportant educational measures had meanwhile been passed. The form eventually agreed upon was:—"That the matter be referred to the Committee of the Conference with a request that they will act promptly in the matter."

A rider moved by Dr. RENDALL, urging the necessity of recognizing the years spent in preparatory schools as part of the period required as a condition for the Lower Certificate, was rejected.

A second rider, moved by Mr. MOSS, instructing the Committee to obtain in writing the opinion of every member of the Conference upon the points raised by the Scheme, was carried.

Cadet Corps.

After the meeting for private business, the second resolution was moved by Mr. WATERFIELD:

"That it is desirable to consider the advisability and the feasibility of making membership of the cadet corps compulsory on boys at the public schools, and of making common cause for the promotion of that object."

Mr. Waterfield recalled the remarkable vote of the Conference in 1900, when, on the motion of Dr. Warre, it was carried by 82 out of 93 present that compulsory military training ought to be insisted on in public schools for all capable of bearing arms over the age of fifteen. It was no good looking for Government support to help them to carry out this resolution. The present Secretary for War would return the same *non possumus* answer as his predecessor. He would meet categorically the three objections likely to be raised. (1) "It was the thin end of the wedge of conscription." In his view cadet corps were the best prophylactic against conscription. (2) Quakers and the Peace Party would protest against the encouragement of militarism. But we had to be practical people as well as Christian people. (3) "It would be a burdensome addition to school expenses." There were already compulsory subscriptions to games in nearly all schools, and he reckoned that on a basis of five hundred boys the additional expense entailed, exclusive of the initial cost of uniform, need not amount to more than a guinea a year. The time must be taken out of play hours, and in the opinion of his staff cricket and football would not suffer. His Council at Cheltenham had asked him to drop the proposal on the ground that it was too dangerous an experiment. That showed the need for common action.

Mr. COMPTON seconded. At Dover he had solved the question with a corps of about a hundred and twenty boys. New boys on entering were put to learn drill, and they were keen enough to be promoted to the cadet corps. Their subscription was 10s. a term.

SECOND DAY.

The Rev. C. EPPSTEIN (Reading), continuing the debate, urged the increasing needs of the Empire. Public opinion was not ripe for conscription, and the only alternative was to instil into the mind of every citizen from his youth up that it was his duty to do something for the defence of that Empire. This granted, a cadet corps should not be voluntary; it should not be dependent on the popularity of the officer for the time being. Before turning his corps into a compulsory one he took the advice of other masters. They all said: "Go on and prosper. A most interesting experiment: if it succeeds, we will follow our leader." It had succeeded. He had found no difficulty with either parents or boys, and the sergeant-major told him that it was now much easier to maintain discipline.

A letter was read from Mr. BARBER (Leys School, Cambridge) deprecating compulsion. Such a measure would exclude from school life the sons of Quakers and all who, however mistakenly, objected to war under any condition. He limited the numbers of his cadet corps to about half the school, and admission to it was regarded as a distinction.

Mr. KING (Bedford) moved that for "membership of the cadet corps" should be read: "drill and training in the use of arms."

Dr. RENDALL strongly opposed compulsion. The expenses of a cadet, including uniform, field days, &c., could not be put at less than £3 a year. In a large school it was not easy to provide accommodation for shooting. At Charterhouse they had difficulty in arranging for two hundred and fifty boys. For national defence we must look not to cadet corps, but to Volunteers, and there was a danger if there was compulsion at schools of creating an actual dislike of Volunteering.

The amendment, seconded by Mr. SWALLOW, was carried.

Mr. DOVE (Denstone) moved to substitute for "compulsory on boys," "an essential part of the education of as many boys as possible." Military training consisted of drill, manœuvring, and the use of arms. Drill could form part of the gymnasium instruction; manœuvres would be practised by the rifle corps as at present constituted; but the use of arms should form part of the regular school instruction, just like English or science.

Mr. SWALLOW said his school rifle corps cost only half the sum named by Dr. Rendall. If they made military drill compulsory, boys would voluntarily join the rifle corps. He warned the Conference that they would get no sympathy whatever from the War Office. Mr. Gull's Committee had had an interview with Mr. Forster, and received no encouragement. But their righteous demand, if pressed, would lead, if anything would, to the abandonment of office by the present Government.

Mr. ROUSE had found the War Office squeezable. It had sanctioned a uniform which cost only 25s. and could be used in civil life.

Mr. PENNEY had got from the War Office all he wanted. Their cadet corps in Guernsey was run at the cost of £1 a year, inclusive of uniform.

Mr. Dove's amendment was lost; and Mr. King's amendment was carried with three dissentients.

Compulsory Greek.

Mr. LYTTETLTON, in opening a discussion on the Report of the Cambridge Syndicate, moved:—

"That, without committing itself to details, the Conference generally disapproves of the Cambridge Syndicate's Report with regard to Greek in the Previous Examination."

He explained the difference between the Oxford and the Cambridge proposals. There was a time when, from his experience of the profitlessness of Greek in the case of a number of boys who were learning it at school, he was prepared to shout with the loudest in favour of some relaxation, but he did not then know how far this relaxation would go, nor what substitute would be proposed. The Syndicate laid down that the alternative should be of a literary or linguistic character. He strongly dissented from that view. The boys who failed to profit by Greek were those whose linguistic capacity was almost nil, and they would show the same incapacity of learning a modern language. As soon as they came to the difficult parts of French and German, the same results might ensue. Conversational French was not the same study. If these intellects were to be developed, it must be by some other instrument than linguistic study. A boy who could not do Greek should do science or handicraft. Again, it had not been shown during the last fourteen years that any appreciable number of boys had been excluded by compulsory Greek. He had not known a single such case at Haileybury. He should like to know how many of his opponents had taught the "Phædo" of Plato to a Sixth Form, or the twenty-first book of the "Odyssey" to any form. Those who had not were no competent judges of the question.

Mr. MOSS seconded.

Mr. COMPTON (Dover) had voted against the Oxford resolutions. Greek was no burden. A boy in his Army class who passed for Sandhurst, and was then rejected on grounds of health, went up to Cambridge and had passed the Preliminary by devoting half a term to Greek.

Dr. JAMES said that the dropping of Greek in preparatory schools was going on with alarming rapidity. At Rugby he had had to take away one class from the Classical and to make a new class on the Modern Side. If at this stage we found these tendencies at work, what were we to expect when the Cambridge proposals were carried? In twenty years Greek would have practically disappeared from our schools. As a schoolmaster he was bound to oppose tooth and nail the Cambridge, and in a less degree the Oxford, proposals.

Mr. W. W. VAUGHAN (Giggleswick) had satisfied Mr. Lyttelton's test, and yet ventured to think that the Conference would do very unwisely in passing the resolution without further discussion. He grieved over the time wasted during their last year at school by science boys in learning Greek, from which they got no good. If the alternative were permitted, they might learn something of Greek literature, of which they now learned nothing, and of English literature too. Most people knew more of Hebrew than of Greek literature, though Hebrew was not taught in schools.

Dr. ROUSE said that, though his school was in a University town, he found it hard to resist the pressure of parents to obtain for their sons an exemption from Greek. The relief was claimed for the sake of a

few intellectual cripples. The proposals of the Syndicate seemed to be liberal and progressive, but they were a complete sham.

Mr. PENNEY suggested that, after all, the British parent might have some *modicum* of sense at the back of his head; that it was not illiberal and unprogressive to hold that in our crowded time-tables there was not room for a double dose of antiquity. Was there time for Greek as well as Latin in the case of the ordinary boy? To take Greek and Latin was to specialize in language more than was advisable except in the case of a select few.

Mr. MOSS said that the carrying of the Syndicate's Report was tantamount not only to the extinction of Greek within twenty years, but also to the great deterioration of Latin.

Mr. C. K. GILBERT (Coventry) said that Greek was declining as a school study, and would continue to decline whatever the Universities might resolve. The sense of the country was that it should be made a special study. He was sorry that the Conference seemed disposed to stamp on the Cambridge proposals. He wished something to be done for the sake of the boys.

The motion was carried by 21 votes to 8.

Latin in Army Examinations.

The Rev. H. A. DALTON (Felsted) moved:

"That this Conference hopes that the scheme or qualifying certificates in the examinations for Woolwich and Sandhurst will be so amended as to encourage the study of Latin."

He was sorry that the Rev. M. G. Glazebrook was not present to bring the matter up, as he had discussed the subject in the *Times* some months ago. He hoped that he would have the assent of every member of the Conference to the resolution. A training at least in Latin, if not in Greek, was an essential part of a really liberal education, because it constituted the link between the modern and the ancient world, and it was unrivalled as a means of training in accurate thinking. Many members of the Conference might think that at the best the resolution was merely a pious opinion, and that they need not take any action in the matter, but, if the military authorities were presented not only with a very strong condemnation of the final examination, but also with the unanimous vote of the Head Masters' Conference against the action which had been taken in regard to Latin, he thought they would secure some change. There did not seem to be any difficulty in changing Army examinations at intervals of six months, and he thought the authorities might be persuaded to do that. Candidates for the Army were not particularly strong. They would choose the easiest subjects for obtaining marks, and in the course of time all Army boys would be found taking Science and French or German. He thought that all boys who went in for the qualifying certificate for the Army, or any certificate which corresponded to that, should be required to take two languages, one of which at least should be ancient. He thought that would satisfy all requirements.

Dr. G. RENDALL (Charterhouse), in seconding the motion, said that an appendix to the report of the Committee of the Head Masters' Conference pointed out some of the most salient objections to the scheme of certificates which had been somewhat hurriedly thrust upon the schools by the War Office. He felt that the method in which it had been thrust upon them was quite deplorable. It was an instance of irresponsible action which was still permissible in the field of education. Quite suddenly, without warning, without authority, without consultation with any of the Educational Authorities in the country, whether the Board of Education or otherwise, a small and irresponsible, because unstable, committee of the War Office had put forward a scheme of qualifying and competitive examinations which necessarily affected the studies of the schools at large, and to a much greater extent than they suspected. And that was done by a small changing committee, who had no practical acquaintance with the operations of schools, or with their curricula, which would isolate candidates for the Army from the candidates for other professions and other walks in life. A really most exasperating inconvenience would be experienced when one had to draw up a time-table which would satisfy the demands of that particular scheme and also the demands of a general education. It was not possible that Army candidates should be isolated from other schoolboys who were going forward to the University or to other professions, and yet the appendix showed that that was the practical effect of the examination.

The resolution was carried *nem. con.*

On the motion of Mr. H. A. DALTON (Felsted), seconded by Mr. WATERFIELD (Cheltenham), a rider was agreed to: "That the Committee be requested to make a strong representation to the War Office on the subject."

English Literature.

Mr. COMPTON (Dover) moved, and Mr. GILBERT (Coventry) seconded, the following motion:—

"That the Committee be asked to consider the syllabus issued by the Board of Education on the teaching of English literature and to include their recommendations in the annual report."

Mr. Compton said that it was not necessary for the circumstances to be explained; all they wanted was advice and instruction, through the

Committee, after due deliberation, as to what was the best way of putting into effect some scheme, whether that of the Board of Education or otherwise, for meeting the requirements of the schools in the direction of the study of English literature.

The resolution was agreed to.

Bisley.

Dr. G. RENDALL, in the absence of Dr. Burge, in whose name the resolution stood upon the agenda, moved:

"That the members of this Conference accept and undertake to carry out the principle of not allowing their boys to practise at Bisley except on one day previous to the competition for the Ashburton Shield."

Dr. C. C. TANCOCK (Tonbridge) seconded the motion.

Dr. GOW (Westminster) pointed out that it was impossible that his school should carry out the resolution, because the ranges round London were gradually getting closed, and those which existed were so crowded that they could not get in. Therefore, Westminster School was obliged to practise at Bisley.

Mr. HYSLOP (Glenalmond) pointed out that the Scotch schools would also be placed under a great difficulty if the motion were passed, and it would act most unjustly towards them.

Mr. SWALLOW moved the previous question. It was a matter of good taste that could not be dealt with by resolution.

Mr. LYTTETON seconded, and the motion was carried.

A vote of thanks to the Chairman, moved by the Rev. the Hon. E. LYTTETON, and seconded by the Rev. H. W. MOSS (Shrewsbury), was carried by acclamation, and Mr. ANDRADE returned thanks on behalf of the Assistant Masters.

In the course of the proceedings it was announced that the members elected to fill vacancies on the Committee were Mr. Fletcher, Mr. Moss, and Mr. Upcott.

COLONIAL AND FOREIGN NOTES.

FRANCE.

Nearly ninety-two years of age, M. Henri Alexandre Wallon died on November 13. Playfully called the "Father of the Constitution"—for it was his action in 1875 that determined the form of the present *régime*—

he was notable in the later stages of his career chiefly as Senator and politician. But he was also a historian and the perpetual Secretary of the Academy of Inscriptions, and his connexion with education was such that he is aptly described as the *doyen* of French teachers. From 1831 to 1834 a pupil of the Ecole Normale, he applied himself to teaching as to the work of his life. He taught history in the Collège Rollin, became *maître de conférences* at the Ecole Normale, acted as Guizot's deputy at the Sorbonne, and even served for a year (1875-6) as Minister of Public Instruction. A treatise on education that he wrote in 1848 is characterized by the dedication, which was to Pio Nono. But his strong clerical tendencies were controlled by natural benevolence, and, as Minister, he initiated several just and useful measures, creating new chairs and raising the number of *agrégés* in Science and Letters. Of his publications, studies of Jeanne d'Arc and of the English King Richard the Second are less well known than the copious "Histoire de l'Esclavage dans l'Antiquité," in which he ascribes to Christianity the greatest share in the abolition of slavery. The dead scholar's life, conspicuous in France, will appear peculiarly enviable to many English teachers—forty years of teaching crowned by Ministerial office and still thirty years to live in library or Senate.

The meeting of the Ligue de l'Enseignement, one of the chief events of the year for those who are concerned with primary education in France, was held in 1903 at Amiens, and was the occasion of many interesting discussions. Among the most noticeable may be

signalized that which arose about what is called in Michelet's formula "education by *fêtes*." Commemorative celebrations, at which children and their relatives gather, are becoming more frequent and more numerous attended; it is desired to render them also more useful. The Ligue addressed to the 3,300 societies affiliated to it the expression of a wish that such celebrations should assume as educative a character as possible; that they should be animated by a republican spirit; that they should commemorate the decisive events of history or keep alive the memory of the great servants of France and humanity; and that those who organize them should study carefully the literary and artistic devices most likely to bring out the meaning of the several commemorations. But no less interest was kindled by a debate on the inculcation of pacific ideas. These, said the Leaguists, are not incompatible with the most ardent patriotism; "a confidence in the possibility of settling international differences by means of a respect for right and without appeal to force, far from weakening the notion

of a fatherland, does but strengthen, elevate, and purify it alike in the individual and in the public consciousness." A third topic discussed possesses a growing importance for every civilized country. Apprenticeship in manual trades is dying out. Where it continues, the work of the apprentice is being reduced by the improvement of machinery to a mechanical discharge of petty offices. Whilst education seeks to make of him a *living intelligence*, the tendency of progress in the material world is to transmute him too into a dead machine. The Congress seemed to discern a remedy for the evil in the organization of some form of compulsory professional training for both sexes, the State undertaking to train the hands, as well as to quicken the minds, of the young. Economic as well as other difficulties might bring the scheme to nought. Upon the subject of school attendance the Ligue is not convinced that the legal obligation to send children to school has ever been converted into a reality. Nor has it in England. As to the teaching of morality, France has diverged so far from us that it would profit but little to examine the conclusions reached at Amiens. We report the general proposition of the French schoolmen simply to show their point of view. "Morality is the product of human evolution. By its methodical development it becomes more and more scientific. It is not connected with religion. It has a purely human object, which is to govern the relations of men and peoples according to the laws of reason and the dictates of science."

The statute (of 28th March, 1882) on which compulsory education depends lays down that children of either sex must attend school from the completion of the sixth to the completion of the thirteenth year. Some have

Abnormal Children.

escaped the meshes of the law; to others it has never been applied, because it is not applicable. The latter class consists of children intellectually, morally, or physically abnormal, who would be a disturbing or pernicious element in a class-room. Yet to these, too, the State owes a duty—the performance of which it has left hitherto mainly to private benevolence. Only for the deaf and dumb and for the blind has it made some scanty provision. After extensive inquiries at home and abroad M. Chaumié has recognized the facts of the situation and appointed a committee of experts to study the whole question.

Meanwhile another committee, appointed last year, has presented to him the result of its deliberations. It is that which was charged to consider what simplifications might fitly be introduced into French orthography. We

Spelling Reform.

deal with the matter because we believe that reform is actually impending; that it is not, as in England and America, merely a pious hope. An ideal orthography, say the learned commissioners, would employ one sign for one sound, the number of signs being exactly equal to the number of sounds. But this would involve a reconstitution of the French alphabet, and so vast a labour did not lie within the province of the committee. Its work was to suggest practicable and simple changes. Wherever several ways of representing a sound had been used it had to select the best and apply it as widely as possible. Nor has it found itself able to pursue this limited aim with logical consistency; thus it has allowed the two groups in *an* and *en* to remain, although in pronunciation the first has entirely absorbed the second. Nevertheless its recommendations are drastic enough. We give some of the chief of them in a condensed form.

A. As to diacritical marks:—The grave accent should be discarded when it is useless, as in *déjà*, and when it only serves to distinguish words, as in *à*, *là*, and *où*; on the other hand, acute and grave should be used more consistently in marking the *timbre* of the vowel *e*—e.g., *événement* being written, not *evénement*, and for the futures of *céder*, *compléter*, and *régler* the forms *cèderai*, *complèterai*, and *règlerai*. A circumflex accent should not be retained when it only indicates the suppression of a vowel or consonant: we should write *du*, *assidument*, *île*, *maître*; not *dû*, *assidûment*, *île*, *maître*. Dieresis placed on a vowel to show that it does not make a diphthong with a preceding vowel is to be kept (e.g., in *hair* and *Saül*); but not on an *e* whose sound is shown sufficiently by the consonant that follows (*Noël*, not *Noël*). It is to be kept, too, on the semivowel *i* (*aïeul*, *baïonnette*, *païen*); and analogously we should write *baïadère*, *caïer*, and *maïonnaise* for *bayadère*, *cahier*, *mayonnaise*.

B. As to vowels:—For *femme* it is proposed to put *fame*. The combination *ien*, representing two pronunciations—it is to be retained in *chien*, *bien*, *chrétien*, &c.; but in *client*, *orient*, &c., *-ient* should be replaced by *-iant*. *Faon*, *paon*, *taon* should become *fan*, *pan*, *tan*. The various modes of writing the sound *eu* (*eu*, *œu*, *œ*, *ue*) can hardly be reconciled, owing to the fact that the consonants *c* and *g* have different pronunciations according to the vowel that follows them; but we may at least set *neu*, *seur*, *veu* for *neud*, *sœur*, *varu*. In the forms of *avoir* where *eu* represents a simple *u*, the latter should be substituted: *u* (participle), *us* (preterite), *usse* (imperfect subjunctive).

C. As to consonants:—All parasitical consonants—that is, consonants having no phonetic value, but used to point out a real or supposed etymology—are to be banished; so that for *corps*, *lacs*, *nid*, *doigt*, *poids*, *puits*, *sept*, *vingt* we should write *cors*, *las*, *ni*, *doil*, *pois*,

puis, *set*, *vingt*; the disappearance of *p* from *dompter*, *prompt*, and *temps* would lead to *donter*, *pront*, and *tens*, the old orthography. *Ll*, *rr*, *mm*, *nn*, *tt*, *pp*, *ff* coming before an *e* mute are to be represented by a single instead of the double consonant, except *ll* when it marks the *mouillure*. Double consonants before a sounded vowel should be kept when the pronunciation requires it—in *allocation*, *illuminer*, *belliqueux*, *courrais*, *irrationnel*, *commémorer*, *innocent*; but not in *allouer*, *coroder*, *acomoder*, *anniversaire* (for *allouer*, *corroder*, *accomoder*, *anniversaire*). *G* palatal, it is recommended, should always be written *j*: *manjer*, *manjons*, *obliger*, &c. *X* is to be abolished as a representative of the hard and the soft sibilant; in the former case *ss* is to be written for it (*soissante* for *soixante*). For the soft sibilant the universal employment of *z* is proposed (*case*, *extase*, *chaize*, &c.). In regard to the final sibilant, whilst *s* is kept in the second person plural (*chantes*, *chanties*), *z* should be put for *x* in *six*, *prix*, *croix*, and in the plurals of words in *-al*, *-ail*, *-au*, *-eau*, *-el*, *-eu*, and *-ou*.

D. As to scientific words derived from the Greek:—*I*, *t*, *f*, *r* are recommended as constant substitutes for *y*, *th*, *ph*, *rh*.

Even this partial harmonizing of spelling with pronunciation, if it be carried into effect, will prove an immense gain for teachers of French. But we are over-running our space. We conclude by calling attention to the continuous growth of secondary educational establishments in France. In boys' schools, according to the figures collected at the reopening, the gain has been 1,783 pupils; in *lycées*, 1,215; and in *collèges*, 568. In girls' schools there has been an increment of 3,840.

UNITED STATES.

We have often protested in this column against the treatment of truancy as a crime, and against all acts that tend to confound a school with a jail in the mind of the child. America furnishes us with a case that will drive home what we have said. At Vineland, New Jersey, a boy of thirteen, named Morris Mitnes, refused to go to school. Being arrested by a truant officer, he pleaded guilty, and was confined in the County jail until the Court competent to deal with him should meet. Among the inmates of the prison were two murderers and two women of bad character. The lad of thirteen, for disliking, perhaps not without cause, his school, was put in the same cell as a man who has since confessed that he murdered his wife. Popular indignation brought about his release under recognizances. But there is something wrong with the law in New Jersey, or with the spirit in which it is administered.

School clubs in which the older boys ape the customs of University students are common in Germany, and not unknown in America. A striking proof of their existence is reported from Chicago, where the Fraternities in the High School have declined to acquiesce in the order of the Board of Education bidding them suspend their activity. The boys actually got lawyers to represent them before the Courts, and Judge Hanecy has granted an injunction which forbids the Board to interfere with the Fraternities in any way. An appeal to the Supreme Court is to be made; but for the present youth is triumphant. School organizations and riotous politicians at Universities are two forms of evil from which education in England is happily free.

For those who still fear that we are being outstripped by the United States we reproduce the argument of the *Western Journal of Education* to the contrary. The best proof of a low standard of education in any State is the presence there of a large number of physicians and lawyers; for their business is to redress the wrongs and cure the diseases that education would prevent. Now a recent study shows that the United States has twice as many doctors in proportion to population as Great Britain, and four times as many as Germany; while of lawyers probably no country in the world boasts so abundant a supply. The inference is as obvious as it is flattering to ourselves and to Germany. It were sad to think, however, that teachers are labouring to exterminate two great professions. Yet haply there are ills for which learning is no remedy.

WESTERN AUSTRALIA.

The Report for 1903 of the Minister of Education shows a considerable addition to the number of children in the schools, the average enrolment being 24,532, as against 22,605 in 1902. The average attendance has also improved, being nearly 83 per cent. of the average enrolment—a result highly satisfactory when the climatic conditions and the distances that frequently have to be travelled are taken into account. As life on the goldfields becomes more settled, a greater desire to send the children to school becomes apparent; but everywhere boys, and still more, girls, are removed at too early an age. The growth of

(Continued on page 82.)

London: MEIKLEJOHN & HOLDEN, 11 Paternoster Square, E.C.

sporadic agricultural settlement causes an increase in the number of small schools, the Education Department endeavouring to provide school facilities wherever an average attendance of ten can be secured. This liberal policy naturally involves a large expenditure. The average salary of head teachers is now £172. 18s. 1d.; that of assistants is £131. 2s. 3d.; but "the salaries of the lower branches of the service still compare unfavourably with mechanics' wages."

Perhaps the most striking part of the Report is that which dwells on the necessity of employing well-trained and competent teachers, the lack of them being a source of constant anxiety and difficulty. The Department, clearly not enamoured of the pupil-teacher system, can only strive to make the best of it. We quote the statement of what is being done to relieve "monitors," and convert them into efficient teachers:—"Towards the end of 1903 central classes were established for the monitors in Perth and Fremantle. In future monitors in other parts of the State will be taught by correspondence with the instructors of these classes. The junior monitors, aged generally from fourteen to sixteen, will only be employed in the schools for four half-days each week, the rest of the time being devoted to their own education. Senior monitors will be employed in the schools for six half-days in each week. By means of a supplement to the *Education Circular*, the full programme of work for each month, with instructions and notes, is forwarded to every monitor in the State. This provision being made for the education of the monitors, they will need less elementary work when they enter the training college. The age of admission has therefore been raised, and the course shortened from three years to two. A larger number of trained teachers will be produced, and the college course can be more exclusively devoted to professional training. A practising school attached to the college thus becomes a more urgent necessity than ever, and it is hoped that this will be provided during the coming year. The college is doing good work, and the number of students is now larger than at any previous time."

VICTORIA.

A series of events, some humorous and some deadly serious, have combined to rescue Melbourne University from its financial and administrative troubles. The Victorian Government, convinced that the University managers are really about to mend their ways and bring *alma mater* into touch with the young colonial who has to make his way in the world, has undertaken to increase the endowment from £10,000 to £20,000 a year, and has allotted £12,000 for new laboratories and equipment on condition that private benevolence raises another £12,000. This decision has put new energy into the University, and has started an appeal which in a few days secured donations exceeding £3,000. There ought to be little difficulty in raising the remaining £9,000. The total private endowment of Melbourne University is only £90,000, yielding an income of about £3,000, whereas Sydney University has an endowment of £421,000, yielding £15,300 a year.

The price the University has to pay for further State subventions is a heavy one. It has to admit students to courses for diplomas in Mining and Agriculture without full matriculation; it has to take without fee at least eighty students from State schools in order that the sons of penniless democracy may compete on level terms with the sons of squatocracy and the Stock Exchange. And, finally, it has to accept a new constitution which secures to the State Government three representatives on the governing body (the Council) and places the selection of the remaining members in the hands of the University Senate.

DIRECTORY OF EDUCATIONAL ASSOCIATIONS.

THE object is stated only when this is not obvious from the title or not known by general repute. The following number gives the membership as far as ascertainable. Then follow the yearly subscriptions, the name of the Secretary, and office address.

Art for Schools Association.

£1. 1s. Miss M. L. Cooper, 46 Great Ormond Street, Bloomsbury, W.C.

Art Masters, Society of.

300. £1. 1s. Mr. Francis Ford, 50 Broomhouse Road, Fulham, S.W.

Art Teachers' Guild.

For teachers of drawing in schools. 2s. 6d. Miss B. Collins, Skinners' School for Girls, Stamford Hill, N.

Arts, Society of.

£2. 2s. Sir H. Truman Wood, 18 John Street, Adelphi, W.C.

Assistant Masters, Incorporated Association of.

Masters in secondary schools, both public and private. 1,650. 10s. 6d. Mr. C. J. Mackness, 27 Great James Street, Bloomsbury, W.C.

Assistant Mistresses in Public Secondary Schools, Incorporated Association of.

2s. 6d. Miss Macklin, 141 Inverness Terrace, W.

Associated Board of Royal Academy of Music and Royal College of Music.

Holds local examinations. Mr. James Muir, 14 Hanover Square, W.

Authors, Incorporated Society of.

£1. 1s. Mr. G. Herbert Thring, 39 Old Queen Street, S.W.

Board of Education Library.

St. Stephen's House, Cannon Row, S.W.

British Association for the Advancement of Science.

Dr. J. G. Garson, Burlington House, W.

British Child-Study Association.

3s. Miss Mary Louch, Prestbury, Gloucestershire.

Catholic Head Masters' Association (Ireland).

Very Rev. A. Murphy, St. Munchin's College, Limerick.

Catholic Secondary Education Council.

28 Ashley Place, S.W.

Central Welsh Board.

4 St. Andrew's Crescent, Cardiff.

Childhood Society.

For the scientific study of children. 10s. 6d. Mr. W. J. D. Mulford, Parkes Museum, Margaret Street, W.

City and Guilds of London Institute.

Sir John Watney, Gresham College, Basinghall Street, E.C.

Classical Association.

900. Dr. Postgate. 10s. 6d. Cambridge.

Classical Association of Scotland.

230. Mr. William Lobban, High School for Girls, Glasgow.

College of Preceptors.

Open to all teachers who possess University degrees or certain diplomas. 1,100. £1. 1s. Mr. C. R. Hodgson, Bloomsbury Square, W.C.

Conference of Catholic Colleges.

For heads of secondary schools governed by bishops or one of the religious orders. 30. Mgr. Ward, St. Edmund's College, Ware.

County Councils Association.

100. Mr. G. Montague Harris, Parliament Mansions, Westminster, S.W.

Deaf and Dumb, Association for the Oral Instruction of the, Training College and School.

Mr. William van Praagh, 11 Fitzroy Square, W.

Deutscher Sprachverein, Allgemeiner.

A literary association to promote the study of pure German. 500. 5s. Dr. L. Hirsch, 25 Gleneldon Road, Streatham, S.W.

Directors and Secretaries for Education, Association of.

£1. Mr. J. H. Nicholas, 10 Queen Anne's Gate, S.W.

Drawing Society, The Royal.

Mr. T. R. Ablett, 50 Queen Anne's Gate, S.W.

Education Committees, Association of.

200. Mr. T. Groves, Town Hall, Leicester.

Education Department, Scotland.

Dover House, Whitehall, and Parliament Square, Edinburgh.

Educational Institute of Scotland.

Mr. John Laurence, Old Monkland, Coatbridge.

Elementary School Work as a Career for Girls, Association for Promoting.

Miss J. Merivale, 4 Park Town, Oxford.

French Governesses in England, Association of.

18 Lancaster Gate, Hyde Park, W.

Froebel Educational Institute, The Incorporated.

Mr. Arthur G. Symonds, Talgarth Road, West Kensington, W.

Froebel Society.

Holds conferences and has a registry office. 5s. Miss Noble, 4 Bloomsbury Square, W.C.

(Continued on page 84.)

OXFORD UNIVERSITY PRESS.

Books Set and Suitable for the College of Preceptors' Examinations, 1905.

Shakespeare. Edited by W. ALDIS WRIGHT. **Julius Caesar**, 2s. **Twelfth Night**, 1s. 6d.

Scott.—Lay of the Last Minstrel. Edited by W. MINTO. Second Edition. 1s. 6d. Separately, Introduction and Canto I. 6d.

Concise French Grammar, including Phonology, Accidence, and Syntax, for use in Upper and Middle Forms. By A. H. WALL. Crown 8vo, cloth, 4s. 6d.

Oxford Modern French Series. Edited by LEON DELBOS, M.A. Crown 8vo, cloth. The first Eight Volumes are the following:—LAMARTINE'S "Deux Héroïnes de la Révolution Française," 2s. 6d.; BALZAC'S "La Vendetta" and "Pierre Grassou," 2s.; VICTOR HUGO'S "Bug-Jargal," 2s.; SANDEAU'S "Mademoiselle de la Seiglière," 2s. 6d.; CHATEAUBRIAND'S "Mémoires d'Outre-Tombe," 2s. 6d.; KARR'S "Voyage autour de mon Jardin," 2s.; GOZLAN'S "Le Château de Vaux," 1s. 6d.; "Extraits des Voyages d'Alexis de Tocqueville," 2s.

Tales of the Roman Republic, PART I. Adapted from the Text of Livy. By J. B. ALLEN. Extra fcap. 8vo, paper boards, 1s. 6d.

Caesar.—The Gallic War. BOOKS III–V. Edited by C. E. MOBERLY. Extra fcap. 8vo, cloth, 2s. 6d.

Horace.—Odes, Carmen Saeculare, and Epodes. By E. C. WICKHAM. Second Edition. Crown 8vo, cloth, 6s.

Virgil.—Aeneid. BOOKS I–III. By T. L. PAPILLON and A. E. HAIGH. Crown 8vo, stiff covers, 2s.

Euripides.—Hecuba. Edited by C. B. HEBERDEN. Extra fcap. 8vo, cloth, 2s. 6d.

Xenophon.—Anabasis. BOOK I. By J. MARSHALL. 1s. 6d. BOOK II. By C. S. JERRAM. 1s. 6d. BOOK III. 1s. 6d. BOOK IV. 1s. 6d. BOOKS III and IV, together. 3s.

Each volume has the full Vocabulary bound up with it; the Vocabulary can also be had separately for 1s.

Manual of the Four Gospels. By the Rev. T. H. STOKOE. With Maps. Crown 8vo, cloth, 3s. 6d. Or, separately, PART I, The Gospel Narrative, 2s.; PART II, The Gospel Teaching, 2s.

Manual of the Acts of the Apostles. By the same Editor. 3s.

School History of England to the Death of Victoria. With Maps, Plans, and select Bibliographies. By O. M. EDWARDS, R. S. RAIT, and others. Crown 8vo, cloth, 3s. 6d.

Historical Geography of the British Colonies. By C. P. LUCAS, C.B. Crown 8vo.

Introduction. New Edition by H. E. EGERTON. 1903. With eight Maps. 3s. 6d. In cheaper binding, 2s. 6d.

Vol. I. The Mediterranean and Eastern Colonies (exclusive of India). With eleven Maps. 1888. 5s.

Vol. II. The West Indian Colonies. With twelve Maps. 1890. 7s. 6d.

Vol. III. West Africa. Revised to the end of 1899 by H. E. EGERTON. With five Maps. 7s. 6d.

Vol. IV. South and East Africa. Historical and Geographical. With eleven Maps. 1898. 9s. 6d.

Edward Stanford's Publications.

STANFORD'S "LARGE" SERIES OF SCHOOL WALL MAPS.

Stanford's "Large" Series includes Twenty-one Maps in all. The Maps are extensively used in Public and Private Schools throughout the British Isles and the Colonies, and have gained the Highest Awards at the great Exhibitions.

LIST OF SERIES:—

The World, Mercator
Eastern Hemisphere
Western Hemisphere
Europe
British Isles
England and Wales
London
Scotland
Ireland
Asia
Holy Land

India
Africa
North America
United States
South America
Australasia
Victoria (Australia)
New South Wales
New Zealand
British Possessions
(on a uniform scale)

SPECIAL FEATURES:—

**BOLD,
CLEAR,
ACCURATE,
ATTRACTIVELY COLOURED.**

Size, 50 by 58 inches. Price, Mounted on Rollers and Varnished, 13s. each.

Prospectus post free on application.

NEW OROGRAPHICAL MAP OF EUROPE.

Compiled under the direction of H. J. MACKINDER, M.A., Reader in Geography in the University of Oxford. Size 60 by 54 inches: 53½ miles to an inch (1:4,000,000). Price, Coloured, Mounted on Rollers, and Varnished, 20s.

This Map is primarily intended to depict the physical features of the Continent, but by the employment of the device of grey, almost transparent, lettering, many names have been inserted without spoiling the graphic effect of the colouring. The contour lines have been drawn at the same intervals above and below the sea level.

JUST PUBLISHED.

NEW OROGRAPHICAL MAP OF LANCASHIRE AND CHESHIRE.

Reduced from the Ordnance Survey, by E. G. W. HEWLETT, M.A., and O. E. KELSEY, M.A.

Size, 42 by 60 inches. Scale, 2 miles to an inch (1:126,720). Price, Coloured, Mounted on Rollers, and Varnished, 15s. net.

A graphic representation of the physical features of the area covered. County Boundaries, Railways, Canals, Rivers, are all laid down, and the principal towns and cities shown by symbols which enable the student to discern at a glance the approximate populations.

Prospectus gratis on application.

JUST PUBLISHED.

STANFORD'S GEOLOGICAL ATLAS OF GREAT BRITAIN.

WITH PLATES OF CHARACTERISTIC FOSSILS.

By HORACE B. WOODWARD, F.R.S., F.G.S.

Comprising 34 Coloured Maps, and 16 Double-page Plates of Fossils, with 149 pp. of text, illustrated by 17 Sections and Views. Crown 8vo, cloth, price 12s. 6d. net. (Postage, 4d.)

"This is a remarkably interesting and useful book."—*Glasgow Herald*.

OUTLINES OF GEOLOGY. An Introduction to the Science for Junior Students and General Readers. By JAMES GEIKIE, LL.D., F.R.S., Murchison Professor of Geology and Mineralogy at the University of Edinburgh. With 400 Illustrations. Fourth Edition. Large post 8vo, cloth, price 12s.

THE STUDENT'S HANDBOOK OF STRATIGRAPHICAL GEOLOGY. By A. J. JUKES-BROWNE, B.A., F.G.S., late of the Geological Survey of England and Wales. Illustrated with Maps, Diagrams, and Figures of Fossils. OCCASIONAL NOTES.

THE Incorporated Association of Head Masters mean business, and are not content, like their elder brethren, to shelve every question by referring it to a committee.

The I.A.H.M.
Meeting.

Points for discussion are carefully sifted and considered beforehand, and the increasing bulk of the annual report shows multifarious activity throughout the year. To our minds the most important issue before them this year was the examination scheme of the Consultative Committee. The principle of a central representative Board of Control was, we are glad to see, approved; but we regret that, in spite of Mr. Wells's protest, the wisdom of Polonius and the catchword "not to brand your own herrings" prevailed. The attitude of the Conference towards pupil-teachers was liberal and democratic in the best sense of the word, and the suggestion that masters should endeavour to enlist elementary teachers among their own pupils is most valuable. The resolution on Greek was, on the other hand, disappointing. The Conference is already committed to the rejected Oxford proposals, that candidates for Honours in Science and Mathematics should be excused Greek, but the compromise that the moderns should be offered a new degree, equivalent in all respects to the old, seems to us illusory. Historically "Arts" includes Mathematics and Science no less than Language and Literature. If the offer is *bona fide*, let the classicists leave the old degree to the moderns, and content themselves with B.Q. (*quadrivii*) or any other letters they may prefer.

WE must wait at least another month for the annual report of the Registration Council; but there is one point on which we may invite a preliminary discussion.

Let us assume that Column A, which has never come into existence, is abolished, and ask what should be the minimum qualification for the registered teacher. As to training and experience, there is not likely to be much dispute; but are we to insist on the academic qualifications at present imposed by the permanent Regulations? In this case we should exclude for many years to come at the least half of the acting secondary teachers, and virtually for all time, perhaps, the most capable section of the profession—kindergarten teachers. This seems to us a *reductio ad absurdum* of a Register, and the alternative remains—either to divide Column B into two parts: teachers with and without a University degree; or to form a single Register with a low academic qualification, on the ground that different ranks will be sufficiently discriminated by the particulars entered against each name. The precedent of the Medical Register is in favour of the latter alternative; but, for the present, we leave it an open question.

PROF. RAY LANKESTER'S letter of January 4 to the *Times* has proved a godsend to the classical head masters, who, to borrow a Platonic simile, have mouthed it like puppies. Prof. Lankester was ever a fighter: he is always dragging his coat-tails, and still has a boyish delight in "getting a rise." But, to take all his provocation seriously, as did Mr. Moss, shows a lack of humour, and his main argument, when stripped of personalities, seems to us irrefutable. The classics have for generations enjoyed an undisturbed monopoly in our public schools, and this monopoly is on the verge of extinction. The rudiments of Greek, which is all they have hitherto taught to three-fourths of their pupils, cannot be reckoned as an initiation into Greek literature, history, and art. In a second letter, Prof. Lankester shows that the amenities of controversy are not confined to one side. Nothing could be happier than his reference to Dr. James on the golf links as a sufficient refutation of his alleged aspersions on head masters for laziness.

ONE of the most noteworthy events of the month was the announcement that the Board of Education had decided to permit the municipalization of the most important of the secondary schools of Reading. If the scheme is carried out, Reading School will be the first public school to be controlled by the public as represented by a municipal body. The proposal is that one Sub-committee of the Education Committee shall manage all the schools. We have always held that there is room in this country for many different methods of management and control of secondary schools. The result of the Reading scheme will certainly be watched with great interest, and the policy of the new Authority on such questions as the tenure and salaries of assistant masters will be awaited with anxiety by masters throughout the country.

WE cannot congratulate Mr. Sydney James on his logic. In the *Times* of January 26 he argues thus:—"The united pressure of parents and boys is all in favour of useful and easy subjects (by a kind dispensation of Providence these are synonymous); and, unless the Universities throw their weight into the scale of the Head Masters, who count for least, "Greek will shortly be, as regards the number of learners, on a level with shorthand and below carpentry." Surely, if pushful parents and lazy schoolboys are the dominant factor

in determining subjects, classes in shorthand and carpentry should be the most, not the least, numerous. Further, Mr. James informs us that, of his 490 pupils at Malvern, there are only 12 (the science class) to whom Greek would be of no use. If this be so—if, as he contends, all but 2 per cent. of public-school boys ought to be taught Greek—his proposal to create a new degree for the benefit of these derelicts is either fatuous or ironical.

EVERY one, from Mr. Acland down to our office boy, is fully convinced of the necessity of further funds to maintain secondary education. The one obvious source of supplies that is at present barely tapped is the parent's purse—a source almost entirely neglected by Local Authorities. Last month we drew attention to the action of the Board in sanctioning fees of 30s. a year in the case of the New Mills Secondary School, with the intimation that the fees must be doubled at the end of the year. Even an annual fee of £3 seems to us unreasonably low. At Worcester the Victoria Institute Secondary School is charging a fee of 13s. a term, and the Board has desired that the fee should be raised to £3 per annum. We wish the Board would insist upon fees of £10. A few years ago £6 was looked upon as the lowest permissible sum. Now the Board seems to have made up its mind, under pressure from Local Authorities, to allow only half that sum to be charged, and we dare not venture to think what may be the result of further pressure. None who know *The Journal* will charge us with social exclusiveness when we say that, if the fees are not at least £6 per annum, the school ought to be made into a higher elementary school. The need of poor parents can be adequately met by scholarships.

THE Head Mistresses, bolder than their colleagues in boys' schools, issued a scheme of salaries on which we commented last month. It is a good and reasonable move to make. The Head Masters seem to doubt the expediency of saying how money which is not yet in the exchequer should be spent. It does not appear to be our part to tell the governors where to find the money: it is for head masters and head mistresses, who are the expert advisers of governing bodies, to give an opinion as to the reasonable minimum for which adequate service can be secured. The Head Masters have gone no further than to state that no qualified man should be appointed on less than £150. The Head Mistresses propose a minimum of £105 to £120 for the probationary year. The Assistant Mistresses are not quite content with this, and propose £120 as the minimum, rising by annual increments of £10 to £140, and subsequently by £5 a year up to £200 for graduates. The final maximum is sufficiently elastic—£300 or more. The figures are not unreasonable. But it is a pity they do not coincide entirely, as they do mostly, with the scale of the Head Mistresses. The suggestion has, of course, been made that women should receive equal salaries with men; but we are glad this view is not pressed. Although woman may do work of precisely equal value, economic conditions make it futile at present to expect equal payment.

THE President of the Board of Education has appointed Mr. T. S. Dymond to an Inspectorship under the Board, and to act as a special adviser in matters of rural education; of Nature study in public elementary schools; of agricultural instruction in evening schools; and of the advancement of technical education in rural districts. Thus runs

the official announcement, and we hope it means the gradual transference of the educational work of the Board of Agriculture to Mr. Morant and his staff. The Board of Agriculture has done excellent work in helping institutions and in encouraging localities. Its recently published report shows that nearly £10,000 has been spent during the year in aid of various colleges. A section of the report is devoted to education in rural districts, and a return is given of the agricultural work of the County Education Authorities. Mr. Dymond has had already a wide experience in matters of agricultural education, and it is likely that he will be able to do a very useful work at the Board of Education. We have had inquiries and Nature-study exhibitions in plenty. We now want the information gained and the experience acquired to be made readily accessible. This must be Mr. Dymond's work, and it is to be hoped that the Board of Agriculture will courteously hand over their grant and retire from the field.

WE trust that the criticisms showered upon the scholarship scheme of the London County Council will induce that body to reconsider the proposals contained in the Committee's report. The delay that will result from referring the matter back is regrettable, but the scheme is too colossal to be rushed through in a hurry. The good points in the report refer to the selection of candidates, and need no amendment. These are details with which the Council has little concern: they are rightly left to the Council's expert advisers. But, on the face of it, the scheme is given away by the mere statement that the girls outnumber the boys in the proportion of two to one. The objector may well say, here is a plan to secure to the capable children in the elementary schools a chance of continuing their education in a secondary school, and you ask me to believe that there are twice as many girls as boys whom it will pay the State to educate at the public cost. The cat is let out of the bag. There is a dearth of teachers: women teachers are said to be in the proportion of five to one, and the proportionate number is on the increase. London has had laid upon it the duty—in connexion with the Central Authority—of training teachers for its schools; but London has also the duty and privilege of helping the children of its poorer citizens to get the best education possible for all walks in life where capacity can be made to subserve the needs of the State. Since the above was written the Council has again met and adjourned the discussion.

THE sceptic is often inclined to ask: Shall any good thing come out of London? London is so vast that no one yet has diagnosed its hopes and aims. The nervous energies of London are too numerous to be controlled by any single ganglion. Northerners call Londoners "slack," and there is truth in the charge; yet London has a way of attracting to itself much of what is best everywhere. This philosophic mood is evoked by the news from Liverpool that no fewer than two thousand people were present at the North of England Conference, which has just been held. We have our conferences in London; but we are used to count our attendances by hundreds or fifties, or even by tens. If there is any excuse to offer, it lies in the multitude of our opportunities. The Liverpool meeting was undoubtedly an important one, and did not fall short of its two predecessors in interest and in the power of attracting the educationally great. It is an old charge that educational reformers are too prone to talk. But discussion clears the air as nothing else can do. And it does more:

Higher Fees.

Assistant Mistresses want more.

The Netting of Teachers or of Capacity.

Talk a necessary Preliminary to Action.

Education or Agriculture.

it prepares the ground and sows the seed ; so that the reform, when it comes, does not fall upon barren soil. Experience proves that reforms promulgated from above may have no result, because those who are to be reformed are taken by surprise and are unable to rise to the occasion. We school-masters do not obey orders blindly ; we demand that our judgment shall be convinced. To this end conferences are of no small avail.

THE importance of the Teachers' Guild at the present juncture in educational affairs cannot well be overestimated. It is the one association that brings together teachers of all grades. The increase in number and strength, during recent years, of sectional bodies has produced many valuable results. We would not have it otherwise. But such associations inevitably suffer from the defects of their qualities. More than ever just now the need is for a common platform on which all grades of teachers, from the elementary school to the University, can meet. On this subject Mr. Sadler's Liverpool report contains an interesting paragraph. It runs :

The smooth working of the educational system of a great city largely depends on there being friendly personal relations between the different groups of teachers. In this connexion, therefore, mention should be made of the useful part played by the Liverpool Teachers' Guild, which has brought together many who, though interested in the same subjects, might not otherwise have met, and led to friendly interchange of opinion between those whose work lies in the University and the teachers in the primary and secondary schools.

SIR WILLIAM ANSON gave his Wakefield audience a *résumé* of the educational progress that has been rendered possible and has been carried out under the terms of the recent Education Acts such as should suffice to convince unbiassed men ; and he ended with a powerful appeal for toleration in the matter of teaching religion in elementary schools. Alas, that it should be so ! But this is the one topic on which an audience is not amenable to reason. And even Sir William does not advance matters when he asserts that every parent has a right to obtain for his children that form of denominational teaching which he prefers. The Church of England covers the country fairly well with its schools ; but of no other religious body—except, possibly, the Roman Catholics—can this be predicated. To say, then, that every child in the elementary schools should be taught its own creed is little more than a form of words. The real trouble is that the Church of England is in a specially favoured position in this respect. Intolerance is not so fierce as it has been in times past, but it still has to be reckoned with. The alternatives are either to endow all bodies equally or to endow none.

SOME little time ago we were glad to welcome the announcement of the French Minister of Education that a certain number of Englishmen would be admitted into French *lycées* for a period of a year as student-teachers. The Englishman, in return for two hours' teaching to boys wishing to practise English conversation, is given board and lodging in the *lycée*. The rest of the day the Englishman is presumed to enjoy opportunities of French conversation. This presumption may not always be easy of realization. A Frenchman suddenly plunged into the life of a big English boarding school would certainly find some opportunity of mixing with the boys in the playing fields, and he would find a certain amount of social life in the masters' houses

after 4 p.m., and possibly also in the evening ; but he would spend many solitary hours. In a town day school the position would be a very dull one. In a *lycée* this difficulty is accentuated. The masters have little or no share in the pursuits of the boys : they are more like University lecturers in England. They come down to their classrooms, give their lessons, and are off back to their suburban flats. There is no social life in a *lycée*, and the lot of the young Englishman may be very dull and very profitless.

ANOTHER point is that our young Englishman fondly hopes to earn some pocket-money by giving private lessons in his own language. But it is well known that masters in French secondary schools largely supplement their incomes by giving private lessons, and it may be, therefore, surmised that their attitude towards a rival will not be very helpful. It is true that there is also in the *lycées* a sort of usher known to the boys as *pion*, and to the administration as *répétiteur* or *surveillant* ; but he takes no share in the teaching and stands on quite a different footing from the rest of the staff. Such men are concerned entirely with the supervision, and are scarcely available for companionship. It would be regrettable if the plan failed because there was found to be no adequate return in fluency of conversation for the year's time given. Nothing is further from our intention than to pour cold water on a promising scheme. Our object is to urge on our countrymen the necessity, especially at the start, of taking pains to ensure that any Frenchman sent over to England on similar terms should have full opportunities of joining freely in the social life of the school.

WHEN the dust of the Greek controversy has settled we may, perhaps, decide to introduce certain reforms in language teaching that have long been crying aloud for adoption. These may be summed up in the phrase "Advance from the easy to the difficult." The mother tongue is obviously the easiest. Let us begin with that, and not with the Latin declensions, which some misguided persons still believe in as an introduction to linguistic study. At the age of nine, or thereabouts, the French language may be started and continued, with a daily lesson for three years. Not until the age of twelve must the future classicist begin the study of Latin. At this age Latin will be the principal language, and, if time is wanting, the French hours must be curtailed. Given good teaching—which will not be lacking for want of good advice—and the boy of fourteen will possess a sure knowledge of French and a useful grounding in Latin. He is now in a position to "keep up his French" by giving comparatively little time to it ; to continue his Latin steadily, and to make a serious start in Greek. These reforms are not new, and doubtless in some few schools they are the order of the day. But, if they were generally acted upon, we are sure that ten years would show an immense tale of progress. The pity is we have no means, in England at least, of enforcing a necessary reform on all and sundry.

THE Classical Association has appointed a committee to consider the question of the pronunciation of Greek and Latin in schools. Mr. Winbolt, a former hon. secretary of the I.A.A.M., has written to the *Times* to impart some useful information that the association has been collecting for the last four years. So far as can be discovered by inquiry a large proportion of assistant masters is in favour of a reformed

pronunciation based on the pamphlet of the Cambridge Philological Society. Such news raises a hope of possible progress in the matter; but there is no disguising the fact that reform will be very slow and very difficult. Further, we ought not to rest content until the whole educated world is agreed upon a common pronunciation. The one feasible standard already existing—that of the priests in the Catholic Church of Rome—is naturally rejected by the scholars of an age of accurate historical research. It will take years, if not generations, to come to a common agreement in this matter. In the meantime, as Mr. Punch suggests, why not extend the privilege of British pronunciation to French and German so that schoolboys may say: “Allezz-vowse-enn,” and “Jay, itch haybe jenugg”?

IT does not require a deep philosopher to discover how easily and readily a nation or an individual is corrupted by a system of doles. Free education looks as if it were to become the forerunner of free meals and free clothes. The loafer always prefers to wait feebly for philanthropic aid rather than make an effort on his own account. It is to be hoped that the scholastic profession is not yet demoralized to this extent. The abolition of fees for elementary education, the lowering of fees in intermediate schools, the large increase in State grants, the unanimous cry from Local Authorities for increased aid in behalf of training colleges—all these seem to have aroused the idea that the State is a benevolent parent whose pockets are to be picked by a mixture of cajolery and playful force. The pernicious and illusory notion is abroad that because the State pays two-thirds of the cost of training the primary teacher it ought to do at least as much for the secondary teacher. By an insidious and indirect wind this result might be reached if teachers trained in elementary colleges were permitted to teach at once in secondary schools without being considered to have broken the pledge given to the State. If the *status* of a teacher in a secondary school is ever to be one of dignity and weight, he must prepare himself at his own cost for his profession; under any other circumstances salaries will indubitably be lowered, with a corresponding lowering in the position and the power of the teacher.

MR. ARNOLD-FORSTER presided, on January 16, at the inaugural lecture by Colonel Sawyer to the Army Class of the University of London, an account of which will be found elsewhere, and took occasion to address a note of warning to the public schools. “He was not altogether satisfied that the candidates who came from the public schools had the ordinary average of education that a cultivated English gentleman at that period of life ought to possess.” The Army was not to be regarded for all time as the preserve of the public schools. He hoped that the proposed school certificates which all the wisest head masters were encouraging (rather hard on Mr. Eve and Mr. Lancelot!) would afford some guarantee of efficiency, but he announced that he was seriously contemplating the establishment of a Government Army School on the lines of the Royal Osborne College for the Navy or the West Point College of the United States. All we would remark is that criticism, like charity, should begin at home. We doubt much whether a special Army school is likely to develop that general intelligence in which our officers have been found most lacking. Assuredly it must not take as its model for teaching, discipline, and economy either Woolwich or Sandhurst.

WHY does the University of London pursue the bad practice of publishing examination papers together with the names of the examiners? In the case of external students there is some justification. These are without guidance in their studies, and a perusal of previous papers may, to a certain extent, direct them in their reading and point out the kind and amount of knowledge that will be required of them. Even in their case we incline to think that the loss is greater than the gain. Quick tells the story of the pupil who in getting up the second book of “Paradise Lost” had skipped the speeches of Belial and Moloch “because they were set last year,” and the crammer’s tips to his pupils are founded on a careful scrutiny of the published papers. But in the case of internal students there is nothing to plead in favour of publication. The University is responsible for the teachers of internal students, and it should delegate to them the whole responsibility of conferring or withholding diplomas and degrees. As it is, it wastes on a complicated system of examination and a whole army of examiners funds that should be expended on teaching and research.

A SERIOUS difficulty in the way of a reconstituted College of Preceptors which shall combine all associated bodies of secondary teachers has not, so far as we are aware, been yet considered. As was announced at the annual meeting of the Assistant Masters, it is proposed that the Federated College shall have an organ of its own, the *Educational Times* (or its successor) with supplements giving the proceedings of the constituent bodies, on the model of a parish magazine. But who is to edit or dictate the policy of the common journal? Will head masters and assistant masters always see eye to eye? The question of school certificates, which has just been debated by four of the constituent bodies, furnishes a test case. The Committee of the I.A.A.M. is of opinion that “the proposals are admirable.” The Council of the College of Preceptors sees no reason why “existing general examinations should be superseded by a new scheme,” and the leading article of the *Educational Times* expresses the hope that “the Board of Education will hesitate before adopting a revolutionary policy.” On the question of compulsory Greek there was the same disagreement between heads and assistants. It would require a *Standard* editor to harmonize or hold the balance between these diametrically opposite views.

HOW is a woman who has taken Honour Schools at Oxford or one of the Triposes at Cambridge to add the magic letters B.A. or M.A. to her name? Up to a few months ago the problem was insoluble; but now Trinity College, Dublin, has solved the riddle, and demands the modest sum of £10 (£10 additional for the M.A.) for communicating the answer. In plain English, any woman possessing the equivalent of an Oxford or Cambridge degree will be admitted to an *ad eundem* for that fee. As with the *Times* subscription, there is a time limit affixed, and the offer ceases in 1907. Can the offer be intended as a practical retort to Dean Mansel’s epigram written when it was proposed to admit Trinity graduates to an *ad eundem* Oxford degree?—

When Alma Mater her kind heart enlarges,
Charges her graduates, graduates her charges,
What safer rule can guide the accountant’s pen
Than that of doubling fees to Dublin men?

A PLEA FOR THE USELESS.*

By W. H. D. ROUSE.

THE schoolmaster resembles Ruskin's bent labourer who doles out turnips to the lords of creation and finds himself left at the day's end with half a turnip to munch. "Even the books I have written, and on the score of which I might modestly crave a turnip, have never paid their expenses. So my publishers assure me, and they ought to know."

And this is an eminently useful age: nothing ineffective is tolerated. None of the officers in the British Army is useless. None of our Ministers but is prompt, courageous, and efficient. Every bishop knows his own mind and impresses it on the humblest of his clergy. Lawyers care for nothing but the despatch of justice, and "the law's delay" is an obsolete phrase which will need a note in the Clarendon Shakespeare. Schoolmasters who cannot teach shorthand and type-writing, or, at least, win open scholarships, are soon asked to move on.

It is useless to teach history—so, at least, our statesmen think—and they should know, for they make history; so think our soldiers, who unmake it, and our divines, who defy it. Yet as we glance back through past history we find one or two nations who know what usefulness is. The Phoenicians, and their branch the Carthaginians in particular, had an eminent sense of the useful. But it is strange how little they have left behind—our alphabet, which they borrowed from Egypt, and a series of worked-out tin and gold mines, with the memory of their unique remedy for inefficiency—crucifixion of the inefficient. But this remedy proved too drastic for modern needs and a pension is substituted. The two personages whom we remember out of this great race are Dido, who actually died for love—a most useless thing to do, when she might have married Iarbas—and that inspired visionary Hannibal, to whom it must have been small consolation in failure to know that he was the greatest captain of all time. And Dido's story was written by one Virgil, a most impractical scion of a practical race, who actually spent eleven years in composing a poem, and then wanted to burn it because he felt his work had been useless. He was dying at the time, and, as he could not burn it himself, his friends thought it would be useless to take the trouble. Hence his work has survived, and has been the cause of much useless labour, and still more useless imitation, on the classical side.

But of all the useless nations that cumbered the earth commend me to the Jews and the Greeks. The Jews never knew when they were well off. In Goshen, amidst peace and plenty, with only a few humble necessary tasks to do, such as building pyramids, they will not rest, but start for a forty years' tramp in the wilderness. In the fertile plains of Babylon, under a benevolent despot, they do nothing but sulk and sing psalms till they are allowed to go back to their own land. And those prophets of theirs! Instead of prophesying smooth things, and so making things comfortable all round, they must needs denounce their kings and call them bad names.

And the Greeks who besieged Troy for ten years because some one's wife had run away, and then for hundreds of years sat still and listened to the useless tale! And their plays! There is some use in a play like "Charley's Aunt," which fills the pockets of playwright and manager; but, as far as I know, the hundred dramas of Aeschylus and Sophocles never put an obol into any one's pocket.

Who would not rather be Jacob than Esau? Yet, stay, it was Esau who wanted that mess of pottage. Jacob is not a good example for us. He was indeed a shrewd man of business, who knew how to make even peeled willow-wands useful; everything he touched turned to sheep. But there was a weak spot in Jacob. He must needs go and fall in love, and that, too, not with his master's eldest daughter, the obvious thing to do, but with a chit of a girl whose face was her fortune. There must have been something unbusinesslike in a man who could serve fourteen years for a girl who was by that time no chicken. Esau, too, was weak. He might have repudiated that bargain which came very near the line even for a shrewd business man; and afterwards, when he had Jacob in the hollow of his hand, he might have made an end of him, and taken flocks and herds

and wives also. But no; the silly fellow preferred his brother's loving hug and a few soft words—market value not one groat.

We all have our weak side. A great many men read poetry, though it is not worth an ounce of tea or a bottle of beer. Poetry is the only thing that the Germans do not dump in this country. If there were any money in it, they would long ago have started a manufactory and imitated our Shakespeare trademark.

And yet, after all, we live not on turnips alone, but on aspirations and hopes. The other day an old schoolfellow of mine, whom I remember thirty years ago in India, wrote to me, giving a London address. I sought him out and found him living in a garret and gaining his living by selling newspapers in the street. It was a bitter cold day when we met. My friend had neither gloves nor overcoat. I was full of pity at the sight of him. I asked him to dine, but he declined; he neither smoked nor took wine. What he wanted was a long talk with me on universal peace and brotherhood. He believed that he had found the secret. When I left my friend that afternoon I envied him. He is the happiest man I know.

This is what always comes before my mind when I hear people talking about education. We are told in every paper, from the *Times* to the *Daily Mail*, that the great problem is to keep our trade. No; that is not the great problem, but how to keep our souls alive. The problem of education is not how to teach a boy or girl to earn his living, but to show him how he may avoid spoiling himself whilst he earns his living. Plato knew this when he distinguished between the artist and the artificer, the mere wage-earner. Fancy your successful business man with Plato's fortune set down in the suburbs of Athens. He would set about making a corner in olive oil and plaster the Parthenon with his advertisements.

And thus it is that when I hear arguments against "compulsory Greek" I think of the man with the muck-rake in "The Pilgrim's Progress." Compulsory life, compulsory beauty, compulsory happiness! Are not such phrases absurd? Compulsion ought to be needed in order that we may earn money. If any person with a living soul needs compulsion to learn Greek, there must be something wrong with the way he is taught. Grave and reverend signiors observe that the water is not clear: they advise us gravely to cut off the supply. But why not first try what can be done by clearing the pipes? Without water, without Greek, we cannot live.

Yes, that is what Jacob would have done if he had lived now. He would have gone to Padan-aram in his motor and splashed the mud of Edom over Esau.

MONSIEUR L'INSPECTEUR.

C—, France, June, 1904.

FOR the last month we have lived in continual suspense as to the whereabouts of M. l'Inspecteur Général and the likelihood of his visiting the school. Numerous preparations have been made for this much dreaded visit: both mistresses and girls have repeatedly been warned to prepare their lessons with special care; Madame la Directrice has appeared on the scenes at a remarkably early hour every morning in order to superintend the pupils' dusting and sweeping; visions of youth laden with pails and brushes have been seen tearing round; geraniums have been put in the most prominent flower beds; faces are visibly growing thin and careworn, and Madame dons her company dress every day—a magnificent black, with a bright yellow satin top.

And so the weeks pass by, and yet no Inspector arrives. One morning, however, great excitement is caused by a rumour that "He" is there—one very wet morning when Madame has neglected to get up early, feeling sure that all is safe for *this* day, at any rate. A message is sent from one of the hotels in the town at 8.20 a.m. to say that "He" is there. The *concierge* wildly tears round the house, as never mortal tore before, to warn the mistresses and give them time to prepare in hot haste a lesson. "Il est là!!" "Qui?" "Il, il est là, sur le trottoir!!" O quelle scène, mon Dieu!! Wild confusion reigns: Mlle. X. flies round, urging the girls to do their *charges* again; Mme. Y., the housekeeper, joins the throng and discovers that there is a curtain missing in the dormitory

* Abridgment of Paper read before the Assistant Masters' Association.

(despite the fact that it has been missing for months). It is accordingly tacked up. Mlle. L. bursts into floods of bitter tears at the very thought of giving a lesson before "Him"; doors are banged, little feet fly round in every direction, excitement lends strength to little hands.

Consternation is printed on the faces of the mistresses (no less than on those of the pupils) when the 8.30 bell for school rings and they begin the lessons so carefully prepared and saved up for "Him."

They tremble with fear, awaiting their doom. But where is "He"? Why, at the *lycée*, with no intention of visiting the school this morning. A false alarm—"quelle blague," "sur le trottoir," indeed!

What a relief for Madame!—for is not this the only day on which she has slept late, and is it not a pouring wet day? Oh! never again will she continue her slumbers so late! Therefore she is up with the lark the next morning, exhorting the dear "lambs" to be very careful over their *charges*; people are mustered in to scrub; the entire dormitory and passages are scrupulously cleaned; the *concierge* is sent into the town to buy new American cloth for the refectory tables; the floor of the said refectory is washed; the garden beds are raked; and there is even a rumour that the small hunchback gardener himself has been ordered to take a bath. At any rate, an unmistakable sound of vigorous ablutions proceeds from the windows of the *salle de bain*—and how much more can one know?

Ah! what devotion! Never was an establishment so spotlessly clean!

But the Inspector does not come, and by degrees folks get into "inspector régime." The mistresses repeat the prepared lessons every day; Madame continues to get up early, but, out of consideration for the yellow satin, has adopted a large mustard-coloured pinafore; the poor little hunchback is given a bath daily, and is growing unrecognizably clean! Madame's smile is at full cock; brooms and cloths are always at hand; the girls are continually warned, and the rumour is often spread that "Il est là!"

But I am obliged to leave the school and return to England.

Whether he ever came I know not. For me the school is pictured, like Keats's "Grecian Urn"—a monument of arrested expectation.

K. M. J.

TEACHERS' GUILD NOTES.

[By a resolution of the Council, of June 19, 1884, "The Journal of Education" was adopted as the medium of communication among members of the Teachers' Guild; but "The Journal" is in no other sense the organ of the Guild, nor is the Guild in any way responsible for the opinions expressed therein.]

ON February 2 the Council will have to consider the outcome of the Congress of Officers of the Guild held on January 13. On their decisions much will depend. Clearly, the new programme put forward by the Council met with general approval. The Chairman, supported by the Vice-Chairman, explained the reasons for setting in the front of all other questions the remuneration and tenure of teachers. It is probable that the Guild will press actively for the following reforms, in the case of secondary-school teachers:—(1) The selection of the teacher to be made by the head of the school, and the formal appointment by the governing body after a reasonable probationary period. The dismissal to be by the latter, after sufficient cause shown. (2) An appeal to lie to the Board of Education, or, failing it, to the Local Authority, or the governing body. In the case of the dismissal of the head of a school, to one of the two former. (3) No dismissal to be made after a certain number of years' service without a pension. The Chairman urged that an assistant teacher should not be regarded as the private servant of the head, but as a servant of the community.

An initial salary of £150, with annual increments, for fully qualified men teachers in secondary schools is likely to be demanded by the Guild and other associations. The Association of Assistant Mistresses, recognizing facts which are stronger than logic, puts the initial figure for fully qualified women teachers in secondary schools at £120, also with regular increments. It was felt that the Guild, as representing the profession generally, can best press for these improvements without the suspicion of trade-unionism, on the ground that an under-

paid profession, struggling against the drawbacks attaching to a less than living wage, in many cases, cannot realize the educational aims of the nation, and will tend more and more to become depleted of first-rate talent. The profession must show that more important than splendid school buildings is a supply of highly qualified teachers—men and women of character and intellectual strength, and that a better ratio between the outlay on the one and on the other element in education should be established. It is for statesmen to find the funds to secure the desired improvement, when once the public has realized the danger. It is our duty to prove that it exists in very earnest.

THE remodelling of the present Teachers' Register, which gives so little satisfaction, is a task which will have to be undertaken, and the Guild can do much in the way of shaping opinion aright for this. It is deeply pledged to the work of unifying the profession and cannot, therefore, accept as final the present lines of demarcation. The Congress supported the Council in its general aim, and the problem is how to secure unification without unduly lowering the academic qualification for registration. Clearly we cannot approve the present Columns A and B, divided according to the schools in which teachers work, and not according to their general educational proficiency. On a voluntary Register no one should be put without his or her personal initiative. No satisfactory Register can exclude the kindergarten teachers or the teachers of the lower forms in preparatory schools. The solution of the difficulty seems to lie in the establishment of what we may call an ordinary Register, with a first-class or higher Register to which, by fulfilling the necessary requirements, a teacher entered on the former can at any time pass. The professional qualification should be equally high in both cases, the academic qualification should be more stringent in the latter. Such a Register would abolish the distinction between the primary- and the secondary-school teacher, as such, and at the same time would emphasize the attainments necessary to the undertaking of the higher work in schools.

The proposals of the Council (1) to revive the work of the Education Society within the Guild, as the association best qualified to promote purely pedagogic science generally, and (2) to work for the material reduction of the number of external examinations, received the unanimous approval of the Congress.

THE Congress dealt, in the afternoon, with several pressing matters connected with the internal economy of the Guild, such as Branch co-operation on the Council and locally, the financial situation, and the improvement of the *Teachers' Guild Quarterly* as the organ of the Guild—all of great importance in view of the necessary strengthening of the hands of the Council for the work before them.

WE are asked to remind members of the impending expiration of the "grace" clauses of the Regulations for Registration in Column B of the Teachers' Register. Applications under Regulation 5 (2) *b* (ten years' service clause) must be received at the Council's offices, 49 and 50 Parliament Street, S.W., on or before March 5, 1905. Applications under Regulation 4, under which clause training is not obligatory, must be received on or before March 5, 1906. Copies of the Regulations and forms to be filled in may be obtained on application to the Registrar. We believe that nearly 7,700 teachers have been registered in Column B, to date.

COLONIAL AND FOREIGN NOTES.

FRANCE.

This paragraph is not to be so revolutionary as the side-heading might suggest. We do not ourselves propose to abolish head masters, being anxious rather to assist and support them—at least, whenever Holy Orders are not their chief qualification. We merely report a movement in France, where sacrilegious hands are threatening the *proviseur*. In truth, he is not always a popular personage. He has to furnish higher officials with appreciations of his colleagues. Whence is he to get the necessary knowledge of their merits and demerits? His visits to class-

rooms are frequently unwelcome. On the other hand, if he seeks to bottom his teachers in private conversation, he finds they resolve themselves into two classes—some are shy of him lest they should be thought to be courting their superiors; others display an unnatural amiability. It is intelligible enough that social relations in the *lycée* should often be strained. Would it not do, asks M. Massé, to have simply a *doyen* of the *professeurs* appointed by the Minister from time to time upon their presentation? The answer is made that intrigues to secure the nomination would work more mischief than results from the present arrangement. We know, moreover, that a staff cannot be trusted to make the best selection. The Harrow masters, in 1885, being practically free to choose, rejected Edward Bowen in favour of another, and afterwards repented them of their doing. In all reforms it is well to consider carefully what is to be got in exchange for what goes. If this be done, the French will cling to their *professeurs*, as we to our head masters.

The principal business of a foreign note is to discourse of the things that others do better than ourselves, since it is from them that we may learn. Exceptionally, we touch here, with all modesty, on a matter in which we appear to advantage. The French hygienists complain that the French boy is overburdened—not so much by reason of the time that he spends in school as owing to the amount of preparation that is demanded from him. By way of illustration, one of them produces the time-table of a boy in the form called *Seconde* of Section C. It must be premised that the *professeurs* had put their heads together and agreed to ask for the bare necessary minimum. In spite of this self-denying ordinance, their claims worked out thus:

Subject.	Hours in Class.	Preparation (hours).
French	3	4
Latin	4	7
Modern History	2	1½
Geography	1	1½
Modern Languages	2	3
Mathematics	5	7½
Chemistry and Physics	3	3½
Practical Exercises in Science ...	2	—
Drawing	4	—
Total.....	26	28½

Thus the boy must give to his books fifty-four and a half hours a week, to say nothing of one hour devoted to gymnastics, one hour to religious instruction, and, during the first quarter of the year, one hour to geology. But it is at the proportion of preparation to class-work that our readers will marvel. Fancy seven hours spent in studying Latin for four hours in class! As nearly as we can estimate, the average preparation in the corresponding form of an English public school would be about fifteen hours a week for all subjects. Leaving the French boy to get redress as he can, we recommend him meanwhile as a weapon of defence against English parents who complain that their children are taxed unduly out of school.

UNITED STATES.

The New York City Teachers' Association has been appealing to the Board of Education for a more equitable administration of the by-laws that relate to deductions for absences. Under the rules of the Board the teacher is excused from attending school if he can get a leave of absence signed by his principal. But these rules have been nullified by the action of the superintendents; and in practice his salary goes to the pension fund whenever he does not perform his duty. The Association points out that teachers are the only city employees to whom absence with pay is not allowed. This does indeed seem a hardship; but the whole question is beset with difficulties. School authorities employing a substitute can hardly be expected to pay twice for the same thing. On the other hand, the salary of a teacher is usually so small that it is actual cruelty to diminish it. The New York superintendents urge that the deduction is necessary for the maintenance of discipline and to check absence under frivolous pretexts.

Coeducation may mean the joint rearing of boys and girls during the years before adolescence. But your true coeducator demands that they shall be brought up together through all the stages of their education. There is an argument in favour of the complete thing that has great weight in the United States, and a less great, but ever increasing, weight in England, namely, economy. We quote from a writer in the January number of the *Educational Review*: "It is clear that the college of the future will be coeducational. There are in the United States 464 colleges for men. In 1870 one-third of these colleges admitted women; in 1880, so successful had coeducation proved itself to be, one half had been opened to women, and in 1900 two-thirds of all colleges for men had become coeducational. At the present time, if we omit Catholic colleges—which in America are mainly training schools for priests—80 per cent., or four-fifths of all

colleges for men, teach women exactly the same subjects by the same professors in the same lecture-rooms, and allow them to compete for all their degrees, prizes, and fellowships. There are in the United States also 13 separate colleges for women. In the year 1902 there were nearly 22,507 women studying in colleges for men, and over 5,549 women studying in separate women's colleges, or, in all, about 28,000 women college students. Although there were in the United States 2,000,000 fewer women than men, women formed about one-third of all college students. In addition to the 28,000 women students in colleges and graduate schools of philosophy, there were in 1902 9,784 women studying engineering, mechanics, agriculture, and other technical subjects in Universities and technical schools; 1,177 studying medicine, 218 studying pharmacy, 162 studying dentistry, 165 studying law, and 106 studying theology, or a total of 12,614 women pursuing professional and technical courses. If we combine these two classes of students, we get a total of 40,676 women studying in the colleges and professional and technical schools of the United States, and the number of college and professional women students is steadily increasing. Coeducation is the only economical method of educating all those women. It is impossible, even if it were not criminally wasteful, to duplicate in every part of the world colleges and Universities for women; and not all the wealth of all the world can duplicate the few great scientific teachers that are born in any single generation. Experience proves that, unless schools—and, still more, Universities—are conveniently near, even boys go without a higher education. Unless, in the future, all existing colleges and Universities are to become coeducational, unnumbered generations of girls must go without any education beyond that of the high school."

We are aware that opinion is much divided as to the expediency of complete coeducation. What County Councils may be constrained to do in respect to it when rate-payers learn how it would save expenditure we do not stay to anticipate; but, turning from the college to its students, we ask: Suppose the young American graduated, what becomes of him? Figures are before us relating to Yale, which holds a high place among the collegiate institutions of the United States. It is surprising to find that of its 12,665 graduates 4,816, or about 38 per cent., have addressed themselves to some branch of commerce. Law has absorbed 24½ per cent. Only 9 per cent. have developed into doctors; 9, too, is the percentage of clergymen among the whole number of graduates. No one doubts that commercial men are the better for a University education. In England they often get it under a misapprehension. What they really desire are technical *Hochschulen* or *Polytechnica*.

A writer in the American *Journal of Education* deals trenchantly with the ever urgent question of the payment of teachers. It is an old story; but it is necessary to tell it over and over again. In Indiana, of which he writes, the average salary of the public-school teacher is 308 dols. a year. Now an ordinary farm hand can earn there 240 dols., with board and lodging in addition. A clerk makes from 500 to 750 dols.; a skilled workman 761 dols. We give the conclusion that is drawn and leave our readers to find a parallel to the state of affairs exhibited. "Only comparatively few persons can afford to engage in public work as a permanent profession. They cannot afford to make the necessary preparation. They cannot afford to remain in a profession where only 16 in 1,000 receive more than 1,000 dols. a year. Neither can they afford to remain in a profession where they are liable to be dismissed without cause at any time, humiliated, sometimes maligned, and then set adrift. . . . These economic facts, more than anything else, account for the large number of boys and girls who play at school teaching, who are unprepared for the work, and who cannot, as a rule, afford to prepare themselves. These facts also explain why nearly one-third of the teachers of the State leave the profession annually, and why so few persons become and remain truly professional teachers."

INDIA.

We cannot remember that we have given any account of Sir Andrew Fraser's scheme for a model college and school at Ranchi. He does not believe in exclusive institutions for particular classes. "In England the sons of the peer and the merchant, the doctor and the soldier, the barrister and the squire, are educated together. What a *zemindar's* son requires is to be so educated as a gentleman as to develop his mind and broaden his sympathies. To be educated at a purely class institution will have the contrary effect." Sir Andrew designs not merely an Indian Eton, but an institution (like that conceived by Milton) which shall be school and college in one. In it the sons of professional men of all kinds, communities, and religions are to mingle together. We foresee difficulties, but we wish Ranchi success. An obvious difficulty is the religious one—more real in India than in England. If it be desired by the parents, the boys will receive religious instruction every day for half an hour or less, and every day there will be given in the hostels an exposition of the principles of religion by a suitable person. Funds

are to be raised by subscription. Benefactors may give money to provide hostels for Hindus, Mahomedans, and Brahmos without distinction; but, if any one wishes to make a special gift in favour of a building for some particular community, he is free to earmark his donation. At the outset there will be three houses for Hindus, two for Mahomedans, and one for Brahmos—each to hold forty students. The education given will be generally the same as in the Presidency College, an option being allowed between the Arts and Science Courses. The training is to be up to B.A. and B.Sc. standards. Some instruction in agriculture being necessary for the sons of *zemindars*, an experimental farm will be attached to the college. Three rates of fees are to be charged—viz., 15, 30, and 45 rupees a month; but a hope is expressed that scholarships will enable a leaven of poverty to be introduced into a society consisting mainly of the rich.

CANADA.

Canada is suffering from a scarcity of qualified teachers, and is put to shifts to make good the lack of them. Of those employed 50 per cent. are trained and 50 per cent. untrained. The quality of the latter may be guessed without our assistance. But, if they have no training, they are, nevertheless, "authorized," short time permits, or licences for a limited period, being issued to them. Only 2 or 3 per cent. of the holders of temporary licences qualify at a later date for life certificates. The holders serve, on an average, not more than two years. There are, of course, local difficulties to be overcome, but the Canadians must know as well as we do that the best way to improve the supply is to augment the wage. Even your schoolmaster will be fed.

VICTORIA.

The revival of interest in the fortunes of Melbourne University, and its rescue from financial embarrassment, have been greatly aided by several notable benefactions in November last. The gift by Mr. Higgins, K.C., M.P., of £1,000 to found a £30 a year scholarship for the study of poetry has been followed by a donation of £3,000 by Mr. David Syme, the proprietor of the *Age* and a distinguished man of science, to found an annual prize for original scientific research by Australians. The fund started by Janet, Lady Clarke, and a committee of graduates and public men to meet the State Government's offer of £1 for every £1 raised by voluntary effort already totals over £10,000. The appointment of Dr. Skeats to the vacant Chair of Geology has been very favourably received.

The determination of the Victorian Education Minister (Mr. Sachse, M.L.C.) to follow the advice of his Director (Mr. Tate), and inaugurate in 1905 public continuation schools for candidates for the teaching service, has been received with strong opposition by the heads of private colleges. The schools are to be open to holders of State school scholarships, as well as to budding teachers; so the scheme hits the private establishments who have benefited by these scholarships pretty hard. The representatives of the secondary schools, headed by—of all men in the world!—the Rev. Dr. Fitchett, of the Methodist Ladies' College, accordingly denounced the scheme by deputation, and through the columns of the Conservative daily, the *Argus*. In the course of his speech, Dr. Fitchett said that vested interests to the extent of three-quarters of a million sterling were affected by the proposal. Notwithstanding this assault, the Minister declared his intention of adhering to his determination.

CORRESPONDENCE.

MUNRO'S "SOURCE-BOOK OF ROMAN HISTORY."

To the Editor of The Journal of Education.

SIR,—My attention has been called to the notice of Mr. D. C. Munro's "A Source-Book of Roman History," which appears in your December issue, and, as your reviewer apparently fixes upon this book to justify previous unfavourable judgments of certain American books which may or may not have been wrong, perhaps you will allow me to show how some of the "criticisms" in this particular case strike a reader.

1. The word "authority" has been quoted as though it had been used in the text-book, whereas reference to the preface will show why these lists of books were put in.
2. It is not surprising that Mr. Munro did not make any use or mention of Mr. R. Ellis's new text, as this was not published until a later date.
3. The treatise "De Mortibus Persecutorum" is accepted as the work of Lactantius by Teuffel, Ebert, Schiller, Burckhardt, Bray, and other competent scholars. The weight of authority is conclusively against Brandt.

4. In the question of "Caius," "Gaius," "Cneius," &c., the author from whom the translation has been taken has been followed in each instance—probably the only satisfactory rule in such a case. In the bibliographical notice the author followed general usage.

5. The concluding sentence of the notice seems to be particularly unfair to Mr. Munro. The only reference to Seeley's "Livy" appears to be that on p. 2, which reads: "Seeley: Livy, Book XIII., Introduction." It is clear that "Book XIII." is a printer's addition, which failed to meet the author's eye in the proof.—Yours faithfully,
GEORGE G. HARRAP.

[For a reader who believes that printers make such additions as "Book XIII." I can do nothing—except advise him to read more. Others may be glad to know that everything that I stated is just as I stated it and not otherwise. The objections raised have no weight.—YOUR REVIEWER.]

REGISTRATION OF TEACHERS, COLUMN B.

To the Editor of The Journal of Education.

SIR,—You are no doubt acquainted with the fact (sufficiently notorious) that assistant masters in the public schools and the larger grammar schools have shown no great anxiety to get their names entered on the Register of Teachers. In view of the early expiration of the "days of grace," may I call your readers' attention to the following facts?

In consequence of the passing of the Education Act, some modification has become necessary in almost every scheme governing any endowed school in England. However trivial the modification may be, if it only adds, say, a single representative governor, it gives the Board of Education the opportunity of adding whatever "Clauses of common form" are fashionable at the moment. Now, among the clauses in favour just now is one that runs: "The head master (to be appointed) shall be a graduate, . . . &c., and shall be a registered teacher."

Thus it comes about that for the future practically no head masters will be appointed to endowed or municipal schools who are not registered teachers, and so all secondary teachers of standing ought to see that their names get on the Register in the course of the next few months.—I am, Sir, your obedient servant,
G. C. CHAMBRES.

LADYBARN HOUSE SCHOOL, MANCHESTER.

To the Editor of The Journal of Education.

DEAR SIR,—The *Journal* for December contains as its first "jotting" the statement that this school has been placed under the Manchester Education Committee. As this is not the case, will you kindly have the statement corrected in your next issue?

I think the mistake has arisen from the confusion of two local events occurring about the same time—

1. The opening of a new provided school in the parish of Ladybarn by the Withington Education Committee, which since November 1 has been absorbed into the City Education Committee.

2. On May 1 this year Ladybarn House School (of which I enclose a prospectus) ceased to be a private school.

I am sorry to trouble you with this little matter, but a few authoritative words from you will stop the confusion spreading further.—I am, yours faithfully,
CAROLINE HERFORD, Head Mistress.

POSTCARDS AS FACTORS IN EDUCATION.

To the Editor of The Journal of Education.

SIR,—As you inserted my letter some months ago on "Postcard Albums as Note-books," you may like to set before your readers a further use for postcards.

On the lines of "pit" excellent and exciting games can be provided. At the present moment I am arranging one on English Architecture—Norman, Early English, Decorated, Perpendicular, Late Tudor, Renaissance, Mixed. To these could, of course, be added the Classic styles. Each card must be carefully chosen, as illustrative of some particular feature, structure, ornament, metal work, statuary, wood, work, &c. I subsequently hope to arrange one on English history Saxon, Norman, Plantagenet, &c., and one on Geography, taking the trading routes of the world. In this case the products would be written on blank cards to match the postcards of the cities.

The cards must be backed up with stout cardboard, or their life will be short indeed.—Faithfully yours,
E. BOYER BROWN.

A CORRECTION.

To the Editor of The Journal of Education.

SIR,—May I point out to your reviewer of Mr. How's "Six Great Schoolmasters" that it was Kennedy, and not Moberly, who achieved the remarkable feat of making boys "love the Thirty-Nine Articles"? Your reviewer has given other and sufficient reasons why Moberly is not to be classed as a "great schoolmaster." This particular charge was unnecessary and not justified by the facts (see page 109).—Yours,
FRANK RITCHIE.

UNIVERSITIES AND SCHOOLS.

LONDON.

The rules for the Library, as revised and recommended by Convocation, have now been approved by the Senate. The additional hour from 4 o'clock to 5 could not be granted, as meetings of the Senate and other bodies rarely begin till 4.30, and the Reading Room will be required for this purpose until the Government grant the University more commodious premises. However, as a set-off, the Senate makes two alterations in the direction of liberality. A second period of three months is to be allowed for study of books taken out of the library, if the books are not wanted by another reader; and readers are now to be allowed to borrow and return books by registered post—all fees being paid by the borrower.

The work of arranging and cataloguing the Library is progressing steadily; but it must be some time before the Library and Reading Room will be ready for use.

On January 13 about forty members of Convocation were, at the request of their Vice-Chairman, Dr. Mears, received by Dr. Waller and shown over the Physiological Laboratory.

The minutes of meetings of the Senate are now presented to Convocation. This concession also is owing to the Vice-Chairman.

University Extension is flourishing vigorously in the London area under the auspices of the University. 179 courses of lectures (and classes) were delivered during the session 1903-4, an increase of 12 over the previous session, and it is to be noted that 43 of these were sessional courses, each of which includes 3 terminal courses—viz., a Michaelmas, a Lent, and a summer course. This represents a significant advance in thoroughness of work.

Twenty-two students were awarded the Sessional Certificate in Honours, of whom the great majority were in scientific subjects, Economics being a favourite. Two students only were successful in Literature and three in History. The final requirement for this certificate is the writing an original essay on advanced work, and it would be far more interesting if the Extension Board could deal with these papers more promptly, and issue a report upon them, and include these results (the most advanced part of the year's work) in the year's report. As the essays are sent in by September 1, it should be possible to decide the result before (as last session) the end of November. The constitution of the Board would seem to require strengthening on the literary side by one or two members. Prof. Ker, for example, would be an admirable addition.

The journal (now called *University Extension*) is issued only three times a year, instead of about nine times as before.

Five interesting courses of lectures on military subjects are now being delivered at the University: they can be attended by any British subject for £2. 2s. a course, or the modest sum of £10 for the whole. The Secretary for War made an interesting speech at the opening lecture.

It is stated that Sir Philip Magnus intends to come forward at the next Parliamentary election as a candidate for the membership for the University.

At the examination in Pedagogy, 1904, it is noteworthy that all the candidates (twenty in number) seem to have passed, three only in Division I (two women and one man).

All London graduates who wish to place their names on the Register of Teachers in Column B under the "grace" clauses should note that March 5 is the latest date.

OXFORD.

Though two months have passed since my last letter, not more than ten days of that time, if so much, belong to the normal working days of the University. There is, therefore, not much as yet to chronicle in the way of academic activity.

The loss by death has been, unfortunately, rather heavy, containing, as it does, the following names:—The Rev. H. L. Thompson (Christ Church), Vicar of St. Mary's, formerly Head Master of Radley, who has done valuable work in Oxford on the old School Board and on the new Educational Authority; Rev. R. E. Bartlett (Trinity College), formerly Bampton Lecturer (1888); Rev. E. J. Payne, Fellow of University College; Rev. S. N. Tabbs, Fellow of St. John's, killed in a railway accident on December 19; and Mr. T. W. Caphouse, Mayor of Oxford, a man widely known and respected in the City and University, who received the honorary degree of M.A. some years ago in recognition of his knowledge and research in the history of music and musical instruments.

The movement for offering increased opportunities to students of other Universities to work at Oxford—a movement so largely stimulated by the Rhodes Trust—still continues active; and among the decrees passed in December was a provision whereby any candidate from the four Scotch Universities, under certain conditions of residence and study at his own University, is to be admitted to the privileges of a "Junior Affiliated Student" at Oxford. This is only the last

of many steps taken during the past two or three years to adopt at Oxford something like the system, found so useful in Germany, whereby residence and work at any one University can be counted for standing and degree at any other. This power of free interchange is obviously an advantage to all parties. The more a student can avail himself of the special advantages (of system or teachers) at all Universities without interfering with the continuity of his study, the better for the interests of learning.

There has been no time since I last wrote for new projects of legislation, but two decrees passed in December have an interest as small indications of the steady tendency to adapt the curriculum to new needs. One concerns the new Diploma in Scientific Engineering and Mining Subjects, a recent addition to the growing list of these Diplomas, which already embrace Health; Geography; Economics; and Theory, History, and Practice of Education. The other establishes "Military Law" as a new option in the Pass Schools of the University—a reminder of the recent laudable efforts of the War Office to get aid from the Universities in improving the education of the Army.

Another decree, also trifling in itself, has also an interest as a star marking new currents. The Council have appointed a small committee of three (the Vice-Chancellor, Mr. Gerrans, and Mr. Matheson) to deal with all applications from Local Educational Authorities for inspection or examination of schools. The two Delegacies (Joint Board and Local Examinations) whose very competent secretaries are members of the committee, have for some years past been from time to time inspecting schools; so that, in addition to their large staffs of experienced examiners, they are now able to supply a certain number of men expert in the quite different work of inspection. It is entirely desirable that the new Local Authorities should not confine themselves to inspection by their own officers, or by the Board of Education; but should be able to keep up a connexion with the Universities by employing their inspectors, as they already so extensively employ their examiners. It is also good for the Universities, whose real knowledge of the secondary schools has perhaps been less than their inevitable influence upon them, that the contact should be drawn closer: and this result is better attained by inspection, involving personal visits to the school, than by examination, where the main work is reading and marking papers, and the personal knowledge of the place, the men, the boys, and the system, is far less.

The chief incident of the vacation of local interest to the residents has been the election of Prof. Case to the Headship of Corpus Christi College. The new President was educated at Rugby under Dr. Temple, entered at Balliol in 1864, obtained a First Class in Moderations and *Literæ Humaniores*, was successively Fellow of Brasenose and Tutor at Balliol, Fellow and Tutor of Corpus from 1871 to 1889, and in the latter year was elected Waynflete Professor of Moral and Metaphysical Philosophy, and Fellow of Magdalen College. He now returns appropriately to the college with which he was for the longest time connected. He has never served on any of the numerous Administrative Boards of the University, except the Helderomadal Council, of which he was for a time a member. But for many years he took an active and influential part, on the "Conservative" side, in the debates of Congregation. At school he was a distinguished cricketer; and it is safe to say that he is the only Head of a college who was for four years (1864-7) a member of the Oxford Eleven.

The following announcements have been made:—

Gifts to the University: A subsidy from the Rhodes Trust to the Readership of Pathology. A gift of £1,000 from E. Whitley (Trinity) to the Chair of Pathology. Two new prizes (anonymous)—(1) of £70 for a monograph or work on "German History from 1250-1870"; (2) £40 for a treatise (or other work) on "Continental Thought in the Fourteenth and Fifteenth Centuries."

Appointments: Representative Governors: University College, Nottingham—Right Hon. A. H. D. Acland (Hon. Fellow Balliol), S. Ball (Fellow St. John's); University College, Bangor—Sir T. Raleigh (All Souls); St. David's Lampeter—Warden of Keble, Principal of Jesus; Derby School—Prof. Cook Wilson (New College); Ewelme Exhibition Endowment—H. E. Salter (New College). Delegacies—Lodging Houses, J. Tracey (Keble); Instruction of I.C.S. Students, J. L. Strachan Davidson (Balliol), H. W. Blunt (Christ Church); Common University Fund, D. B. Monro (Provost of Oriel); Visitor (Ashmolean), Dr. Farnell (Exeter), re-elected. Select Preachers—Dr. Chase (Queens', Cambridge), Warden of Wadham, Rev. J. H. Ellison (Merton), Rev. W. H. Carnegie (Magdalen), Rev. C. M. Blagden (Christ Church). Living—Kirkdale (Yorks), Rev. F. W. Powell (Lincoln).

Degrees: Honorary—Mus.Doc., Sir E. Elgar; Research—D.Sci., H. B. Baker (Christ Church), T. C. Porter (Exeter).

CAMBRIDGE.

Term has so recently begun that nothing of very much consequence has had time to happen. We have just come up, arranged lectures and coaching hours, and barely had time to glance at one another's letters on the Greek question in the *Times* and the *Guardian* and elsewhere, and to wonder what is going to happen at Herculaneum. The

last event of any importance that occurred there was unpredicted, and the next is similarly unforetold. Meantime we wish the cause of excavation well.

We have not as yet any definite statement as to the number of freshmen this term; but at the Congregation on January 19 the year opened well for the University, something like a hundred and fifty men taking degrees of various kinds. The total numbers for last year were a little lower than normal.

We are promised some interesting public lectures this term. The Birkbeck Lecturer at Trinity (Mr. W. H. Frere) is to lecture on "The History of Religious Orders in Mediæval England." Mr. Arthur Sidgwick is coming to Newnham in February to give one of the occasional lectures which are a feature of the college life—this time it is to be on Pope. Mr. A. C. Benson gives a course in the hall of Magdalene College on "The Course and Development of English Poetry in the Nineteenth Century." And, lastly, the Dean of Ely is concluding his Hulsean Lectures, which are not on the usual theological theme affected by Hulsean Lecturers, but on "The Witness of English Poets to Christ and Christianity."

The University Association has issued an appeal on behalf of the University Library, and will be glad to receive promises of contributions, endowments, and books.

Politics, too, are beginning to be interesting, and the long looked for third candidate for the two University seats is not apparently to be a member of the Cabinet, neither the Prime Minister nor any of Mr. Chamberlain's representatives, but the Commissary of the University—the duties attaching to his post, it seems, do not absorb his whole time.

Mr. R. H. Lock, B.A. of Gonville and Caius College, has been appointed Assistant-Curator of the Herbarium; and Mr. W. K. L. Clarke (a son of the Bishop of Melbourne) elected to a Theological Fellowship at Jesus.

MANCHESTER.

The death of Mr. Henry Lee has removed one who was a staunch friend of educational progress. Of his work as an employer of labour, as a Liberal, and as a Free Churchman, this is not the place to speak; but as a great millowner he was as much the friend as the employer of his people. The day schools established by him for the benefit of the children of his employees were long considered models of their kind, and were kept up at considerable cost to the firm for more than twenty years after the passing of the Act of 1870. Of late years he had devoted himself to the welfare of the Grammar School, and he attended a meeting there as deputy-chairman of the governors within a few days of his death. He was the only surviving member of the governing body under the old scheme, and was largely influential in raising the new buildings. For the last few years of his life he held the office of treasurer.

In addition to the scholarships reported last month, Grammar School boys have won open classical scholarships at Oriel and at Corpus Christi Colleges respectively. At the same University, not only has the Junior Mathematical Scholarship fallen to a Mancunian, as foreshadowed, but the exhibition and *proxime accessit* in the competition were both awarded to old Manchester boys. The three who thus head the list were all pupils of Mr. H. G. Willis, M.A., chief mathematical master.

During the past year the numbers at the Grammar School have risen by about a hundred, and the present term opens with eight hundred and fifty boys in attendance. Mr. William King, M.A., formerly a pupil of the school, has been appointed to a mastership on the modern side. The boarding house sanctioned by the Governors is about to change hands. It is probable that a boarding house near the new playing fields will shortly be opened by Mr. E. A. Varnish, M.A., master of the preparatory form.

Festivities in connexion with the annual Founders' Day commemoration began at the Girls' High School on January 19, this being the thirty-first anniversary of the foundation of the school. Prof. Conway, of the Manchester University, delivered an address upon "The Purpose of Education." Miss Burstall addressed the Old Girls' Association on the 24th. Miss Bush, formerly of the Macclesfield Grammar School, has joined the staff. A number of pupil-teachers from the Withington district are now attending the High School.

The Broughton and Crumpsall High School for Girls has been fully inspected by the Board of Education. An interesting alteration in the time-table has been made at the suggestion of the Inspectors of the Board. The school hours in future will be: morning, 9 to 12; afternoon, 2.30 to 4.30, with half an hour less in winter. The numbers are at present 170, and the staff has been strengthened by the appointment of Miss M. Bellman (Oxford Honours School of Modern History) and Miss B. Fullford (B.Sc. Lond., a student of the Owens College).

Perhaps the most important event at the University has been the announcement that in future degrees will be granted in Dentistry. In moving the adoption of the new ordinances, Prof. Stirling explained that a diploma and a degree would be granted in Dentistry, the

holders of which would have passed the usual Matriculation, completed a four years' course of study, and qualified by practical work in a dental hospital. Diplomas are also to be granted in Public Health and Veterinary Medicine. The new degrees will be entitled Bachelor and Master of Dental Surgery respectively. It is intimated that the University of Liverpool will follow suit.

At the meeting of the Court it was stated by the Vice-Chancellor that the total number of students was 1,130, and that the number preparing for Matriculation had decreased by about 30 per cent. Principal Hopkinson also announced the arrangements for the Degree Ceremony on the 27th, when he hoped Earl Spencer would be present to welcome the representatives of foreign Universities, on the occasion of the opening of the new laboratories by Mr. W. J. Crossley.

An important meeting was held in the Lord Mayor's Parlour on January 11, when, in the absence of the Lord Mayor, Sir F. Forbes Adam, President of the Chamber of Commerce, moved that it was highly desirable that more University men should be drawn into business, and that there was need of a city organization for this purpose. It was afterwards resolved that the best means for attaining the end in view would be a Graduates' Employment Bureau in connexion with the Chamber of Commerce. The Dean of the Faculty of Commerce reports that sixteen students have entered for the degree, but more than half of these are evening students. It is hoped that the teaching will be extended to the subject of public administration, so that men may qualify for employment in Government offices.

Prof. Lamb has presented to the University an interesting collection of portraits of mathematicians and natural philosophers. The local Branch of the Teachers' Guild have presented their library to the University. The Fielden Demonstration School was opened on January 16, with twenty-eight boys. The curriculum has been arranged mainly on the lines of a higher-grade school, as recommended by Prof. Sailer in his Birkenhead report. The Hall of Residence for women students, accommodating thirty, has been recognized by the Board of Education as a hostel at which students of the University Training College may reside. The Hall is full at present.

The first item of business that awaited the Manchester Education Committee in 1905 was not a pleasant one. It was the consideration of the award in the arbitration with respect to an extra claim for £38,000 made by the builders of the School of Technology. The result of the arbitration is that the Corporation are to pay about £20,000 and £1,000 costs, and application has been made to the Local Government Board to borrow a further sum of £20,000 in connexion with the cost of the erection of the school. The amended scholarship scheme was laid before the Committee on January 16. It is described as providing "a means whereby boys and girls may pass from the lowest to the highest educational institution in the city at a minimum of expense to their friends." An attempt to secure that some of the scholarships should be tenable at the older Universities was not successful. Perhaps the most interesting feature of the scheme is the provision for the teaching profession. There are 30 training college exhibitions of £20 a year for two years, and each year 300 bursaries (220 for girls and 80 for boys) are offered for pupil-teachers. These bursaries are tenable for two years in "any approved secondary school."

As the year that has just closed is the first complete year in which the Act of 1902 has been administered, it is interesting to note that with an estimated population of about 630,000 the city has 111,000 children on the books of the elementary schools, and the average attendance in November was 97,361. There is accommodation for over 125,500. The numbers are fairly equally divided between provided and non-provided schools. In Salford, on the contrary, the non-provided schools outnumber the others in the proportion of nearly two to one, and the average attendance is about 37,000.

BIRMINGHAM.

Since my last communication the University has made a number of important appointments, and has received one munificent new endowment. The Chair of Anatomy has been filled by the election of Dr. Arthur Robinson, the Professor of Anatomy at King's College, London; the new Chair of Electrical Engineering has been given to Mr. Gisbert Kapp, Lecturer on Dynamo Construction in the Technical Institute of Charlottenburg, Berlin, who will come into residence in September next; and the Chair of English Literature, vacant by Prof. Macneile Dixon's transference to Glasgow, has been filled by the appointment of Mr. J. Churton Collins, the eminent writer and lecturer in various departments of English literature. Amongst minor appointments may be mentioned that of Mr. J. F. Gill, M.Sc. (Vict.), as Demonstrator of Mechanical Engineering, and the temporary engagement of Mr. J. F. Dobson, M.A. (late Scholar of Caius College, Cambridge), as Lecturer in Greek, in succession to Mr. J. H. Hopkinson, M.A., who has been appointed Warden of the Hulme Hall in Manchester.

The new endowment is that of a Chair of Music. The giver is Mr. Richard Peyton, a well known and public spirited citizen of Birmingham, who has taken an active part in the promotion of things musical in this city, and in particular has been one of the chief supporters of our

famous triennial Musical Festival. He gives £10,000 to the University in order to found a Professorship of Music, the only condition attached being that the Council should, in the first instance, ask Sir Edward Elgar to be the first Professor. The condition was gladly accepted, and Sir Edward Elgar is already appointed as the first Professor of Music. It may be mentioned that an additional £1,000 has been given by Sir John Holder towards the incidental expenses of a Faculty of Music.

During the month of January a considerable step forward has been made with the scheme for establishing a college for higher education in the North of Staffordshire. This district is situated at an inconvenient distance from Birmingham, and it has been difficult, if not impossible, for its students to attend the University here. An influential deputation appeared before the Staffordshire Education Committee on January 14 to suggest that the time has arrived for the County Council to take over the primary responsibility in the matter. The land for the college near the railway station at Stoke has been generously offered by the sons of the late Mr. A. S. Bolton, of Oakamoor, in accordance with their father's wishes, and already a very considerable sum has been promised towards the erection and maintenance of the proposed college. It is believed that there is special need in the district for organized scientific instruction in pottery and the kindred arts, and that such an organization would greatly benefit the whole industry of the district; the subject of mining would also be an important feature of the college. In addition to these technical sides of the scheme, it is expected that the college will provide a very suitable centre for the training of elementary teachers, both in the pupil-teacher stage and the training college stage. The general idea of the scheme, which was ably explained by its chief organizer, Mr. Albert W. Brown, M.A., was received with much sympathy by the members of the Education Committee, and it was generally felt that the establishment of the College had now been definitely brought within the pale of practical politics.

WALES.

Most of the County schools seem to have held their speech- or prize-days—for the latter seems to be the favourite term—towards the end of the year and the beginning of the present term; and innumerable speeches—good, bad, and indifferent—were delivered at these functions. The most curious of all these orations were spoken at the Aberystwyth County School. Sir Marchant Williams, the Warden of the Guild of Graduates, after repeating his usual complaint about the form and style of the Central Welsh Board report, criticized that institution on the ground that it was a mere “examining and inspecting syndicate.” It would be quite as reasonable to criticize a stipendiary magistrate because he imposed fines and sent offenders to prison. Mr. Austin Jenkins, Registrar of the Cardiff University College, said that the Central Welsh Board was an “extremely costly piece of machinery, and it was extremely doubtful whether it was quite as efficient as it might be.” It is evident that Mr. Jenkins's educational studies have not extended as far as investigation of the comparative cost and efficiency of inspecting and examining authorities. Mr. Vaughan Davies, M.P., announced that “as an educationist of many years' standing” (what is the qualification for being an “educationist” in these days?) “he could not for the life of him see what the Central Welsh Board had done to promote higher education in Wales.” Mr. Davies's educational eye must be suffering from cataract. It is only fair to the orators at other school speech days to say that their addresses were at least different from those given at Aberystwyth.

At the Annual Collegiate Meeting of the Court of the University of Wales, held at Aberystwyth, it was reported that 492 students had entered for the last Matriculation Examination, of whom 249 had passed, that the number of candidates who had entered for the initial degree examinations in the Faculties of Arts, Science, Music, and Law in 1904 was 867, being 92 above the number in the previous year, and that the total number of degrees awarded was 180, a figure far in excess of any previous year. It was resolved that after 1907, except in certain cases provided for, no courses be counted in a candidate's scheme of study unless he has completed matriculation—a matter of some importance to Welsh secondary schools. The chief subject debated was the draft for a supplemental charter and statute of affiliated colleges to provide for the requirements of higher technical education in Wales. It was resolved: “that, subject to such terms and conditions as may from time to time be prescribed by statute, the Court may by statute declare to be a college affiliated to the University in respect of any faculty or faculties in which the Court is empowered to admit to degrees any public educational institution which gives adequate instruction of a University character in such faculty or faculties, including, at least, one branch of technical or applied science and the subjects cognate thereto,” with the rider: “that the Court does not consider it desirable at present to take powers by the charter which extend beyond the requirements which are connected with the promotion of applied science.” The plain English of all this is that the Court is prepared to accept the Swansea

Technical College as an affiliated college, if its students confine themselves to higher scientific and technical studies, but will not encourage it to develop an Arts side, which seems an eminently sensible decision. After the meeting of the Court, a Congregation of the University was held for the purpose of admission to degrees, at which there was the usual boisterous clowning.

The Annual General Report of the Central Welsh Board for 1903-4 contains, as usual, very interesting statistics and pronouncements. A new system of inspection has been adopted whereby schools undergo a complete administrative and educational inspection once in three years, subsidiary inspections only being held in the interval. Last year 32 schools were visited for the purposes of the complete inspection by the Chief Inspector, the Assistant Inspector, Miss C. L. Thomson, Miss I. C. W. Thomas, and Mr. A. S. Way. On the school rolls there were 9,284 pupils (4,690 boys, 4,594 girls), an increase of 495 on the previous year. The assistant staffs of the schools were augmented by 20 assistant masters and 7 assistant mistresses. Of those who hold degrees it is interesting to note that 92 have obtained them at the University of Wales. The average salaries paid to assistant masters and mistresses were £130. 17s. 2d. and £109. 1s. 6d. respectively. The sum of £19,050. 17s. was expended on scholarships and bursaries; 2,638 pupils were presented for the written examination. Of these 1,443 entered for the Junior Certificate, 845 being successful, 781 for the Senior, 513 passing, and 181 for the Honours Certificate, 145 satisfying the examiners. About 30,000 scripts were sent in by these candidates.

The Chief Inspector in his report again emphasizes the urgent need of subsidizing the maintenance funds of the schools, an additional annual sum of not less than £40,000 being, in his opinion, required. He makes the suggestion that it would be well to make some deviation in the upper standards of elementary schools in the case of pupils intended to proceed to secondary schools—a suggestion which is not likely to meet with acceptance—and touches on the question of the differentiation of schools and the necessity of making greater use of the Welsh language. There are still, it appears, in the bilingual parts of Wales at least fifteen schools in which the Welsh language finds no place in the curriculum. The examiners, on the whole, are well satisfied. “The work in Scripture was satisfactory and full of promise.” In English Composition “the work was on the whole very satisfactory,” and in English Language “the teachers are thoroughly competent for their work, and the teaching is careful and conscientious.” The character of the work in English Literature varies: “the standard attained in the Honours stage was very satisfactory, that in the Junior stage often excellent, but a large amount of poor or mediocre work was sent in by the Senior pupils.” In History “the schools are making steady progress both in their methods of teaching and in the acquisition of historical knowledge.” In Mathematics the teaching is becoming more practical, the general standard of the work in Arithmetic being “satisfactory,” in Algebra “very good,” and a “very noticeable improvement” being seen in Geometry. “There was ample ground for satisfaction with the study of Latin”; and “the interest shown by the pupils in Greek was remarkably keen, the result of devoted and scholarly teaching.” The Welsh examiner is not altogether pleased with the position of his subject, but recognizes that “this is not the fault of the secondary schools, but is to be attributed largely to the neglect of the language in the primary schools.” The French examiner expresses his “admiration for the sum of good practical results obtained in the Principality”; and the German examiner reports that the work was “of better quality than formerly,” and that the number of pupils entered for the language was increasing. The work in Science was uneven; some schools doing well, others indifferently. The Chemistry examiner, however, is not so sparing of his praise as he was of his marks. In Geography the work, “while better than last year, still left much to be desired.” In Book-keeping “the results were distinctly good”; and “the quality of work in Shorthand showed considerable improvement.” Drawing was “very satisfactorily taught in several, and fairly well in nearly all, of the schools.” The standard attained in Domestic Subjects was “extremely encouraging”; and the examiner in Manual Instruction “was deeply impressed by the enthusiasm and intelligence displayed by teachers and pupils.” The record of the schools, it will be seen, is, on the whole, very satisfactory.

SCOTLAND.

The statistical reports of Glasgow and Edinburgh Universities for the year 1903-4 have been issued. The total number of matriculated students at Glasgow was 2,226 (of whom 413 were women), being an increase of 76 over the figures of the previous year. The total number at Edinburgh was 3,000 (of whom 312 were women), an increase of 10. In Glasgow there has been an increase of numbers in all the Faculties except Law, the greatest advance being made in Medicine; and in Edinburgh there has been a decrease in all the Faculties except Medicine. The number of men students in Glasgow

is still nearly 300 less than it was in 1889, when the Universities Act was passed, and Edinburgh is still more than 900 behind the figures of that year. But at Glasgow the number of women students has more than redressed the balance, and, apart from this, if the abolition of junior classes is taken into account, it may be said that Glasgow has practically recovered the loss of men students that inevitably resulted from the institution of the Preliminary Examination. Edinburgh, however, has still a considerable leeway to make up. The reports also contain a record of the additions to the endowments of the Universities in course of the year, most of which have been already mentioned in this column. Among the benefactions which have been received the Edinburgh report specially mentions a bequest by the late Misses Aytoun of a sum of £2,500 for the purpose of endowing, in memory of their brother, the late Prof. Aytoun, a Fellowship in English in the University. It is also mentioned that the recataloguing of the Edinburgh University Library is now practically complete and that nearly 210,000 volumes in the general library have been dealt with, in addition to the books contained in various departmental libraries.

A legacy of £5,000 has been left to Aberdeen University by the late Mr. William Knox, for the founding of bursaries and scholarships. The memorial of the late Prof. Fyfe is to take the form of a stained-glass window in the Library of King's College, Aberdeen. Mr. George Hope Stevenson, of Balliol College, Oxford, has been appointed Lecturer in Ancient History at the University of Edinburgh. Mr. Stevenson is a graduate of Glasgow.

Considerable interest is being taken in the Education Bill, which is to be reintroduced, probably with some modifications, in the next Session of Parliament. The Educational Institute discussed the matter at its annual congress at Ayr, and the Secretary for Scotland, Mr. Graham Murray, made it the main subject of his speech at the opening of a new school at Partick. Mr. Murray did not, of course, give any very definite anticipations of the proposals to be put before Parliament; but he laid significant stress on the necessity of paying well for a good system of education, and the duty of considering the country as a whole rather than concentrating attention on the peculiar conditions of particular localities. He insisted on the necessity of improving the educational ladder; but he decidedly opposed the freeing of secondary education, preferring the system of bursaries or allowances to enable pupils to attend secondary schools. And in this connexion he indicated his preference for the system of sending children to central secondary schools over the old system of endeavouring to combine secondary with primary instruction in the small schools of the country. He was quite decided in maintaining the principle of larger School Board areas, and he insisted on the need of improvement and reorganization in the matter of the training of teachers, holding that we should work towards the ideal (whether we could realize it or not) of having every teacher a University graduate. He also dwelt upon the importance of general culture as a preliminary to any sort of technical or specialized instruction. From all this one is led to hope that the changes in the new Bill will be sound and progressive.

An important Conference has been held in Edinburgh of representatives of the governing bodies of endowed schools. Several general resolutions were passed, although some of those present, having difficulties about special points as affecting local problems, declared that they had no authority from their trusts to vote. One resolution was in favour of (1) "correlation among bodies charged with the conduct of education in towns and districts; (2) a representative authority duly empowered to settle questions in dispute between such bodies; and (3) a national system of bursaries whereby children of promise may pass from the elementary to the secondary schools, and from the latter to the Universities and technical colleges. Further, that higher grants in aid are required to meet the increased cost of secondary education." Another resolution was "that in remodelling the national system for the training of teachers the needs which secondary schools have for more highly trained teachers should be kept in view. Further that, as far as possible, teachers, both elementary and secondary, should be drawn from those who have had a thorough secondary education." The resolutions are to be sent to the various boards of governors of endowed schools, and a representative committee is to be formed to receive reports from these boards, and to formulate a policy to be laid before the Secretary for Scotland. It is most desirable that the endowed schools should be, as far as possible, fitted into the general system of secondary education which may be developed under the new Bill, and it is to be hoped that local and personal prejudices against such a correlation will be overcome.

NORTHAMPTON INSTITUTE, LONDON.

Mr. H. M. Hobart has been appointed Lecturer in Electrical Engineering Design in succession to Mr. E. Kilburn Scott, who has been appointed Lecturer in Electrical Engineering in the University of Sydney. Mr. M. Holroyd Smith has been appointed Chief Assistant in the Mechanical Engineering Department in succession to

(Continued on page 120.)

TEXT-BOOKS FOR STUDENT TEACHERS,

By J. H. COWHAM, Lecturer on Education,
Westminster Training College, S.W.

The following works on the Theory and Practice of Education have been revised and are brought up to the most modern requirement. Chapters on Nature Study, Physical Training, and Student Teacher Preparation have been added.

1. COWHAM'S PRINCIPLES OF ORAL TEACHING AND MENTAL TRAINING. New Edition, with added Chapter on "Nature Study." Price 3s. 6d.

"With admirable skill, Mr. Cowham has epitomized the results of his long experience. The method is based on the scientific principles of psychology and ethics, with which the author shows himself thoroughly acquainted; and the ability with which these principles are applied to practical class teaching is perhaps the most striking feature of the book. . . . The hand of the skilled teacher is visible on almost every page. . . . The best book of its kind for students in training."—*The Journal of Education*.

2. COWHAM'S NEW SCHOOL METHOD. Price 4s. 6d. In this work the most approved method of teaching the ordinary subjects of instruction are fully expounded, especial care being taken to make clear the reasons for each method.

The Educational Times writes:—"Mr. Cowham's excellent 'School Method.' The use of his book by those who are beginning educational work in secondary schools will save an infinite amount of time, energy, and temper."

3. SCHOOL ORGANIZATION, HYGIENE, AND DISCIPLINE (Elements of Ethics). New Edition. Price 3s. 6d. A complete and fully illustrated guide to the practical Equipment and Management of a thoroughly well-disciplined and healthy school.

4. GRAPHIC LESSONS IN PHYSICAL AND ASTRONOMICAL GEOGRAPHY. Price 4s. 6d. Fully illustrated Model Lessons on the Form and Motions of the Earth, Seasons, Tides, Eclipses, Winds, Currents, Latitude and Longitude, &c.

"Exceedingly well done."—*The Journal of Education*.

5. COWHAM'S MANUAL OF WRITING. Price 1s. Supplementary Exercise Book, price 6d. A complete preparation for the Practice and Teaching of Writing.

6. FRACTIONS AT A GLANCE. Price 2s. 6d. A Chart designed to make the Teaching of Fractions both intelligible and interesting.

7. COWHAM'S SCHOOL JOURNEY. Price 2s. 6d. Three School Journeys fully illustrated by Maps, Plans, Sections, and Photographs. A form of NATURE STUDY.

Prof. SEELEY in *School World* writes:—"An excellent record of what has been done in a school outing."

MURRAY'S SCHOOL HISTORY OF ENGLAND.

AN OUTLINE HISTORY OF ENGLAND FOR THE MIDDLE FORMS OF SCHOOLS.

By M. A. TUCKER,

formerly Marion Kennedy Student at Newnham College, Cambridge.

With Coloured Maps and Plans. Crown 8vo, 2s. 6d.

MURRAY'S SMALL CLASSICAL ATLAS FOR SCHOOLS.

Edited by G. B. GRUNDY, M.A., D.Litt.,
Fellow and Tutor of Corpus Christi College, Oxford.

Folio (14½ × 9½ INCHES). Price 6s.

CONSISTING OF 14 SHEETS (CONTAINING 38 MAPS AND PLANS) WITH A COMPLETE INDEX OF 19 PAGES.

"Mr. Murray has laid the classical student under another debt of obligation by this splendid atlas, which reflects the greatest credit on both author and publisher. Every map is beautifully printed, not one being overcrowded. The price (6s.) is remarkably low; the marvel is that so good a work can be produced at the price."—*Secondary Education*.

"It is quite certain that classical atlases for schools have been miserably inefficient; and Mr. Grundy seems to us to have succeeded in making good some of the principal deficiencies."—*Saturday Review*.

"We may say at once that this new classical atlas is so good that it will presumably become the standard work of the kind."—*School*.

A FURTHER COURSE OF PRACTICAL SCIENCE.

Mechanics, Hydrostatics, and Heat. By J. H. LEONARD, B.Sc. (Lond.), and W. H. SALMON, B.A., B.Sc. With Illustrations, Diagrams, and Exercises at the end of each Chapter. Fcap. 8vo, 2s.

This Book is a continuation of the "First Course of Practical Science" (1s. 6d.), by Mr. J. H. Leonard. These two works, together with the "First Course of Chemistry" (1s. 6d.), by the same Author, cover between them all the ground included in the Oxford and Cambridge Local Examinations under the following heads:—Elementary Science (Juniors) and Heat (Juniors); also treat (Preliminary, Cambridge), Elementary Mechanics (Juniors, Cambridge), and Elementary Mechanics and Hydrostatics (Juniors, Oxford).

ARITHMETIC MADE EASY: Lectures on Method, with Illustrations for Teachers and Pupils. By MAUEL A. MARSH. Crown 8vo, 2s.

This Manual applies the heuristic method to Arithmetic Teaching, and is specially recommended for use in Training Colleges, and for all members of the teaching profession.

GRAMMAIRE FRANÇAISE: a French Grammar for the use of the Middle Classes in Schools. By W. MANSFIELD POOLE, M.A., and MICHEL BECKER. 2s. 6d.

FRENCH and GERMAN PICTURE VOCABULARY: in Phonetic and Ordinary Transcript. By W. MANSFIELD POOLE, M.A. Crown 8vo, 3s. 6d.

THE INTERMEDIATE FRENCH READER. Edited, with Historical, Biographical, and Grammatical Notes, by MAURICE A. GEROTHWOHL, B.Phil., L. ex L., F.R.S.L., Examiner to the Oxford and Cambridge Schools Examination Board. Crown 8vo, 2s. 6d.

NATURE TEACHING: Based upon the General Principles of Agriculture. For the use of Schools. By F. WATTS, B.Sc., and W. G. FREEMAN, B.Sc. Large crown 8vo, 3s. 6d.

GEOMETRY: an Elementary Treatise on the Theory and Practice of Euclid. Having in view the New Regulations of the Oxford and Cambridge Local, the London Matriculation, the Board of Education, and other Examinations. By S. O. ANDREW, M.A., Head Master of Whitgift Grammar School, Croydon. Third Impression. Fcap. 8vo, 2s.

ALGEBRA. In Two Parts. By F. M. LANGLEY, M.A., Senior Mathematical Master, Modern School, Bedford; and S. R. N. BRADLY, M.A., Mathematical Master, Modern School, Bedford. Fcap. 8vo. Part I. (Second Impression), 1s. 6d.; Part II., 2s.

MR. MURRAY'S PRIMERS.

Fcap. 8vo, 1s. each.

A PRIMER OF PHILOSOPHY. By A. S. RAPPOPORT, Ph.D.
"An exceedingly able summary. . . . We hope to read it again and again."—*Academy*.

A PRIMER OF PHYSIOLOGY. By Prof. E. H. STARLING, F.R.S.
"The nearest approach to the ideal primer of physiology that has yet been produced."—*Education*.

THE USE OF WORDS. By Miss GEORGINA KINNEAR.
"Is really wonderful."—*School World*.

JOHN MURRAY, ALBEMARLE STREET, W.

SCHOOL:

A Monthly Record of Educational Thought and Progress.

Edited by R. B. LATTIMER, M.A.

DEMY 4to. SIXPENCE NET.
ANNUAL SUBSCRIPTION, 8s. POST FREE.

The Publisher will be happy to send a Specimen Copy free on application.

The object of "SCHOOL" is to keep in touch with all developments of Education; to give its readers an interest in the questions which the recent change of system has inaugurated, and in the efforts made towards the solution of the problems of the day.

It is hoped that teachers, pupils, and the general public will find in its pages a stimulating record of progress, and useful and healthy practical assistance in the science of teaching.

Many leading educational experts have expressed their sympathy with "SCHOOL" and its objects, and special articles are being contributed from time to time by acknowledged leaders of thought in their own particular branches of Educational Science.

JOHN MURRAY, ALBEMARLE STREET, W.

Mr. W. E. Curnock, who has been appointed head of the Mechanical Engineering Department of the Technical College, Huddersfield.

SCHOOLS.

CHELTEMHAM, LADIES' COLLEGE.—The following pupils have passed the examination for the Teachers' Diploma of the University of Cambridge:—P. Dumaresq, M. Liddiard, K. Ames, K. de Glanville, A. Hele, E. Hutchinson, E. Neal, K. Fuller. Of these, Miss Dumaresq and Miss Liddiard obtained a First Class in Practice.

CLAPHAM HIGH SCHOOL.—In the Secondary Training Department, the Cambridge Teachers' Certificate was gained by Miss Phillimore and Miss Blenkarn, and the London Teachers' Diploma by Miss L. Oram and Miss E. Oram. In the examinations of the National Froebel Union the following certificates were gained:—Elementary Certificate: Misses V. Noble (Certificate of Distinction), D. Barrett, T. Jack, C. Parr, V. Pegler, J. Purvis, R. Whitten, B. West Watson. Higher Certificate: Part I.—Misses M. Cottingham and M. Köster; Part II.—Misses L. Bury (First Class Certificate), K. Burgis, W. Hopwood, M. Ward, W. Maynard (Distinction in Blackboard Drawing), F. Snell (Distinction in Blackboard Drawing), C. Edwards (Distinction in Gifts and Occupations and Blackboard Drawing). In the Local School Examinations of the Associated Board of the Academy and Royal College of Music, Piano (Higher Division), the following passed:—R. Barber, M. Barnard, L. Harrison, G. Lewis, D. Lidiard, K. O'Connor; Harmony (Higher Division), E. Blaxland (Honours). Local Centre Associated Board Examination:—Piano: Intermediate Grade—H. Thornton; Advanced Grade (Special Certificate)—G. Cockrell. Metropolitan Examination: L.R.A.M. Diploma—I. Bideleux.

HARROW.—Mr. Frank Marshall has, to the universal regret of the school and the neighbourhood, resigned his mastership after thirty-five years of service. He has done much to advance mathematical study at Harrow, and he was no less keen in promoting music and natural history. His house was deservedly one of the most popular. Sir A. Hott succeeds him as house master.

NORTHWICH HIGH SCHOOL.—The distribution of prizes took place on Monday, December 19. French, Latin, and English recitations, songs, and musical drill were given by the pupils. Six girls passed the Oxford Local Examinations, and many First Class certificates were gained in Science, Mathematics, and Drawing in the Board of Education examinations.

PORTSMOUTH, GIRLS' HIGH SCHOOL.—Dorothy Brookes has obtained her L.R.A.M. Miss K. Thompson has left, and the mathematical work is being taken by Miss E. S. M. Baguley, while Miss C. A. Morin has filled Miss Hogg's place as kindergarten mistress.

ST. OLAVE'S GRAMMAR SCHOOL.—The following are the recent successes obtained by boys in the school:—E. J. Cushion, an exhibition of £40 a year at King's College, Cambridge, for Classics; S. W. Grose, an exhibition of £30 a year at Christ's College, for Classics; E. W. Harber, an exhibition of £30 a year at Trinity Hall, for Natural Science; and T. J. Wood, an exhibition of £20 at Queens' College, for Mathematics.

WOLVERLEY SCHOOL, KIDDERMINSTER.—The following have been elected to entrance scholarships:—Montagu Travers Morgan, William Percy George Bullock, George Gerald Randall Bott, Arthur Kenelm Swallow, John Norman Butler.

OBITUARY.

HENRY WEIR.

MANY Scotsmen will learn with regret the death of Mr. Henry Weir, M.A., who for nearly the life-time of a generation was the most popular master of the Edinburgh Academy. In his day, a boy entered under a particular master, with whom he remained all his school life; and Mr. Weir took such a lead in this competition for pupils that his classes often numbered not far short of a hundred. To do justice to such numbers is not in mortal man; but Mr. Weir went far towards the impossible by remarkable devices of pedagogy that deserved fuller note. He made his personality felt in a union of Cambridge scholarship with the humorous shrewdness of an old Scotch dominie, and it may be mentioned that he kept his huge classes in order with hardly any need for punishment; while those who cared to learn know well how much they owe to his teaching. Among the many pupils who passed through his hands were the Duke of Argyll, Lord Francis Douglas, killed on the Matterhorn, the Lord President of the Court of Session, the Attorney-General, Sir Thomas Raleigh, and a host of men who have made their mark in the professions. After being pensioned off by the school to which he gave so much of his life, he tried coaching work in London, and almost to the end showed singular alertness of mind in taking up the study of fresh languages. He died at Chiswick on December 3, aged eighty-eight.

SMITH, ELDER, & CO.'S LIST.

TRAGIC DRAMA IN ÆSCHYLUS, SOPHOCLÆ, AND SHAKESPEARE. An Essay. By LEWIS CAMPBELL, M.A., Oxon., LL.D., Glasgow, Hon. D.Litt. Oxon., Emeritus Professor of Greek at the University of St. Andrews, &c. Large post 8vo, 7s. 6d.

STUDIES FROM ATTIC DRAMA: The House of Atreus, being a Representation in English blank verse of the Agamemnon of Æschylus; and **Alcestis, a Play,** after Euripides. By EDWARD GEORGE HARMAN. Crown 8vo, 5s.

QUEEN VICTORIA: A Biography. By SIDNEY LEE, Editor of the "Dictionary of National Biography." *New, Revised, and Cheaper Edition.* With Portraits, Map, and Facsimile Letter. Large crown 8vo, 6s.

* Also the *Fourth Impression (Second Edition)* of the Original Edition. With Portraits, Map, and Facsimile Letter. Large crown 8vo, 10s. 6d.

A LIFE OF WILLIAM SHAKESPEARE. By SIDNEY LEE, Editor of the "Dictionary of National Biography." *Fourth Edition.* With a Portrait of Shakespeare, a Portrait of the Earl of Southampton, and Facsimiles of Shakespeare's known Signatures. Crown 8vo, 7s. 6d.

* Also the *Illustrated Library Edition*, in 1 volume, medium 8vo, profusely illustrated with Photogravures, Topographical Views, &c. 15s.; and the *Student's Edition*, with Photogravure Plates and Four Full-Page Illustrations, crown 8vo, 2s. 6d. net.

THE INDIAN EMPIRE: Its People, History, and Products. By Sir W. W. HUNTER, K.C.S.I., C.I.E., LL.D. *Third and Standard Edition.* With Map. Demy 8vo, 23s.

SHAKESPEARE COMMENTARIES. By Dr. G. G. GERVINUS, Professor at Heidelberg. Translated under the Author's superintendence by F. E. BURNETT. With a Preface by F. J. FURNIVALL. *Seventh Edition.* 8vo, 14s.

SHAKESPEARE. — CERTAIN SELECTED PLAYS ABRIDGED FOR THE USE OF THE YOUNG. By SAMUEL BRANDRAM, M.A. Oxon. *Fourth and Cheaper Edition.* Large crown 8vo, 5s.

Titles of the Plays: The Merchant of Venice—Romeo and Juliet—A Midsummer Night's Dream—Much Ado about Nothing—Twelfth Night—As You Like It—Hamlet—Macbeth—The Tempest.

* Also the Nine Plays separately. Crown 8vo, neatly bound in cloth limp, 6d. each.

THE HISTORICAL SERIES FOR BIBLE STUDENTS. Edited by Prof. CHARLES FOSTER KENT and FRANK KNIGHT SANDERS.

Volume I.—**History of the Hebrew People:** from the Settlement in Canaan to the Division of the Kingdom. By Prof. CHARLES FOSTER KENT. With Maps and Plans. Crown 8vo, 6s.

Volume II.—**History of the Hebrew People:** from the Division of the Kingdom to the Fall of Jerusalem in 586 B.C. By Prof. CHARLES FOSTER KENT. With Maps and a Chart. 7th Edition. Crown 8vo, 6s.

Volume III.—**History of the Jewish People:** The Babylonian, Persian, and Greek Periods. By Prof. CHARLES FOSTER KENT. With Maps. Crown 8vo, 6s.

Volume IV.—**History of the Jewish People:** The Maccabean and Roman Periods. By Prof. J. S. RIGGS, D.D. Crown 8vo, 6s.

Volume V.—**The Life of Jesus of Nazareth.** By Prof. RUSH REES. Crown 8vo, 6s.

Volume VI.—**Christianity in the Apostolic Age.** By Prof. GEORGE T. PURVES, Ph.D., D.D. Crown 8vo, 6s.

Volume VII.—**History of the Babylonians and Assyrians.** By Prof. GEORGE S. GOODSPEED, Ph.D. Crown 8vo, 6s.

Other Volumes to follow.

Prepared for the Department of Science and Art, and used by the School Board for London.

PHYSIOLOGICAL DIAGRAMMS. By the late JOHN MARSHALL, F.R.S., F.R.C.S., Professor of Surgery, University College; Surgeon to the University College Hospital, and Professor of Anatomy to the Royal Academy. Eleven Diagrams, life-size, each on Paper 7 ft. by 3 ft. 9 in.

- No. 1.—The Skeleton and Ligaments.
- No. 2.—The Muscles and Joints, with Animal Mechanics.
- No. 3.—The Viscera in position—The Structure of the Lungs.
- No. 4.—The Heart and Principal Blood-Vessels.
- No. 5.—The Lymphatics or Absorbents.
- No. 6.—The Digestive Organs.
- No. 7.—The Brain and Nerves.
- No. 8.—The Organs of the Senses, Plate 1.
- No. 9.—The Organs of the Senses, Plate 2.
- No. 10.—The Microscopic Structure of the Textures and Organs, Plate 1.
- No. 11.—The Microscopic Structure of the Textures and Organs, Plate 2.

Each Sheet sold separately, price 12s. 6d., coloured in facsimile of the Original Drawings; or £1. 1s. each, mounted on canvas, with rollers and varnished. Explanatory Key, 16 pp., 8vo, price 1s. Illustrated Prospectus post free on application.

Diagrams Nos. 1, 3, 4, and 6 are especially adapted for use in Pupil-Teachers Centres and Certificate Classes as aids in the instruction of Domestic Economy.

By the same Author.

A DESCRIPTION OF THE HUMAN BODY: Its Structure and Functions. *Fourth Edition.* 4to, with folio Atlas, 12s. 6d.

Illustrated by reduced copies of the Author's "Physiological Diagrams," to which series this is a companion work. Designed for the use of Teachers in Schools and young men destined for the Medical Profession, and for popular instruction generally. The work contains 260 4to pages of text, bound in cloth, and 240 Coloured Illustrations, arranged in 11 folio plates, measuring 15 in. by 7½ in., in a limp cover.

Catalogue post free on application.

LONDON MATRICULATION.

SUITABLE BOOKS IN
The University Tutorial Series.

ENGLISH.

Matriculation English Course. By W. H. LOW, M.A. Lond., and JOHN BRIGGS, M.A. Camb., F.Z.S. Second Edition. 3s. 6d.

ELEMENTARY MATHEMATICS.

Algebra, The New Matriculation. Containing a Section on Graphs. By RUPERT DEAKIN, M.A. Lond. and Oxon. Third Edition. 3s. 6d.

Arithmetic, The Tutorial. By W. P. WORKMAN, M.A., B.Sc. Second Edition. 4s. 6d.

Euclid. Books I.-IV. By R. DEAKIN, M.A. Lond. and Oxon. With a Preliminary Course of Drawing and Measurement, and Problems in Practical Geometry. 2s. 6d.

Graphs: The Graphical Representation of Algebraic Functions. By C. H. FRENCH, M.A., and G. OSBORN, M.A. 6d. Cloth, 9d.

LANGUAGES.

French Course, The Matriculation. By ERNEST WEEKLEY, M.A. Lond. and Camb. 3s. 6d.

French Reader, The Matriculation. Containing Prose, Verse, Notes, and Vocabulary. By J. A. PÉKKER, Officier d'Académie, University of France, Examiner and Member of the Board of Medieval and Modern Languages in the University of London. 2s. 6d.

Greek Reader, The Tutorial. By A. WAUGH YOUNG, M.A. Lond. With the Greek Unseens set at Matriculation from 1875 to 1903. 2s. 6d.

Latin Authors, Matriculation Selections from. By A. F. WATT, M.A. Oxon., and B. J. HAYES, M.A. Lond. 2s. 6d.

Latin Composition. By A. H. ALLCROFT, M.A. Oxon., and J. H. HAYDON, M.A. Lond. Fifth Edition. 2s. 6d.

Latin Grammar, The Tutorial. By B. J. HAYES, M.A. Lond. and Camb., and W. F. MASOM, M.A. Lond. and Camb. Fourth Edition. 3s. 6d.

Latin Unseens, Matriculation. Being the Passages set for translation from Unprescribed Books, 1875 to 1903. 1s.

HISTORY.

Modern History, Matriculation. 1485-1901. By C. S. FEAKENSIDE, M.A. Oxon. 3s. 6d.

Greece, The Tutorial History of. By W. J. WOODHOUSE, M.A. Oxon. 3s. 6d.

Rome, The Tutorial History of, to 14 A.D. By A. H. ALLCROFT, M.A. Oxon., and W. F. MASOM, M.A. Lond. 3s. 6d.

SCIENCES.

Botany, The New Matriculation. By A. J. EWART, D.Sc. 3s. 6d.

Chemistry, The New Matriculation. By G. H. BAILEY, D.Sc. Lond., edited by WM. BRIGGS, LL.D., M.A., F.C.S. Second Edition (Re-written and Enlarged). 5s. 6d.

Hydrostatics, The Matriculation: An Elementary Text-book of Hydrostatics. By WM. BRIGGS, LL.D., M.A., and G. H. BRYAN, Sc.D., M.A., F.R.S. Second Edition. 2s.

Magnetism and Electricity, Second Stage. By R. W. STEWART, D.Sc. Lond. Second Edition. 3s. 6d.

Mathematics, Matriculation Advanced (Algebra and Geometry). Edited by WM. BRIGGS, LL.D., M.A. 4s. 6d.

Mechanics, The Matriculation: An Elementary Text-book of Mechanics. By WM. BRIGGS, LL.D., M.A., and G. H. BRYAN, Sc.D. Second Edition. 3s. 6d.

Physics, Matriculation: Heat, Light, and Sound. By R. W. STEWART, D.Sc., and JOHN DON, M.A., B.Sc. 4s. 6d.

Trigonometry, The Tutorial. By WM. BRIGGS, LL.D., M.A., F.R.A.S., and G. H. BRYAN, Sc.D., M.A., F.R.S. 3s. 6d.

List of Books for London University Examinations, including the Special Subjects for Inter. Arts and B.A., 1905 and 1906, Oxford and Cambridge Locals, and College of Preceptors, &c., Post Free.

Quarter Page ...	1 15 0	One-Eighth Page ...	0 17 6
Per Inch in Column, 8/-.			

PREPAID RATES FOR SCHOOL ANNOUNCEMENTS—

Scholarships, Official Notices, School Transfers, Partnerships, &c.—6d. per line; minimum charge, 5s.

Posts Wanted or Vacant.—30 words for 2s.; each 10 words after, 6d.

Lectures, Classes, Non-Resident Posts, &c.—48 words for 3s.; each 8 words after, 6d.

An extra fee of ONE SHILLING is charged on advertisements with OFFICE ADDRESS.

Date of publication of next issue will be found at top left-hand corner of front page. [Advertisers are reminded that "Letters addressed to INITIALS or to FICTITIOUS NAMES, or to a CHRISTIAN NAME without a SURNAME," at Post Offices are not taken in, but are sent at once to the Returned Letter Office.]

All Letters respecting Advertisements and Subscriptions should be addressed—"THE PUBLISHER," JOURNAL OF EDUCATION OFFICE, 3 BROADWAY, LUDGATE HILL, E.C. Money and Postal Orders, on the Post Office, Ludgate Circus, E.C., should be made payable to WILLIAM RICE; Orders and Cheques may be crossed, "The London City and Midland Bank, Ludgate Branch." Postage stamps can only be received at the rate of thirteen to the shilling.

If a receipt is required for an advertisement under 10s., a postcard or a stamped envelope must be enclosed.

Notice must be given of all remittances through the Post Office from abroad, stating full name and address of the sender; and all Foreign Money Orders must be crossed for payment through a Bank.

LONDON: WILLIAM RICE, 3 BROADWAY, LUDGATE HILL, E.C.

A COMPARISON BETWEEN ENGLISH AND FRENCH SECONDARY SCHOOLS.*

By CLOUDESLEY BRERETON.

(Continued from page 29)

LET us now pass to a consideration of curricula in the two countries. In France, as you know, a great reform has just taken place. The new programme has been so arranged that the secondary proper part of the *lycée* serves as a continuation school to primary education. Furthermore, the secondary proper stage is divided into two courses, each complete in itself, one finishing at fourteen or fifteen and the other at seventeen or eighteen, each section corresponding roughly to the German distinction between the *Realschule* and the *Oberrealschule*, though pupils leave a year sooner. Unlike the German schools, in which sides are comparatively rare, the French schools begin with a bifurcation at the outset between classics and a modern education. These in the second cycle become further differentiated into four different courses—the Greek-Latin, the Latin-Modern Languages, the Latin-Science, and the Science-Modern Languages. In some ways the new reform recalls the *Frankfurter Lehrplan*. Languages are taken up singly and studied on the intensive system, while modern languages are studied before classics.

It seems unlikely that all these four types will always be found in all schools, and many apprehensions have been expressed as to the ultimate fate of classics. The French Government have, in fact, established a sort of universal suffrage on the part of the parents as to which courses shall be maintained or discontinued; for the choice of the parents will ultimately decide the fate of the less popular courses in the majority of localities. Until a month ago the organization of English secondary education was more or less chaotic. The recent Regulations for Secondary Schools recognize, however, three types—classical, modern, and commercial, each type with a leaving age of nineteen, seventeen, and sixteen—that is to say, nine sorts of schools in all. The school authorities are

* Lecture delivered to the students at the London University Holiday Course, August 8, 1904.

allowed, as has been already stated, to draw up their programmes subject to the central control, and in certain cases "sides" will be allowed. They will, therefore, be able to adapt their curricula to local needs and, in fact, the utmost elasticity will be allowed, subject to the conditions that the programme shall give, on the whole, a general education with at least a four years' course. We shall have to trust to inspectors for seeing that the standard in these various schools is maintained. Theoretically we shall thus have a system even more flexible than the French, but it will be some time before we are able to get it into full swing, more especially as those schools which do not receive public grants are still to a great extent a law unto themselves.

The teaching of the different subjects is sufficiently important to serve as the basis for an entire lecture. Here I can only emphasize one or two points in which there is a striking divergence of aim. To take the mother tongue first. While the English boy mainly studies classics for their own sake, the French boy rather studies them for the assistance they give to a fuller and more complete expression and appreciation of his native language and literature. The mother tongue is often sacrificed to classics in England; but in France, if anything is sacrificed, it is rather classics to the mother tongue. Many scholars in England still believe that English is best incidentally picked up through learning Latin, as if the best view of Nature were to be obtained through coloured spectacles. Happily, the opposite is maintained by the reformers in modern language teaching. They insist that a good grounding in the mother tongue is indispensable, and their views are everywhere gaining ground. The insistence of the "New Methodists" on the need of developing the oral side of modern language teaching must also have its effect on the teaching of the mother tongue. People must sooner or later realize the absurdity of aiming at fluency in modern languages while leaving the pupils tongue-tied in their own native speech. France offers us a most valuable example of the way in which oral narration in the mother tongue is made preparatory to the practice of written composition. Equally valuable is her example in the methods of teaching composition itself. The practice of translation from foreign languages has made the majority of our schoolmasters blind to the fact that style means something much more than mere grammatical accuracy or nice phraseology. Composition to their minds too often means a mere reproduction in a Latin or Greek medium of some passage taken from an English writer, which is really a matter of fitting in the right word or phrase, of reproducing in a classical mosaic a design already given in English. They fail to recognize its fuller, truer, and really classical meaning of composing, of putting together, of construction. They thus confound the talent of the mosaic layer with the perfectly different one of the original artist.

The French insist that all their pupils should prefix to their compositions a plan or skeleton which indicates the line of thought they have taken. We might well copy this example. In the same way we might imitate their methods in the teaching of literature. At present our school editions of standard authors are so over-annotated that the pupils study the notes and neglect the text.

In classics, again, the aim in the two countries appears to be different. In France Greek and Latin would appear to be treated rather as a means of literary and rhetorical training, whereas in England they are rather used as an instrument of mental discipline. The ideal in the one country is rather culture, in the other scholarship. While we lay stress on the "*didicisse fideliter artes*," and expect the "*emollit mores*" to follow as a matter of course, the French would rather seem to lay stress on the "*emollit mores*." The standard of classical attainment in our English schools is probably higher by reason of the disproportionate time given to those subjects in the school time-table; yet it is probable that, owing to the prolonged preparation required by the *agrégation* and the *doctorat*, there is in the end nothing to choose between the best French and English scholarship, the only difference being that we use up more raw material in the process in the shape of unsuccessful students. For the teaching of modern languages both nations have now adopted more or less the New Method. Probably the French have made more rapid progress in the last few years, as the State schools have one and all been obliged to follow the new departure, while with us the chief

force is an enlightened public opinion backed by the crusade of a few ardent reformers.

In the teaching of history the French programmes have been recently altered with a view to eliminating to a certain extent the battle and siege element in order to find more room for constitutional and social history. At the same time general notions are given of ancient history, which is really the embryology of our civilization. English history is probably unique in its long sequence of orderly growth and development, but its very length makes it difficult to cover the whole ground. We are still too much hampered by studying history in watertight compartments, called "reigns." We forget that, though "The King is dead," "Long live the King!" follows immediately after, while the world very often goes on much as usual. We need to study our history—at least, at first—more under the form of movements. At the same time, we scarcely make enough use of history for the teaching of patriotism—not, Heaven forbid! of the Jingo "Let 'em all come" type, but as the annals of the race, in making the pupil realize that he is the descendant of a people whose nationality is more than a thousand years old.

Geography in France is still mainly connected with history. The recent school of reformers in England would rather connect it with science. This seems only logical. History does not explain geography, but geography history; and geography, as its German name implies, begins with the study of physical features and then proceeds to their effects on political geography. In mathematics the French teacher possesses, or possessed till recently, two great advantages over his English *confrère*. He has no complicated weights and measures to drill into the smaller boys, nor is his teaching of geometry hampered by having to be given in the antiquated form of Euclid. Moreover, the French arithmetic is not overloaded with a mass of recipes for sums which are far more easily solved by algebraical methods. We have at length banished Euclid from our schools; we are permitting a much wider use of algebraical symbols; but we are still tied and bound by the chain of our weights and measures.

In science, and especially in the teaching of practical work, the English schools are probably ahead of the French. M. Liard has recently said that what was wanted in France at the present time was a great bath of science. We may, therefore, expect a large increase in the bath-rooms of science—to wit, laboratories—in the near future. There is, however, one subject which figures conspicuously on the French time-table but which is only touched on incidentally in English schools—I mean philosophy. As taught in French schools it serves not merely as a *résumé* and *Erklärung* to the pupil of his previous education; it also provides him, as it were, with mental pigeon-holes in which to distribute his future experience.

The mere fact of teaching the pupil to examine, analyse, and classify his ideas and arrange them in a coherent whole seems to me to be of the highest value. Unification of ideas and personality are closely connected. Nor is the training merely one in logical thinking. Quite a third of the course is taken up with the study of *la morale* proper, whereby the pupil acquires definite principles and ideals for his future life as an intelligent being and as a citizen in a free State. I cannot help feeling that our home-bred contempt for theory would be lessened were such a sort of training given in our schools. And, to judge by the report of the head masters for the province of Saxony in Prussia a year or two back, the same need is felt in German schools. Obviously we must have something clear and lucid like French philosophy—which is not, however, by any means so shallow as many think at first blush. The depth is really there, but the bottom is seen so easily because the *milieu* is so transparent.

I now pass to what, after all, is the most important part of the schools themselves—the boys; and, first, I would say a word on the question of mental maturity. If power to express oneself with comparative facility and clearness, to seize readily the gist of questions and to handle with relative ease abstract and philosophical ideas be signs of maturity of mind, the French pupil is certainly in advance of the English boy of the same age. Undoubtedly, again, his literary and æsthetic sympathies are correspondingly more developed. Some of this intellectual expertness must be set down to the fact that secondary education in France goes back even still further than secondary education in England; and that, while the

Universities and the schools had also their dark age in the middle of the eighteenth century, the traditions of "bien dire" and "bien écrire" were never lost. But a still greater part of this apparent precocity is due to race and environment. The French are naturally quick and vivacious; they have a mind that leaps to conclusions (*prime-sautier*). Happily the leap is generally correct, though, if they go past the point, it is often a little difficult to bring them back to it. Again, the French boy and the French girl come to physical maturity earlier than the English. One has only to compare the whiskered and bearded pupils who are not uncommon in the upper classes of the *lycée* with the comparatively smooth-faced English boys of the same age in order to realize the difference. Having gone so far, I feel I must now go the whole hog, and attempt, though the task will be a difficult one, to give a short sketch of the French boy and his English *copain*. I will not do more than allude to the lack in French education of the large social side of school life which has so profound an influence for good on the English boy. In the light of certain unfavourable circumstances that affect his bringing up, I am always surprised at the wonderful possibilities in the French boy's character, and inclined to attribute the majority of his faults to the untoward influences mentioned above. No one, I think, can fail to be struck with the quickness and sureness of his intelligence. He is naturally polite, obliging in the small things of life, affable, and cheerful. He possesses to the full that appreciation of life which is the mark of his race. For him the question is not whether life is worth living, much less whether it is a bore, but how he can best get the most out of it by way of pleasure and amusement. As art to the Greeks was not synonymous with mere monetary outlay, so the French boy does not confound pleasure and expense. He is therefore generally in good spirits; and, if he is rather fond of "la blague" (a curious admixture of conceited exaggeration and intentional humbugging), are our boys always devoid of swagger or of trying to "green" a "new chum"? Again, is not this inflated manner of talking, when applied to the authorities, a subtle way of taking his revenge on the despotic *régime* under which he fancies he groans and which he thus hopes to temper with his epigrams. That he is a "frondeur" at times cannot be denied, yet here again it is, no doubt, because he feels that such an attitude is the only one by which he can maintain his independence in the presence of an authority more intent on imposing itself than on getting itself accepted ("Sentie plutôt que consentie"). If he is rather lacking in endurance, can one blame him, when one sees how everything conspires to keep him dependent on his parents? Our boys of sixteen and seventeen have often a regular allowance, on which they are expected to clothe themselves and defray their out-of-pocket expenses. Occasionally deficits occur which result in forced contributions from the parents, but the system of making a boy manage his own income and balance his own budget works, on the whole, very well. The French boy, as far as one can learn, has no such financial liberty while at school.

I now pass to the English boy. To describe the life of the English boy at school is often—at least, as far as the boarder is concerned—to describe the happiest years of his whole life. It begins in his preparatory school, in which, life, if anything, is made too easy for him. It continues on through the public school, which he enters at the age of thirteen or fourteen. But probably the best time of all comes with the years sixteen to eighteen or nineteen, when he begins to be some one in the school: is made a house or school monitor, gets into the sixth form, and plays for the school at cricket or football. The present is so bright and so absorbing that he scarcely thinks of the future at all. If it is present in his mind, it is only as a vague and not unpleasing contingency. Every year sees him clothed with wider authority and prestige. The healthy open-air life, the pleasurable sensation of growth—even if they rarely rise above the level of sub-consciousness—form a solid foundation to the joys of his existence. His *milieu* is in sympathy with him, and he with his *milieu*. If life means not merely a preparation for each successive stage, but also the living out of each stage as if it were an end in itself, then as regards the latter ideal the English educator may be held to have come nearer the mark than any other modern educator. Boyhood is certainly not sacrificed. The severest critics of the system can only say that it is unduly prolonged, and that, while we make in many ways the transition to manhood easier than elsewhere,

we neglect the intellectual side too much, and defer till too late the idea that a choice of a career is imperative on all. We do not sufficiently insist that a career should not merely be a sort of *pis aller*, a kind of refuge for the destitute, a *corvée* imposed on us by the stern necessity of having to earn our daily bread; but a calling, a vocation, a life-work in the highest sense.

Gray, no doubt, was right, in the main, when, watching the boys at their games, he wrote:

Where ignorance is bliss, 'tis folly to be wise;

but there is a point at which ignorance unduly prolonged leads to a rude awakening. The portals of every profession are getting every day more crowded, and entrance and subsequent success depend more and more on early preparation—not specialization, but self-preparation, self-dedication, if the word is not too strong, to the career one intends to follow. The day of the amateur in all professions is slowly passing away, and it is more and more being realized by the thoughtful that education, in order to prevent the multiplication of *non-valeurs* and waste products, must more and more undertake the task of organizing the selection, not so much by constructing an elaborate system of examinations—sieves for sifting out the unfit—as by adding to its duties that of impressing on the young the need of choosing a profession and taking, if possible, an interest in it while still at school. With all the insistence that our education lays on the cult of activity and the cultivation of the will, it seems somehow to have forgotten that these pure sciences need also to be taught in an applied fashion to be really fruitful. We turn out hundreds blessed with good intentions and strong in potential energy; but we neglect to teach the application of these to the task of daily life. "Vis consili expers, mole ruit sua." The State receives batch after batch of well affected citizens who have, however, been but ill-trained in one of the most important branches of citizenship—that of adding to its general productivity by being an efficient worker. We have got to add to the catalogue of virtues taught at school the virtue of the producer. No doubt the *city* boy, who passes his time half at home and half at school, lives in a more varied atmosphere than the boarder; but, none the less, there is scarcely a secondary day school in the country to which the influence of the public-school tradition does not extend. If it was not in the school originally, it has been brought there by members of the staff, who, being old public-school boys, have acted like missionaries in sowing the good seed through the length and breadth of the land. What is the tradition? A *résumé* of the works of Thomas Arnold and Edward Thring and of their numerous disciples, with readings in "Tom Brown," would alone give an adequate idea of its many-sided variety.

But, if one desired to sum up the dominant character of its spirit, apart from the religious basis on which its founders placed it, one must strangely enough have recourse to our French neighbours, who in this, as in so many other matters, have done its thinking for Europe. To them we owe the coinage of two phrases, "noblesse oblige" and "esprit de corps." The former, Norman and aristocratic in origin, is an epitome of all the virtues that formed the stock in trade of the ancient schools of chivalry and mediæval knighthood; the latter, more in sympathy with the Anglo-Saxon spirit, embodies the old civic ideal of a living corporation and the modern conception of organic oneness. In these two phrases all moral and civic instruction seems to be comprised—the one laying stress on the obligations of the individual to himself and other individuals, the other on his duties to his fellow-citizens and to the State. No doubt to Thring and Arnold the ideal of school was not merely that of a republic of free aristocrats, but a veritable "civitas Dei." Just as the mediæval doctors wove into the fabric of their religious belief many of the doctrines they found in those pre-Christian doctors of the Church, Plato and Aristotle, so the leaders of the educational renaissance of the nineteenth century found much of their inspiration in the classical and knightly traditions of the past in their desire to give an education not only of a Christian, but of a gentleman, to make the schools in the widest sense schools of manners.

In studying the manners of the English public-school boy a foreigner would probably be struck by his frankness, independence, absence of swagger or affectation, and easy assurance, which consisted of a large dose of self-satisfaction, probably

well grounded, and tinged with a cheerful disregard of, or indifference to, the opinions of strangers, not unmixed with contempt, when they were not of the same way of thinking as himself. On the other hand, he would note a curious readiness to swear by everything enunciated by those who were the bell-wethers of public opinion within the school itself, and would realize that the Englishman's preference for men rather than measures goes deep into the national character. A closer acquaintance would probably show that he had a regard for truth and a keen sense of honour; that he could keep his temper; that he had pluck and endurance; and did not boast about what he had done, if he did not rather ape humility in pretending to pooh-pooh it altogether; that he was loyal, honest, and trustworthy; his extremely limited vocabulary of English undefiled would astonish our foreign friend, who would be further bewildered by his flow of slang; nor could the amazement of the critic diminish on learning that this very slang was regarded as part and parcel of the school life, and any attempt of the authorities to put it down would involve a language question to which even Bohemia could offer no parallel. In fact, our critic would speedily discover that the English boy is intensely and violently conservative, that procedure is his principal guide in life, and precedent its chief illumination; that Mrs. Grundy's reign in the social world is nothing to the cast-iron *régime* which rules within the precincts of Harchester; that innovation can only come when Brown *primus*, the head of the school, or Jones *primus*, the captain of the eleven, decides to innovate; and neither, they all know, will ever innovate rashly. Our critic will also probably wonder at the narrow sphere of interest in which the pupil lives, and, while approving the zest he gets out of life, and the excellent terms on which he generally lives with those in authority, he will rate less highly his general ignorance of literature and art and pity his contemptuous attitude towards them. More remarkable still will seem to our foreign friend his absorbing interest in games—so much so that the former may, perhaps, ironically ask whether the schools themselves are not really gymnasiums in the literal sense of the word, whose aim is to produce a race of professional athletes, boatmen, and "sportmen" generally. He would be surprised to learn that, while in France the majority of young Frenchmen dream, from their earliest years, of obtaining a snug berth under the Government for the rest of their natural lives, the English boy is often so light-hearted that he has not seriously considered the future at all, but trusts to luck for "something to turn up."

Our critic will probably look with disapproval on the orgies that sometimes take place in the school tuck-shop, and be not unamused to learn—on remembering the "butter" towers of his own cathedrals, for which mediæval indulgences furnished the necessary funds—that modern gluttony had been utilized towards meeting the cost of substantial additions to the fives courts, and other athletic *desiderata* of the school. In religion our critic would discover that the pupil, as a rule, belonged to the Church of England as by law established, and that the numerous problems which engaged the mind of the philosophical youth of thirteen abroad rarely troubled the head of one whose piety, like that of his race, was mainly of a practical nature. One word in conclusion. No one is more conscious than myself of the imperfect and fragmentary nature of my comparison—I can only hope that I have not only indicated some of the defects, but also brought out the merits and strong points, of the two systems. At all events, I trust that the moral I would draw is plain—that it is the mutual advantage of the nations to profit by one another's experience.

"OUR COMPLICATED SYSTEM."

II.—CONCERNING THE TEACHING OF GEOMETRY.

THE indecision and indefiniteness of aim which have resulted in the present chaotic time-table of the ordinary public day schools underlie even the principles upon which they base their claim to exist. The discussions upon education at the last meeting of the British Association revealed the extent and mischief of this want of unity of aim. The one hopeful thing is that, with the reorganizing of secondary schools which makes possible for the first time some general survey and control of

a district by a responsible authority, the wasteful overlapping and jarring rivalry between different schools may be lessened. For any one worth being retained as part of the educational equipment of a locality may perhaps be required to formulate, and to adhere to, some one clear and definite aim. There is no need for each to emulate the Whiteley of retail commerce, and offer to adapt its curriculum to the winning of University scholarships in classics or literature, and at the same time to encourage early specialization in technical subjects—such as shorthand and building construction. Undoubtedly the temptation, even the need, for such adaptability, is keenly felt by the smaller grammar schools in provincial towns: but even they would be well advised to determine some limit to their endeavour to offer all wares in their small baskets. The large school that draws its pupils from all parts of the country as well as from the immediate neighbourhood may quite be able to have its "classical" and "modern" sides, and to prepare efficiently for the "University" or the "city." But for the small school, with but between one hundred and two hundred pupils, such combinations are not only undesirable but mischievous.

For, though there is no necessary divorce between sound learning and a "leaving certificate," the subjects and methods that conduce to the acquirement of the one are not of great value towards the obtaining of the other. When, therefore, the *raison d'être* of a school is to furnish the youth of the neighbourhood with the modern equivalent of the "three R's," together with the desired *modicum* of science and mathematics, this condition should be fairly faced and honourably fulfilled. An elaborate apparatus of examination machinery exists only to test these modest acquirements. But where there is no imperative demand for this necessarily narrow conception of education, there should be no paltering with wider aims merely to attract an additional pupil or two or to rival other organizations. We would say to one or more schools in every town where there are schools (deserving the name) of various grades: "Dare to be literary"; "Dare to proclaim your work to be the opening of the gates of knowledge—not the administering of little packets of marketable information"; "Dare to plan teaching and curriculum so as to develop faculty and inspire noble enthusiasms." It is a crushing conviction that much of the work of the teacher in preparing and imparting the intricate simplicities of the various "sections" of an examination schedule consists in reducing, rather than enlarging, capacity in the pupil; in hampering, instead of stimulating, intellectual enterprise; and in permanently staling things of truth and beauty which should be fresh and vivifying through life.

It is not only in such subjects as literature and history that this regrettable inversion is possible. The impatient clamour that seemed about to succeed in reducing the study of geometry to the level of paper-folding may have had its origin in the specialized needs of budding engineers; but much of its development is due to the misconception that technical expertness is a satisfactory substitute for grasp of principles. Certainly the one can be taught, while the other can only be striven for; the one can be brought within the range of Mr. Cocker's immortal encomium of his "Arithmetic"—"suitable to the meanest capacity," and the other involves at least a little wholesome climbing. The increased mental vigour, the developed *intellectual* expertness that result from the one have no counterpart in the mere possession of a larger number of mechanical tricks in the other. It may be that no one whose opinion is of any weight upon the matter of education, or of the special subject geometry, has ever conceived such a substitution possible. But the many who do not think, but only translate into action what appears to be the general trend of thought, are viewing the present state of flux with fortitude. The rush of appalling little manuals designed to enable anybody to teach the recondite mysteries of geometrical drawing in its early stages is hardly over; and numbers of teachers unable, through the faulty grading of their classes or their own limitations, to teach geometry as a science are preparing, with the aid of cheap rulers and compasses, to accomplish "constructions."

To those who have watched the crescent, triumphant, and waning popularity of the various aspects of school subjects during the past twenty years there is a touch of irony in the position of things. After a long struggle, the rigours of the South Kensington method of studying and copying form were removed, and replaced by the more intelligent system which we identify with the name of Ablett. It is one of Time's re-

venge that the implemental drawing of geometrical figures should take the place of a subject of intellectual discipline, and, apparently, be accepted as evidence of some kind of ability in the candidates for the Cambridge Previous Examination and the Oxford Responsions.

Indeed, it is suggested that it is in the interests of the large body of young men of no particular mathematical capacity who proceed to the Universities that much of the relaxation is due. For the few, comparatively, who have such capacity the interest of the study will in future apparently begin after matriculation.

The observer of twenty years, if also a practical teacher, may be pardoned for doubting if so drastic a revolution is really called for. There would be cause for much pessimistic depression—as invited by the recent researches of Dr. Karl Pearson—*anent* the mental power of the younger generation, if such doubt were not thriving and vigorous. Years of bad teaching on faulty methods by untrained and often ill-equipped teachers may have resulted in the crystallized conviction that only a boy here and there can learn geometry. For the rest boredom, want of comprehension, burdened memory, and stupefaction! Fortunately, no such idea is yet traditional about girls. Perhaps on account of the greater elasticity of administration in girls' schools, the system of divisions of classes for synthetic subjects, and a judicious application of the principle of parallelism in the building of the time-table, it is unusual to find the grading of classes such that no progress can be made with an exact science. Also, possibly through the idea—accepted almost to exaggeration amongst women teachers—that pupils are to be *taught* rather than to be *made to learn*, it is the exception to find any general incapacity for geometrical work amongst girls. Many of the recommendations of the Mathematical Association have undoubtedly been anticipated and practised by the mistresses responsible for the subject, all unconscious that they were thus performing the part of pioneers.

The grouping of subsidiary propositions of Euclid's text about certain main ones; the recognition of some truths as fundamental, whether appearing in the text or not, and of others as riders upon, or deductions from, them; the elucidation of theorems by means of others which are seen to lead directly up to them; the use of alternative modern proofs when greater neatness is thereby attained; and the study of Euclid, Book III., 1-32, before Book II. are amongst the established precepts of the practical teacher. Of mere surface matters—in which some of the most ardent reformers find an apparently novel delight, as of something strange and new—it has been the custom for years to exact reasonably accurate figures reasonably placed upon the page, neatness of statement and repression of wordiness, straightforward instead of circumlocutory description, and (finally) the use of heavier or coloured lines for exhibiting salient features of the diagrams. This last named device is at present in high favour; so potent is believed to be its employment that we almost hope to make up for lack of reasoning power by means of a box of coloured chalk. But the devices of the teacher, however successful when based upon real principles and dictated by knowledge of and sympathy with the difficulties of the learner, are useless when copied merely as details of method. There is some danger lest, in the wealth of published devices in the shape of little text-books, the wavering teacher should forget that the real aim of the study of geometry is the training of the reasoning faculty, in the multitude of constructions and measurements easy to make and more than easy to forget.

Those teachers who have been able to watch the developing mental power of the quite average pupil under the discipline of a studied and digested course of elementary geometry will reluctantly fall in with the demand for reducing the subject to its merely technical and calculating aspects. There is, however, still sufficient liberty left for those who desire it to maintain the intellectual side in teaching it. Even though the large majority of pupils subjected to the training never acquire anything like expertness in the solution of riders, the practice in attempting them, the habit of thought engendered in the methods of reasoning, and the occasional illumination of the whole mental outlook when some truth is even momentarily grasped are one and all too valuable to be exchanged for any mere draughtsman's skill.

The allied subjects, arithmetic and algebra, should be recognized in connexion with geometry, and especially in the truths whose common-sense side, so to speak, tends to become

obscured by the archaic Euclidean phraseology. But nothing is ultimately gained by removing every statement and conception from its "general" to a particular form. When every set of three equal numbers of inches has been utilized to make triangles, there is still *the equilateral triangle* to be thought about. Nor should all reductions of the abstract to the concrete be considered, or termed "verifications": they are usually only illustrations, and the mind that persistently "verifies" by means of the more obvious becomes more and more akin to that of our primitive ancestors. We read that, in early stages of social intercourse, the system of barter prevailing, when a bargain was driven that so many skins should be considered equivalent to two sheep, each set of skins and each couple of sheep had to be set out before the whole assembly. No trust could be placed in the general equivalence of seven skins for two sheep!

To return to the keynote of these articles. We have to decide what is the aim we set before us in teaching boys and girls such a subject as geometry. When Sir Isaac Newton went to Cambridge Euclid Books I. and II. formed the ordinary amount of geometry read. The "Preliminary" candidate of Oxford and Cambridge of to-day sniffs audibly at the tidings. "People are so much better educated nowadays" is his, and especially her, optimistic conviction. And, having caught the trick, hundreds of pupils yearly send up fairly written, correctly stated, proofs and constructions, as to which they, many of them, privately maintain a perfectly open mind. These tests, however, are but the field-days of intellectual athleticism. On such occasions the successful leapers who clear the bar are perhaps the fortunate few; but the real gain belongs to the past hours of steady practice and effort, when the false start was often made, the moment misjudged, the bar fouled—but the endeavour stirred the sluggish mind and braced the flaccid muscle, and in each individual did something to remove awkward incapacity. It will be much if, in "our complicated system" of secondary education, time and place can, in at least some schools, be reserved for studies and methods of study that enlarge and develop faculty and enrich the motive power of intellectual requirement. With the greatly increased opportunities, how much greater is the love of knowledge! With the many incentives to acquire it which proclaim its worthiness for its own sake, the fault certainly cannot rest with the children themselves, if, after their years at school, they are seen to enter upon life in the world destitute of resources, incapable of busying or amusing themselves, and craving always for something to be done for their entertainment. There is a sentence in the writings of Isaiah that suggests a condition of vague ill-being and misery—"Thou hast multiplied the nation and not increased the joy"—which seems sometimes oddly to express the disappointing results of a degraded ideal of education. The immense responsibility of every person interested in the true welfare of those that come after us, no less than of every thoughtful teacher, is the imparting to young minds the idea, and the awakening in them of some responsive conception, of the worthiness of life and the joy of generous endeavour.

S. C.

A DIFFICULTY CONNECTED WITH FREE BREAKFASTS.

MUCH is being written about the feeding of hungry children in the elementary schools, and wiser heads than mine are dealing with the social problem involved in the question. Among the many details discussed, however, I have nowhere seen mentioned a difficulty which nevertheless has to be faced by those who undertake to carry out the various remedial schemes suggested. This difficulty lies in the fact that, however benevolently the feast may be spread, it is not always easy to induce the children to partake of it. The reason of their unwillingness is not occult: it lies in no innate pride, in no deep-rooted hostility to the powers that be, but in the simple truth that on cold winter mornings our children prefer their bed to their breakfast. Breakfast is dispensed at 8.30; school does not open till 9; and the extra half-hour is a luxury which our imprudent little ones do not care to forgo.

Should any one doubt the truth of this statement, let him compare the elementary-school register in any of our city

slums with the weather report for the same place and time. He will find that, although wet weather does not in any degree affect the attendances, frost and snow will sensibly increase the number of absentees, and will almost double the number of late scholars.

I know a school—probably one of many—where free breakfasts were provided for one winter at least, but were necessarily given up at last, because the children could not be persuaded to come to them. Yet it is difficult to imagine a sadder spectacle than that of the little "sixes" filing into school on a cold winter morning. Here they come, trailing in one behind the other in a disconsolate line; some maintaining bravely the sturdy eagerness of tiny children, though their hands are blue and their faces drawn; others stiff and dazed, with stupid eyes and listless gestures. Some wee children are crying quietly; and, even when a good stamping march, with much vigorous hand-clapping, has combined with the cheerful warmth of the room to restore animation to the majority, there are always a few for whom no such efforts avail. The account these poor mites give of themselves is a pathetically reiterated, "I don't feel well." And, indeed, there is no wonder that they "don't feel well"! I myself have seen a girl in school wearing no other clothing than a cotton overall and an old chenille tea-table cloth pinned shawl-wise over her shoulders. Boots, of course, were there; whatever else may be lacking, in an English school boots are *de rigueur*, winter and summer; even when, as sometimes happens, the little six-year-old girl wears her father's number tens bent double over her foot, and bound round with string to make a fit.

These are the children who refuse to come out in the early morning to eat the hot breakfast which is freely offered them. At first sight it appears incredible; but, considered more closely, it is not so unnatural. We find it difficult enough to respond cordially to the offer of our hot water in the morning, and to rise in time to reach our cheery breakfast-table before the dishes have ceased to steam, even though we have gone to bed overnight fortified by a good supper, and have slept dreamlessly in a comfortable room. Consider, then, the contrasting circumstances of our slum children's sleep. Coming home hungry and very late, after having worked as char-girls half through the night, or danced in some low public-house till closing time, they huddle together for warmth under a curtain or skirt or threadbare blanket. Little by little the gradual thaw comes to the starved bodies; slowly, slowly, the ice-cold feet cease to ache; and only after hours of restless shivering does the sleep of childhood comfort them at last. Then the hour for rising comes so soon, so terribly soon! All is dark and chill and dreary in that wretched dwelling; may they not keep the sleepy eyes still shut, and forget it all in dreams? The hunger which torments them in the day-time is less insistent now; shall they revive those pangs by avoidable exertion? No one is at hand to recall the teaching, moral or hygienic, which may have impressed their minds in school, but of which, alas! they carry so little out with them into that categorically different life at home. No one is there to point out that the effort which they shrink from now must inevitably be made half-an-hour hence. The influence of the parents, if felt at all, is most often exerted in a contrary sense; the mother hears the call of no household duties; the idle father lounges through a day which is the better for being shortened. If they interfere at all, it is merely to grumble at the disturbance of their morning sleep.

"Hunger looks in at the working man's door, but dares not enter." The hungry children are the offspring of those whom misery tempts to self-indulgence and despair drives to thriftlessness. In moments of depression the whole state of affairs seems to be an endless circle. These poor creatures indulge themselves wickedly because there is no luxury in existence which is licit for people in their position; they waste their goods because they are despairingly certain that, however careful they may be, they will never have enough to live upon. In a higher rank of life I have seen a man give the last bank-note of his monthly income to a beggar in the street, for no better reason than that it was so hopelessly inadequate to pay his gambling debts; and that incident has come back to my mind when I have seen half-loaves of bread lying in the gutter while the children are dying for want of food.

Yes, they die. The lower standards are full of little wizened, half-human faces which are never seen in the first class. They die—and leave us wondering. Is that the best can befall them?

Is it possible that in forcing help upon them we are disturbing the deliberate process by which the survival of the fit is secured—hindering, as it were, the millenium? Experience teaches that, if they live, they, like their mothers, will contract hopeless marriages at the age of sixteen or seventeen, and the miserable history will repeat itself. What is to be said? Is our present system of education such that we may rely upon it to instil health into the minds of these poor victims of heredity and environment? Has it force to inculcate the virtues of self-discipline, self-dependence, and active resistance? Truly, the free breakfast problem raises far-reaching questions!

R. H. BRUCE.

THE INTELLECTUAL OPPORTUNITIES OF MANUAL INSTRUCTION.*

The Moving Finger writes, and, having writ,
Moves on;

while we, startled out of our after-dinner contentment by the *tekell* the hand of War has left upon our walls, soothe our consciences by scribbling the blessed words "efficiency" and "education" upon our still damp slates. But, although much of our self-accusation is evanescent, yet many important movements have received an impetus from the national heart-searching. The first war of the twentieth century has at least awakened us to realities; and, although we have been spared an 1870, we naturally wish to run no more risks; hence the cry for reform all round—departmental, sanitary (in its largest sense), educational. Yes, even education threatens to arise from the mud through which struggling factions have dragged it so long and to become a national concern, a "line of defence"; even a condition of successful competition—that most blessed word, dear to a progressive and commercial race.

But reforming zeal is apt to outrun enlightenment, and in certain directions it would seem that the desire to mend matters has grown faster than the knowledge required to do so successfully. I was to-day looking at a photograph of "The Russian Lion," a wrestler whose enormous muscular development amounts almost to deformity. No Greek sculptor would have taken him as a model: beside the Discobolos he would look positively ugly; yet he is undeniably strong and at the same time typically modern. Nowadays, apparently, strength is joined to ugliness rather than to beauty; yet we cannot but feel that the Greeks, whose sense of balance and proportion may possibly have prevented them from building up a great empire, should serve, in their many-sided perfection, as our educational model. We seem to-day to be tending towards an uneven, and in certain directions an excessive, development by a quack-like patching-up of the weaknesses visible in the body politic rather than towards a scientific strengthening of the constitution as a whole—we are inclined, in fact, to trust too much to specialization as a panacea.

In education this tendency is strongly marked, and it is now more necessary than ever to insist on the difference between development and cram and to keep in view the many-sided nature of the work; and, although many of those who ask the question "What is education?" do so in the spirit of Pilate, yet of some things we are still sure.

Education, like Gaul, is in three parts: the old tri-unity, the head, the heart, the hand—the mental, the moral, the manual—still holds its own as a basis for practical work. But, although we recognize this many-sidedness, we are unable—at least, in elementary schools and under present conditions—to give equal attention to every phase of the work.

To deal first with the physical side: we have the children under our control for about one-sixth of the whole week only. In twenty-seven hours we cannot do much beyond teaching class-room subjects; and frequently our schools are so built and situated that games and exercises are almost impossible. Further, the children's home surroundings are not favourable in many cases to sturdy development. If the children were in boarding schools in the country, we might have a different tale to tell, but, even as matters stand, the substitution of bench-work for desk-work must be for their physical good.

* An address by Frank J. Adkins to a branch of the National Association of Manual Training Teachers.

Then as to the moral side of our work. Roots grow unobserved beneath the soil and thrive best when left alone. In a school where honest, hard, happy work is being done the children's moral welfare is, I think, assured. The mental sphere thus remains, and this, it seems to me, is our true sphere. "I think; therefore I exist," said Descartes, and the great aim of education seems to me to be the development of thinking power. Now, in the class-room we are faced with this difficulty: we have to subdue the body and at the same time to stimulate the mind—a very exhausting and artificial state of affairs for all concerned.

The manual instructor is more fortunate. In his work the opposition between mind and body is replaced by co-operation. In the class-room we have to adopt the discipline of repression; in the work-room the discipline of free movement, of physical activity, is not only possible, but also necessary. Then, again, your classes are necessarily small in numbers, and you can rouse boys by means we do not possess. Take, for instance, the question of accuracy. When a careless boy has got used to blue crosses on his pages almost our only means of bringing home to him the seriousness of making mistakes is by an attack upon his epidermis; but in a wood-work lesson careless measuring and cutting result in a loose joint, and the boy realizes in his disappointment that accuracy is necessary to success.

Great opportunities, however, bring great responsibilities. How, then, can the manual instructor get real intellectual value out of his teaching? He does not want to turn out the mere mechanic; he feels that the technical view of his work is inadmissible, for, although he can, of course, have no objection to a boy making use of the skill and knowledge he acquires at the bench, yet he is obliged to recognize that this skill and knowledge are incidental, the accompaniments—secondary, even, though inevitable and essential—of intellectual processes, the means, not the end. If once they become the end, the rational or intellectual side of the work is apt to dwindle to nothing; whereas accuracy of manipulation is as necessary to the working out of thought in material as on paper—the wooden model has to be as correct as the paper sum.

No; the teacher has a fine field before him if he will but occupy it. Only it will be found almost impossible to make boys think and reason at the beginning of a lesson. They are so keen to be doing something with the material before them that to force them to think abstractly is to set up the very opposition between mind and body from which bench-work is so pleasantly free. When, however, the class has had its fill of sawing and planing, or modelling, or what not, it will be found possible to make it investigate the reasons underlying its various actions with more interest than is, as a rule, roused by abstract subjects. And here the best teacher is he who can, by the use of that truly educational word *why?* best dissect his subject up to its farthest point—till the question *Why?* remains unanswerable. The differences in the tools; the evolution of tools, with the changes in their shapes; the growth of timber, with the reasons for the use sometimes of one, sometimes of another, kind; the reasons for the variously shaped joints—all these can be made to yield food for thought if properly handled.

I have, however, found that an abstract subject may be even more stimulating than one which has to do with material. I had once to explain briefly the word "metaphysics," which occurred in a passage a class was reading; and I know that the fact that we cannot prove the objective existence of anything took a firm hold over some of the pupils, as their subsequent actions in the playground showed. Again, I believe an older pupil gained a more real knowledge of scientific method from a study of Seeley's "Political Science" than from much of the laboratory work he had done. Facts—especially those which are demonstrated by the manipulation of matter—are so insistent, and the experiments connected with them are so interesting, that they are apt to obscure the rational basis of which they are only the manifestations, as clouds obscure the sun which causes them. Children, in fact, find it hard to generalize at any time, most especially when they are engrossed in an experiment or an operation. The tracing out, however, of cause and effect in one continuous chain, or the reversal of this process—the analysis by means of *Why?*—are the most thoroughly educational exercises in which we can engage.

Thus, those subjects in which the question *Why?* brings out the clearest answers are, from this point of view, the most valuable educationally; and hence mathematics and geometry—being deductive and consequently presenting undisturbed chains of reasoning—are excellent intellectual gymnastics. Their serenity can counterbalance the excitement produced by contact with material, and material may be used to illustrate an otherwise entirely abstract subject. Thus, a boy might be told to make a box just large enough to hold a hundred and fifty marbles, each of an inch diameter, and left to his own devices.

Of course the weakness of mathematical subjects from an educational point of view is the small amount of practice they afford to the judgment and to the selective faculties; but these can, I think, be well developed in a wood-work lesson by presenting a problem to a boy and leaving him to work it out in his own way as I have already indicated. From time to time, also, a good boy might be allowed a free lesson in which to make what he liked, provided he drew it out first. This would wean him from the excessive dependence on his teacher which is a source of real weakness in much of our school work. We must make our boys more resourceful and self-reliant, less likely to be flustered by the presence and criticism of strangers, more self-possessed and alert when confronted with practical difficulties; and the workshop, with its small classes, many-sided and individualized activity, and opportunities for personal intercourse between teacher and taught, is a far more satisfactory training ground for these qualities than the class-room. Again, individuality and taste could be given a certain scope in the ornamentation of models already made. Thus, a blacklead scroll on a box lid would individualize one boy's work from another; and, if a little wood-carving could be added to the joinery, greater variety and interest in the work would result.

Of course manual instruction is not confined to wood-work; though the latter has the greatest intellectual value. A freer and more artistic course can be founded on clay modelling, while cardboard is a medium not to be despised. We want pupils to be able to express themselves, and to do so through as many *media* as possible—through speech, through writing, through drawing, and through handling material. Only thus can latent individuality be drawn out; by this means chiefly is the character formed, its strong and its weak points displayed and rendered accessible to the teacher. So are we all engaged in the same work, but along different paths; and the path of manual instruction is one of the pleasantest the children have to travel. Its value has become axiomatic in the infant schools; let us hope it may be increasingly recognized in those for older scholars.

REVIEWS AND MINOR NOTICES.

Arachnia: Occasional Verses. By JAMES ROBERTSON.
(Macmillan.)

The volume consists of two parts—original verse and translations; and we feel some hesitation in reviewing it, since, in our opinion, which may be biassed, the better part is the translations, and the best of the translations have appeared among our Prize Competitions. But, apart from the literary merit, which is not small, the book has a psychological interest as revealing something of the character of a remarkable man, who deliberately chose the "*fallentis semita vitæ*" and turned to the world his rougher side, the satyric mask of a Socrates. The reader who knew not Robertson in the flesh, or only knew him officially as a head master, should look well at the portrait by Charles Furze which is reproduced as a frontispiece—a portrait that has wonderfully limned the soul behind the mask. In many of the poems, it must be confessed, the interest is mainly biographical. The poem strikes the keynote—the self-depreciation of one who (to travesty Aristotle) thinks himself not worthy of great things, being worthy:

'Tis but a musty note-book,
With scanty scraps of rhyme,
Of one who never wrote book
Nor meant to, all the time.
Will cobwebs from the Corner
Long left in silence dumb
Find any keen Jack Horner,
Or he find any plum?

Then we have lines, Latin and English, on the skeleton of a hanged pedlar that Robertson was set by the Master of his College to mend. That Master must have had a sense of humour. The lament of a bachelor Fellow is almost Swiftian :

Yet a tup put to graze by himself for the rot
May be pardoned for saying he's lonely.

Then comes a ballad with a haunting refrain :

Loup, loup the puddock,
And aye the skreigh-owl skirl,
And the dark dank rock still throb at the shock
Of the water's angry swirl !

Lines "In the Dissecting Room at Edinburgh" are as weird and gruesome as anything in Monk Lewis or Edgar Poe or Hauff. Two sets of verses addressed to the late Dr. Temple are not in themselves remarkable, but are a telling testimony to the admiration, this side of idolatry, in which Temple was held by his colleagues. Two "fair copies" for pupils are admirable as fair copies (especially the self-criticisms of the former), but, except as models for composition masters, are hardly worth preserving. The inscription above the Bradbeian is too well known to quote, but the longer Latin inscription placed round the main buildings will be new to many :

Grata faventibus	alma colentibus	haec pia sedes
Non sine nomine	gaudeat onine	Palladis aedes
Digna prioribus	exstet honoribus	incluta plenis
Conscia numinis	hospita luminis	apta Camoenis.

"In the course of a Walk near Rugby" and "The Doleful Tragedy of Seven Dials" are direct, unvarnished transcripts of common life after the fashion of "The Village": but there is in them a feeling of humanity deeper than anything in Crabbe. The sonnet is a kind of verse that suited to perfection Robertson's inborn sense of the power of words and his scholarly striving after perfection of form. We have here some six—"alas! too few"—each exquisite in its degree.

Of the translations, besides the Simonides, the Béranger, the Heine, and the Victor Hugo's—which refute the vulgar generalization that all prize compositions are second-rate—we have a spirited translation in blank verse of the Nisus and Euryalus episode and the best we know of the innumerable versions of Goethe's "Hedge-rose" and his "King in Thule." If the *Volklieder* are less successful, it is because the task is impossible.

Through all the bright long day
Pain wears my heart away

—we know not how it could be improved, but it sounds to us like

Den lieben langen Tag
Hab i nur Schmerz und Plag

heard through a gramophone.

We hope that the editor will fulfil his half promise of a second volume with the translation of the first book of Lucan which so impressed Dr. H. M. Butler, and add thereto specimens of his father's brilliant versions in Latin verse.

The Queen's Quair. By MAURICE HEWLETT. (Price 6s. Macmillan.)

In "The Queen's Quair," Mr. Maurice Hewlett has set his hand to fill another historical canvas, and his task is the greater in that he is here dealing with a time and person which have been the theme of art for generations, and in which any departure from accepted traditions is a direct challenge to criticism. Here we have no romance set in some forest of faery, or at least beyond the pale of human happenings, nor the picture of a period so remote and so scantily documented that the novelist may weave fancy with fact in his search after causes without running the gauntlet of the historian. Few epochs of modern history have been so thoroughly explored as this age of glory for England and tragic upheaval for Scotland—the age of Elizabeth and Mary Queen of Scots.

Mr. Hewlett claims to have done a new thing : to have penetrated for the first time to the heart of the Queen whose misfortunes and great gifts have kindled the chivalrous fervour of so many among men and women : he claims to hold the key of her heart, and to have unlocked it. Before, we have seen her as the "woman ensky'd and sainted," the sued, not the suer ; the victim, not the despot : he will lay bare her heart and disclose the secret of her strength and weakness while she

might yet, though already with bitter irony, call herself free. He disclaims for his book the title of romance. Truth is to be his aim and the sole determiner of his treatment. There can be no question as to the enthusiasm and imaginative historical sense with which Mr. Hewlett entered on his task, and it is doubtful whether any more brilliant study has ever been made of the complex web of interests, hatreds, and misrule which Scotland presented to Mary for her trial-ground in governance. Mr. Hewlett's treatment of his material—in particular his imaginary framing of certain scenes in the journal of subsidiary characters—is a triumph of dramatic craftsmanship. The portraiture is throughout masterly, and many individual scenes eat into the memory by their intensely vivid realization. Notable among them is the grand trial of the Gordons before Mary, and the scene between Mary and Bothwell in the cold mists on the moor, when he first became conscious of the depth of the Queen's hatred for Darnley. The dramatic interest and the dialogue are sustained with admirable skill, and the handling of so motley a retinue of characters and incidents is beyond praise. Yet we are forced to suspect that it is less for these rare and permanently admirable artistic qualities that Mr. Hewlett has grown thus early into fame than because he appeals with a subtlety that eludes antagonism to the sensual in human nature, surrounding the unpurified aspects of passion with a glamour which makes it attract those whom it would in nakedness revolt. It is indeed questionable whether the aspect of Mary's character which Mr. Hewlett claims as his discovery was matter for art at all, and more particularly for the universally popular artistic form in which he has elected to embody it. Whether Mr. Hewlett is conscious of it or not, there is no doubt that a large section of the public will not be slow to discover that his book is the record of a disastrous, unreasoned sexual passion, and will eagerly welcome this pitiful tale of protracted degradation in the guise of a historic romance. There is no reason to doubt that this portraiture of Mary in "The Queen's Quair" is in part a portrait of the Mary of history, and it is well that the students of her tragic and mysterious experience should hold the key to it which Mr. Hewlett provides : but let not this record of an ignoble passion be blazoned in the forefront of a romantic history and become its pivot and inspiration. Mr. Hewlett has elaborated this single aspect of Mary as "huntress" to the exclusion of every other, and presents her in the light of her lusts with a concentration of interest which revolts and does not altogether convince us. We dare not indeed say, in the face of obvious facts, that Mary's self-immolation before Bothwell was impossible from his monstrous unworthiness, but we do demand that her passions be set in due perspective to her intellectual powers. Mr. Hewlett cannot easily be acquitted of the charge of pruriency, not only in his treatment of Mary, but in his general portraiture. Coarseness would be far less reprehensible, because far less attractive, than the subtle physical over-emphasis which stamps the whole book and infects his very imagery. The occasional brutality of his treatment might be justified by its fidelity to historic conditions : it is not this which we condemn, but his elusively sensual descriptions and allusions, and his constant characterization of emotions in a purely physical relation.

Critical and Historical Essays. By Lord MACAULAY. Edited, with Introduction, Notes, and Index, by F. C. MONTAGUE, M.A. (3 vols., 7½ × 5 in. Vol. I., pp. xlviii, 584 ; Vol. II., pp. 510 ; Vol. III., pp. 516. Price 18s. Methuen.)

This is a good edition—far the best complete edition, with notes, with which we are acquainted. It is true that neither the type nor the paper is entirely to our liking ; but, then, the price is very moderate and the binding is simple and tasteful. Moreover, the editor has done his work extremely well. Mr. Montague is Astor Professor of History in University College, London, and it is precisely a sound and wide knowledge of history that an editor of Macaulay's "Essays" needs most of all. Prof. Montague quite evidently possesses such a knowledge. He possesses also two other necessary qualifications, in importance almost equal to the first—a sound taste and judgment in literary matters and a very full acquaintance with what has been said and written about the "Essays" themselves. Each essay is preceded by a note—varying in length according to particular requirements—dealing with the essay in question and supplying an epitome of the chief criticisms which have

been applied to it, together with references to further sources of information. These prefatory notes are written with great care and good judgment, and set forth clearly and concisely the editor's own view and the views of other critics of good standing. The other notes are given at the foot of the page. They are moderate in number, brief, and very efficiently perform their office of explanation and reference. They steer an excellent course between the dangers of too much and too little, and will, we believe, be found very much to their purpose, both by general readers and by professed students. Macaulay's great fondness for allusions and the frequent verbal inaccuracy of his quotations must always render the task of editing what he has written a very difficult one. As often as not an allusion is purely decorative, and one may waste much time in searching for, and much space in recording, its source. As to how much time Prof. Montague has spent in such vain hunts we can only guess, though, judging from personal experience, we imagine that it may have been considerable; but we have not noticed any instance of his recording a reference which may justly be considered futile, while, with regard to correcting faulty quotations, we have noticed only two instances in which an error has remained unnoted—both in the "Essay on Milton": page 15, "but o'er their heads" should be "but nigh at hand," and on page 58, besides the error pointed out, there is another in the second line of the quotation, where "the" should be "his."

The general introduction is a good piece of work. It gives all that is of any importance in Macaulay's life, and sets forth with great moderation and good judgment his characteristic strength and weakness as a writer and thinker; and specially good is what is said as to the various views which at different times have prevailed as to what should be the office and contents of history. Perhaps we ourselves would make a more marked distinction between a writer who would never willingly set down anything he knew or suspected to be untrue, and one who would never spare himself any pains to ensure that everything he sets down is as accurate as possible, and that he omits nothing of importance. Macaulay was a truth-lover in the former sense, but not in the latter. It is very difficult to excuse much of what he wrote in his "Essay on Clive"—and Mr. G. W. Forrest has revealed quite lately in *Blackwood* still further errors as regards the siege of Calcutta and the Black Hole—while in the case of the "Essay on Warren Hastings" complete excuse is quite impossible; and there are other cases which might be mentioned. It is only too evident that Macaulay at times was quite willing to accept as authorities those who had no right to be so considered, even when the means of testing their accuracy lay ready to hand, and when the consequences of accepting their statements were by no means trivial. We do not mean to imply that Prof. Montague ignores this matter, but only that he seems to us to glide past it too easily. There is also the question of Macaulay's unacknowledged borrowings—from Orme, for instance, in the Clive essay. But, when all is said and done, Macaulay's "Essays" have now been definitely accepted as classics; and Prof. Montague has given us a useful and scholarly edition of them, and has prefixed thereto an admirable introduction.

Greek and its Humanistic Alternatives in the Little-Go.
By KARL BREUL. (Simpkin, Marshall.)

An opportune pamphlet on the question of the hour by a professor of modern languages, and confessedly an *ex parte* statement, but broad-minded and singularly free from personalities and special pleading. The first part of the pamphlet gives in full the speech that Dr. Breul had intended to deliver in the Senate House, then curtailed for lack of time. The second part contains *pièces justificatives* of certain statements in the speech. The third consists of brief comments on the debate published in the *University Reporter*, giving chapter and verse. Even a full-dress debate of this importance soon drops out of memory, and we are afraid that few even of those most interested will have preserved a copy of the *Reporter* for reference. The portion of the pamphlet that is of permanent value is the bibliography, a reasoned catalogue of official documents and the leading authorities in France and Germany bearing on the question. There were many appeals in the course of the debate to German schools and Universities and to German *Gelehrte*, but these revealed a singular ignorance of existing conditions. We are indebted to Dr. Breul for giving us the facts.

In Prussia there are three kinds of higher-grade secondary schools with a full nine years' course:—*Gymnasien*, Greek, Latin, and French compulsory; *Realgymnasien*, Latin, French, and English compulsory; *Oberrealschulen*, French and English compulsory. Pupils coming from any one of these three types of schools are admitted to the University on the strength of their leaving certificate. Only for students in Divinity and Classics are Latin and Greek both required. Medical students entering from the *Oberrealschulen* have to pass a supplementary test in Latin. Law students are cautioned that in their final examination they may be required to show acquaintance with some Latin text.

To sum up, the only professions for which Greek is a necessary preliminary in Prussia are the Church and State librarians. And yet one speaker unblushingly asserted in the Senate House (and he was not contradicted) that "the Berlin University had, after ten years' experience of non-Greek students, asked the Government to exclude them." We wish we had space to quote in full the answer of a Berlin professor to Dr. Breul's inquiry whether there was any foundation for Mr. Dunn's statement. One sentence must suffice: "There are, it is true, here and elsewhere, old-fashioned dons who think there can be no salvation outside the *Gymnasium*, but they are a feeble folk. 'Die moderne Strömung ist zu stark.' There is no fear that in consequence there will be any falling off in the study of Greek."

On "soft options," the study of Greek literature on modern sides, the scope of the Medieval and Modern Languages Tripos, we must refer our readers to the pamphlet. No German, to our knowledge, except Max Müller, has shown such mastery of English prose as Dr. Breul.

Harvard Lectures on Greek Subjects. By S. H. BUTCHER.
(Macmillan.)

These lectures, delivered at Harvard University in the spring of last year, are intended as a companion volume—we should rather call it a sequel—to "Some Aspects of the Greek Genius," a book that we have more than once commended as the best introduction that we know to the study of Greek thought, a rare combination of exact scholarship and popular exposition. In the matter of ease and fluency, a perfectly clear and limpid style, the logical marshalling of facts and the power of deducing broad generalizations from them, there is no falling off in the sequel. The titles of the lectures will sufficiently indicate the scope of the volume: (1) "Greece and Israel," (2) "Greece and Phoenicia," (3) "The Greek Love of Knowledge," (4) "Art and Inspiration in Greek Poetry," (5 and 6) "Greek Literary Criticism." The first lecture traverses familiar ground: the contrast is admirably brought out by two concrete examples in Matthew Arnold's "Essays in Criticism." Mr. Butcher's comparison of the "Prometheus" with the Book of Job is hardly less striking. Our only criticism is that the savage and naturalistic elements in Greek religion are not sufficiently recognized. The question is suggested, but not answered—How far would Aeschylus have accepted the *Entwickelung* of Shelley's "Prometheus Unbound"? The second lecture is an enlargement of the striking address to the Teachers' Guild which appeared in these columns. We do not know what Mr. Butcher's politics may be, but one point is incidentally brought out which has a present application. The Phoenicians were the protectionists and the Greeks the free traders of the ancient world, and this not only in commerce, but in art. "This free trade had in it an educative and expansive force; it gave unity no less than variety to artistic culture; it quickened the sense of Hellenic patriotism." The third and fourth lectures are stimulative and suggestive; they will be read by many to whom Aristotle's "Poetics," even in the author's translation, is a sealed book. The last two, learned as they are, seem to lack the last touches of the artist. The mass of matter furnished by Prof. Saintsbury's great work has not been fully digested.

Mr. Butcher wisely steers clear of the eternal Greek question, and we will follow his good example; yet, as he now and again glances at those who "made the great refusal," so we too may be allowed to shoot one Parthian arrow, not barbed or poisoned. The analysis of the Book of Job is no less profound and luminous than that of the "Prometheus," and there is no more eloquent passage in the lectures than the appreciation of Hebrew poetry on pages 14, 15. Does Mr. Butcher know as much Hebrew as did Heine?

"Temple Primers."—*Roman Literature*. By HERMANN JOACHIM.
(Price 1s. net. Dent.)

He is a bold man who would follow Mr. Mackail in a brief history of English literature, but, though the titles are almost identical, the two authors move in a different plane and hardly enter into competition. Mr. Mackail's "History" reminds us of Ruskin's "Notes on Academy Pictures"—appreciations by a past master in criticism expressing his personal likes and dislikes. Herr Joachim's suggests a second-hand bookseller's descriptive catalogue, where against each book is put a justification of the price. Such a work has its proper function, and we willingly testify to the general soundness of the author's estimates; but it is the work of a valuer, not a connoisseur. There is not, as far as we have observed, a single extract or quotation in the volume—no nuggets of gold to tempt the young student to explore for himself the rich mine. Further, the estimate of Latin poetry strikes us as singularly unsympathetic. What shall we think of a critic who ranks Horace's "Satires" as his best work, who dismisses his lyric poetry as "frigid, academic, and often false in sentiment," and of the Fourth Book of the "Odes" has nothing better to say than that "apart from some playful erotic matter we find hardly anything but poems on statesmen and members of the highest court society, the tone of which often seems stiff and forced"? Again, we are no more admirers of Ovid's "Ars Amoris" than is Herr Joachim, but to say "it is immoral and bawdy in every line—a book only fit for harlots" is a grotesque exaggeration, more absurd than would be the same charge brought against the "Venus and Adonis." Save in one passing reference to a play of Shakespeare, the influence of Latin on English literature is not touched upon. On the other hand, as is natural, it appears to Herr Joachim the chief merit of Propertius to have inspired Goethe's "Roman Elegies," of Phaedrus to have served as a model for Lessing's "Fables," and of Martial to have suggested the "Xenien."

Latin Exercises. By A. E. THORNE and Rev. H. GORSE. (Allman.)

Simple sentences, following the order of the "Latin Primer." They are framed by men who have had experience in teaching, and for those who stick to the old method are as good as any we know. There is a full vocabulary at the end. In the next edition the sentence "Having heard the witnesses, it could not be denied that the man was guilty" should disappear.

Ludus Latinus: a Book of Latin Exercises for the use of the Fourth Form. By A. B. RAMSAY. (Price 3s. 6d. net. Spottiswoode.)

This, like the above noticed Exercises, begins on the lines of the "Latin Primer"; but after the first forty exercises no references are given to the "Primer," and we advance to easy continuous prose. The "cooked" passages, adapted from ancient and modern authors, have the great merit of being interesting. Thus "The Pied Piper" is put into requisition. The price strikes us as rather high; otherwise the book should command a sale beyond Eton.

The Homeric Hymns. By T. W. ALLEN and E. E. SIKES.
(Price 10s. 6d. net. Macmillan.)

"The Homeric Hymns" are edited with preface, *apparatus criticus*, notes, and appendices. Particularly useful to the student will be the bibliography prefixed to each of the longer hymns; for here there is no question of transcribing catalogues, but experts recommend to their readers what they have themselves found useful. As to the book in general, the editors have achieved a rare degree of completeness in the matter that they have collected. Although their work bears more signs of labour than of inspiration, their text, at least, will long be accepted in England as authoritative, if some of its readings, e.g., that of ii. 398, can hardly claim finality. It is a book to buy for the school library or for the study.

The Tragedies of Seneca. Rendered into English Verse by ELLA ISABEL HARRIS, Ph.D. Yale. (Frowde.)

"The old translations of 1581 and 1702 have been long out of print." Such is Miss Harris's reason for retranslating the ten dramas contained in this volume—all of them, except the last, "Octavia," bearing in their names the fact that they are reproductions of the Greek dramas. We all know where to look for the prototypes of Latin dramas called "Mad Hercules," "Medea," "Phaedra": "Oedipus," and "Agamemnon," and "Hercules on Oeta," must shine with a borrowed light, if they shine at all: Seneca was not the man to mould a new type of classical drama. Yet there is no doubt that, in days when a knowledge of Latin was widely spread, and a knowledge of Greek somewhat rare, Seneca's dramas built a kind of bridge between the old and the new. Miss Harris apologizes modestly (Preface, page viii) for putting Seneca's choruses into blank verse, as she does the dialogue, on the ground that the "lyric form" was beyond the translator's poetic power. We must, of course, accept her decision as final—but we regret it, all the same. She writes blank verse with a good deal of force and variety; and that is a harder task than the easier sorts of riming verse. Not that rime is essential—but it is essential that the choruses should not look and read like the dialogue. The vigour and spirit, e.g., exhibited (page 353) in the rendering of Thyestes' final curse—

"Hear, O ye seas, stayed by inconstant shores;
Ye too, ye gods, wherever ye have fled,
Hear what a deed is done! Hear, gods of Hell,
Hear, Earth, and heavy Tartarean night
Dark with thick cloud! O listen to my cry!
Thine am I, Hell, thou only seest my woe,
Thou also hast no star—

could hardly fail the writer (if she had reasonable trust in her own gifts) in writing a choric measure, rimed or unrimed.

McDougall's Rational School Method. A Handbook for Teachers.
By AN INSPECTOR OF SCHOOLS. (Price 2s. 6d. McDougall's Educational Company.)

In this "School Method" are chapters on "The Teacher's Aims," "Organization," "The Infant School or Class," "Aids to Teaching," "Reading and Recitation," "Writing and Composition," "Arithmetic," "Object Lessons," "Elementary Science," "Geography," "History," "Drawing," "Singing," "Drill." All these subjects are dealt with in a single volume of 143 pages. It has the merit of introducing the reader to such names as Herbert Spencer, Dr. Dukes, Dr. Sully, Mr. Courthope Bowen, Mr. P. A. Barnett, Sir John Gorst, Miss Phillips, Miss Dodd, Mr. Morison, Sir Joshua Fitch, Prof. J. R. Seeley, and a fair number of names of H.M. Inspectors, with quotations from their reports. It also brings before the attention of the reader McDougall's Educational Company's three-term registers, and the same Company's "Concentric Series of Historical Readers." There is a good list of educational reference books. It is claimed for the book that its plan is practical, suggestive, rational. But with so many subjects to deal with, so few pages in which to deal with them, and with so many people's opinions cited, the book necessarily gives the impression of being scrappy, though there are certainly many useful hints.

Common Thoughts on Serious Subjects. By CHESTER MACNAGHTEN,
Principal of the Rajkumar College, India. (The Unit Library.)

The writer of these short addresses to boys was a remarkable man, one of the many remarkable Englishmen who go out to the four quarters of the earth and serve their country faithfully and to good purpose, but of whom the world knows little. Mr. Macnaghten was in 1870 appointed Head of the Rajkumar College in Kathiawar, where the sons of native princes and chiefs were to be educated on English public-school principles. His was a difficult position, for he was working among the most conservative of peoples, and in religion and in ideals he was an alien. He remained at his post for over a quarter of a century, and won the respect and admiration of all his pupils, many of whom are showing by their lives the influence of this admirable teacher. The addresses printed in this volume were well worth preserving, and might be read with advantage by teachers in our English schools. They are religious in the widest sense of the word, but because they were given to non-Christian pupils they are entirely unsectarian. They deal with a wide range of subjects—Truth, Courage, Duty, the Presence of God, Home, Zeal, Health, Personal Influence—and are marked by great simplicity and often beauty of style, keen insight into boy nature, and an outspoken fearlessness which commands admiration. It is probable that English schoolboys would derive considerable benefit from perusing them, and we see no reason why this volume should not find a place in all school libraries. The market is not over-stocked with books of this nature, and room should be found for a volume so suggestive and stimulating as this.

The Point of Contact in Teaching. By PATTERSON DUROIS. (6 x 4 in., pp. xv., 131; price 2s. 6d. Sunday School Union.)

Though published in its first form eight years ago in the States, this little book is in its first English edition—the fourth since it actually appeared. It attends strictly to one point of teaching, and that not a very novel one, viz., that in the teaching of very young children we should choose those points in the general range of characteristic childhood experiences—and especially those which arise from the child's immediate contact with the external world. But, though not new, it is well written, and abounds with good examples both for and against its plea; and its practice tells dead against that usually adopted in foolish Sunday schools. It should do much good. It is a bright little book.

The British Journal of Psychology. Edited by JAMES WARD and W. H. R. RIVERS. Volume I., Part 2. (10 x 7 in.; price 3s. 6d. net. Cambridge University Press.)

There are four papers by Charles S. Myers, W. H. Winch, R. Latta, and W. McDougall, and the proceedings of the Psychological Society. This is the second part of a "semi-occasional" publication which will be issued at irregular intervals, and will form volumes of about 450 pages each. It makes an excellent start, and should do well.

Poems by Richard Crashaw. Edited by A. R. WALLER. (Cambridge University Press.)

All scholars and lovers of literature will be grateful to the publishers and editor who have presented in one volume for the first time the whole of Crashaw's poems, English and Latin; the latter, indeed,

have been hitherto practically inaccessible except to those who were willing to burrow in various libraries, though a certain number of these were published by Dr. Grosart in 1872-3. Crashaw, like his contemporaries Herrick, Vaughan, and Habington, has never appealed, and is never likely to appeal, to a very large audience; yet he has never lacked a select, if small, number of admirers who deeply appreciate his intense religious feeling, his beautiful lyrical gift, and his command of the Latin language. Critics have objected to his fantastical language and images, to his conceits and quaint turns, which often give an artificial tone to some of his serious poems; but this is an objection that may be brought against nearly all of the Caroline poets, and is not confined to Crashaw. At his worst, it is true, Crashaw falls very low, but at his best he deserves a very high place; his "Wishes to his Mistress" contain some unforgettable lines, while "The Flaming Heart" show how curiously emotional, even passionate, is his religious feeling, and how beautiful is his choice of language. The "Epigrammatica Sacra" deserve to be better known by those interested in devotional literature. The conceits so dear to him find a fitting vehicle in Latin epigrams which often recall the delicate touch of Martial; at the same time a modern reader will find in them, as a natural result of their subject, a restrained passion by which Martial was seldom inspired. Crashaw rarely descends from the quaint to the grotesque; the majority of the epigrams do not sacrifice religious feeling to extravagance of expression, and are worthy to rank with George Herbert's quaint, tender lines. What could be more beautiful than

"Esse levis quicunque voles, onus accipe Christi:

Ala tuis humeris, non onus, illud erit,"

or more deep in thought than the reference to the love of the Father for the Son in

"Quippe, tuos spectans oculos, se spectat in illis;
Inque tuo (Jesu) se fovet ipse sinu"?

"English Men of Letters."—*Maria Edgeworth*. By the Hon. EMILY LAWLESS. (Price 2s. Macmillan.)

Miss Emily Lawless has written a delightful and readable book on Maria Edgeworth; yet it cannot be considered an entirely successful biography, for the subject of the biography is so constantly forgotten, and figures that should occupy a minor position impress themselves too strongly on the reader's mind. We get a vivid picture of that extraordinary creature her father, Richard Lovell Edgeworth, and his patriarchal establishment at Edgeworthstown, where for so many years Maria, his eldest daughter, acted as agent, secretary, teacher, and where she gained such an intimate knowledge of Irish character. But of Maria herself we feel we know little; it may be that material does not exist, or it may be that that in truth there is very little to know of her. Her life would appear to have flowed on pleasantly and placidly, filled with domestic duties of all kinds which the large family raised up by her father would necessitate in an elder daughter. Here is no "Sturm und Drang" period; no emotional passages, no sealed book; the nearest approach to sentiment is when a certain M. Edelcrantz, described by the object of his affections as "a Swedish gentleman of a superior understanding and mild manners," offers her his hand and heart, which are, however, rejected. Her father's influence on her was extraordinary; it lasted till his death in 1817, and, with the exception of "Castle Rackrent," which Miss Lawless regards as her finest work, all her stories and novels bear evidence of it. It is probable that this influence was disastrous from the point of view of art; Mr. Edgeworth belonged to the utilitarian school of educators, of which the author of "Sandford and Merton" was such a brilliant disciple, and so impressed these views on his daughter that she was unable to escape from pointing a moral and preaching the principles of utility in season and out of season. Miss Lawless devotes some interesting pages to the friendship between Scott and Maria Edgeworth, shows how greatly the latter affected the former, and recounts with much charm the visit of the three Edgeworth sisters to Edinburgh in 1823, and the delightful reception accorded them by Scott and his circle. The criticism on the various books is not of a particularly illuminating character, but what Miss Lawless seems to lack in critical ability she makes up for in her understanding of Irish life and character, and her capacity to make us see and know Ireland in the days when "Castle Rackrent," "Ennui," and "The Absentee" were written. And that, perhaps, will arouse in her readers a stronger desire to renew their acquaintance with Miss Edgeworth than pages of critical analysis.

Readings in European History. By JAMES HARVEY ROBINSON, Professor of History in Columbia University. Vol. I. *From the Breaking up of the Roman Empire to the Protestant Revolt*. (Ginn.)

The purpose of this book is to teach young students of history the nature of primary authorities by extracts from contemporary writers of various periods and countries, translated into English. These extracts are grouped together in separate chapters according to their subjects or periods, and at the end of each chapter there is a short bibliography divided into (1) books suitable for school libraries, (2) English books of a more advanced kind, and (3) books, whether in English or other languages, which will help a student who undertakes thorough and independent study. It is impossible to believe that any

one who wants the books described in classes (2) and (3) will go to a work of this sort to find out about them. No one, surely, who is capable of using Jaffé's "Regesta," for example, will have recourse to a school book for information either as to its form or its contents. As regards the books noted in the first class, the entries seem few, so far as English publications are concerned. The extracts range from Seneca to Vasari. A choice of flowers from so wide a field must to a great extent be arbitrary. On the whole, there is little room for adverse criticism as regards the compiler's selection. Too much, however, is attempted; a more thorough illustration of the historical literature of a shorter period would have been advisable. Many of the pieces lose by translation, and the book as a whole lacks the brightness which it would have gained had each piece been given in the writer's own words, instead of all alike in the same modern dress. To some extent Prof. Robinson's work fails of its purpose, for as it contains only three or four documents, it is likely to lead the reader to believe that the firmest grounds on which history can be based are to be found in contemporary narratives. Valuable, and indeed necessary, as these are, the reader of a chronicle is at the mercy of the writer, possibly a careless narrator, often a prejudiced one. Dry and colourless documents, such as grants, legal records, money accounts, whether public or private, and the like, have no such drawbacks.

The Journal of Theological Studies, October, 1904. (Price 3s. 6d. net; 12s. yearly. Macmillan.)

The present number of this great theological quarterly—the solitary representative among magazines published in this country of scientific theology, pure and simple—fully maintains its high standard of scholarship. The current issue forms the beginning of the sixth volume. The first contribution in it consists of an appreciation of the late Prof. R. C. Moberly by his son, which takes the form of an answer to a *Church Quarterly Review* article. It gives an authoritative and intimate exposition of some of Moberly's characteristic points of view, and serves to explain, and perhaps justify, much of Moberly's work that otherwise might secure scant justice from critical theologians. This is followed by a very important essay from the pen of Prof. A. A. Revan on "The Beliefs of Early Mohammedans respecting a Future Existence." The writer shows that the pre-Islamic religion of pagan Arabia did not include any belief in a Paradise or a Hell. "The ancient Arabian poets are never weary of repeating that after death man has nothing more to hope or to fear." The Prophet's teaching regarding the future life, "far from supplying an easy explanation of his success, is proved to have been a great stumbling-block to his contemporaries, and was never fully accepted by his followers in subsequent ages." The differences between the teaching of the Quran itself and later Mohammedan theology are cogently set forth and explained. That the Prophet borrowed his ideas on the subject from non-official and unorthodox Christian sources is shown to be highly probable. The following articles deal with "The Inspiration of the Liturgy" (F. Granger) and "The Book of the Dead" (G. St. Clair). The latter elaborates the contention "that the basis of ancient Egyptian theology was largely astronomical." The other two principal parts of the magazine consist of "Notes and Studies" and reviews. Specially interesting are the notes on "Proems of Liturgical Lectures and Gospels" (P. H. Droosten), "The Etymology of Bartholomew" (N. Herz), "Pontius Pilate in the Creed" (T. H. Bindley), "Baptism by Affusion in the Early Church" (C. F. Rogers). The *Journal* is quite indispensable to all serious theological students, and deserves a far more generous support than it receives.

First Stage Steam. By J. W. HAYWARD, M.Sc. (University Tutorial Press.)

This is a handbook specially written to meet the requirements of the Board of Education examination, and contains the papers set in the years 1901-4. As its name implies, it is, of course, a book of an elementary character, and it is one of the "Organized Science Series." There is no doubt a necessity for books of this kind, but for ourselves we do not care to see it written so much in the form of a cram-book. The author takes a subject and says just enough to make the learner see its importance and then fails to satisfy his curiosity by passing on to something entirely different. The whole style of the book is of the form one would expect to see in the papers of a good examination candidate who is writing against time. Moreover, the diagrams seem somewhat rough, and the lines are too thick. In our opinion the author could well have given more space to the modern stationary engine and to the theory of multiple expansion, and scarcely sufficient is said of the turbine to make the information of any value to the reader. The mathematical, rather than the descriptive, side of engineering is prominent in the book, and in this respect, bearing in mind his object, we think the author is right. Though the book has faults, we think it may be recommended to candidates who have the Board of Education's examination to pass, but we do think that books of this kind give the student a superficial smattering which a more elaborate book would not have done.

Botany Rambles. Part I.: *In the Spring*. (Horace Marshall & Son.)

In this wintry weather one thinks of the spring that is coming and takes comfort, and, in fact, it has been quite a pleasure to read this

delightful little *brochure* of only one hundred large-print pages. The book is primarily addressed to children, and the writer addresses them in his preface. He tells them to go out into the country and look out for the things he describes, and, if they have no time to read his book as well as to go out, then not to read it but to go out instead. The author writes easily of the well known trees, such as the sycamore, the beech, the oak, the ash, and the birch. Speaking of the silver birch our author says: "If you can find this birch tree—for that is its name—in a place where you can reach it and are allowed to touch it, break off a little piece of its thin bark. Does it not peel off easily and is it not nice and thin and crisp to touch?" Let us hope that this early familiarity with the bark will prevent a more intimate acquaintance with the twigs. But we are digressing. The book contains several excellent diagrams of well known flowers, such as the cowslip, the anemone, and the primrose. We can heartily commend this little book to teachers and others who wish to cultivate and foster a love of Nature and her ways in the minds of their young charges.

"Cambridge Physical Series."—*Electricity and Magnetism*.

By R. T. GLAZERBROOK. (Price 7s. 6d. Clay.)

The standard of this elementary text-book of "Magnetism and Electricity" is approximately that required for the Intermediate Examination in Science of London University, and provides not only the usual descriptive matter, but also some sixty experiments to be worked out by the student in the laboratory. We think the least satisfactory part is that dealing with the theory of electrolysis. It is calculated to confuse a beginner. Contrary to the explanation offered by the dissociation theory, we are told (page 304) that in the electrolysis of a solution of sulphuric acid the molecules of the acid are decomposed by the electric forces; and, although on the next page some modification of this statement is made, yet the explanation lacks clearness. On pages 202 and 202 we notice that "chloride of ammonia" is written for "chloride of ammonium," and on page 192 "iodine of silver" appears instead of "iodide of silver." The printing and figures are excellent throughout, and, as far as is possible in an elementary treatise, the modern developments of the subject receive recognition.

A Manual of Zoology. By RICHARD HERTWIG. Translated and Edited by J. S. KINGSLEY. (Price 12s. 6d. net. G. Bell.)

This is an American translation of the fifth German edition of the well known "Lehrbuch der Zoologie." The translator has modified the original in certain particulars in order to bring it more into line with American usage and so that it may have more special reference to American forms of life. Rather more than a quarter of the book is given over to an exposition of the general principles of zoology, and this portion, in particular, is most interesting. The residue of the volume is devoted to a systematic survey of the animal kingdom. The figures are extremely plentiful and excellent in quality, and an exhaustive index is provided. The work can be unreservedly recommended.

Elizabethan Critical Essays. Edited, with an Introduction, by G. GREGORY SMITH. 2 vols. (Price 12s. net. Clarendon Press.)

For a serious study of English literature such a book of documents is almost as essential as Stubbs' "Charters" is for a study of history. The texts here collated have hitherto lived dispersedly in many hands—rare volumes, expensive reprints, prefaces to obscure plays and poems. Even in the London Library the student could not find all. Thus, merely to sample the table of contents, we have Gascoigne's "Certayne Notes of Instruction," Lodge's "Defence of Poetry," the Spenser-Harvey Correspondence, Stanyhurst's "Dedication to the Translation of the Aeneid," More's "Palladis Tamia," Carew's "Excellency of the English Tongue." There is no denying that a perusal of the work as a whole produces a feeling of satiety, not to say nausea. It is a Gargantuan banquet: the same dishes are served again and again with different dressings; and they are composed mainly of a "crambe repetita"—variations on classical criticisms, and these mostly at second hand. Yet, for the student who desires to get at the roots of English criticism, to observe how theory and practice reacted on one another, to trace to its beginnings the never-ending strife between the classical and romantic, to estimate the respective influences of France and Italy on our native literature, the work is a storehouse of facts.

"Pocket-book Classics."—*Satires, Epistles, and Ars Poetica of Horace*. (G. Bell.)

We have already commended more than once these dainty little editions, and need only state that the text is taken from the last edition of the "Corpus Poetarum" and is faced by Conington's translation, the best we have, and in our judgment the most adequate of that great scholar's many essays in translation. The prices range from 1s. 6d. to 2s. 6d. net, according to the binding.

Fractional Distillation. By SYDNEY YOUNG. (Price 7s. 6d. Macmillan.)

The separation of the constituents of a mixture of liquids by the process of fractional distillation is such a common operation in the chemical laboratory and in many industries that this book is certain to appeal to a large number of workers. The researches of Dr. Young in

this department are well known to all chemists and physicists, and the value of the book is much enhanced by the fact that it is no mere compilation, but represents much of the author's own work. At the same time, full justice is done to the labours of others, and at the end of each chapter abundant references to the original sources of information are given. In short, it is a most comprehensive and reliable guide to the subject, and no organic chemist, in particular, can afford to be without it.

Notes on Analytical Geometry: an Appendix. By A. CLEMENT JONES, M.A., Ph.D. (Price 6s. Clarendon Press.)

For the sake either of brevity or of simplicity, several important and useful methods are generally omitted from text-books of analytical geometry. Some of these are here described with considerable skill by Dr. Clement Jones. For example, the equation of the straight line which passes through a given point and has a given direction is employed with advantage in solving many problems; so also are the expressions for the co-ordinates of a point on a conic section in terms of a single variable. The book is intended to serve as an appendix to other manuals, and it certainly supplies a want that many a teacher must have felt.

The Theory of Determinants and their Applications. By R. F. SCOTT, M.A. Second Edition, revised by G. B. MATHEWS, M.A., F.R.S. (Price 9s. Cambridge University Press.)

The first edition of this valuable work appeared in 1880. In the present edition, which has been revised by Mr. Mathews, a few changes have been made. An introductory chapter has been added for the use of beginners, and also new sections on determinants of infinite order and the theory of bilinear forms. Mr. Scott's incomplete bibliography has been omitted, and its place taken by a brief historical note. Without altering the size of the book, these changes distinctly add to its usefulness.

- (1) *A Primer of General History. Part I.: Ancient History*. By W. H. SALTER. (Price 2s. 6d. Horace Marshall & Son.)
- (2) *The Ancient World*. By E. M. WILMOT-BUXTON. (Price 3s. 6d. Methuen.)

A *Welgeschichte* is perhaps as common on the bookshelves of a German home as a Bible on those of an English. Probably none of us would be the worse for a little more devotion to general history. But as to the stage at which children should be initiated into it our mind is by no means clear. We are aware that the knowledge of a fact gains in value as it is brought into relation with the knowledge of other facts, and that to memorize the dates of the chief battles in English history, without some study of causes and effects, is less useful than to learn the times of the fast trains from Euston to the North. But how far can a child follow the chain of causation? At what age, under normal circumstances, is he qualified to go back to the Hittites? Unable to answer these questions, we must be content to call attention to the two text-books before us, in which ancient history is treated generally, and in an elementary way, whilst we leave their utility to be determined by others.

No. (1), by a late scholar of Trinity College, Cambridge, gives twenty-one pages to the civilization of Egypt and Western Asia, the rest of its space, or about two hundred pages, to Greek and Roman history. It is probably as accurate as it is possible for a book on so small a scale to be. The author of (2) makes our flesh creep at times. We quote an extract:

"14-37 A.D.—Tiberius Cæsar, whose deeply marked face shows the bitter heart and imperious temper which makes him an object of hatred in the capital, glances behind him at the evil and vicious youth, Caligula (37-41 A.D.), who is followed in his turn by Claudius (41-54 A.D.), who points to the shores of distant Britain, made by him a part of the Roman Empire.

"54-68 A.D.—Then the vain and wicked Nero comes past with lowering brow, and hands wet with the blood of murdered Christians. Vespasian follows, proud in the knowledge of the destruction of Jerusalem (70 A.D.), and Titus (79-81 A.D.), in whose reign Pompeii and Herculaneum were buried beneath the burning lava of Vesuvius. Then comes Domitian, hated for his cruelty, and Trajan (98-117 A.D.), the great master-builder, some of whose magnificent buildings may still be seen. The emperors are now the choice of the army, which has become all-powerful in Italy."

But the earlier parts of the volume are much better than this, and in it the stories of Egypt, Parthia, India, and so forth are told with care and particularity. One book supplements the other, and those who are on the look out for readable outlines to put into young hands should examine both these.

"Cambridge Bible for Schools and Colleges."—*The Second Epistle to the Corinthians*. By the Rev. A. PLUMMER, D.D. (Price 1s. 6d. net. Cambridge University Press.)

This volume forms a valuable addition to the excellent series to which it belongs. Like all Dr. Plummer's work, this little commentary is learned, scholarly, and thorough. The notes are models of sober and lucid statement. The most interesting feature about the present volume is its advocacy of the theory that the canonical II. Corinthians

is an amalgam of parts of two originally independent and distinct letters. Dr. Plummer's words on this point (from his preface) deserve to be quoted:—"The theory advocated in the introduction and in the notes respecting the last four chapters of the Epistle as having originally been part of another and earlier letter has been adopted with much reluctance. Years ago I wrote against it. I had then, and I have still, a great distrust of speculative dissections of documents where the arguments for disintegration are based wholly upon internal evidence and receive no support from the history of the text. But in the present case minute study of the details at last produced a conviction which became too strong for this reasonable and deep-rooted objection. In the end I was brought to the belief that the internal evidence, although it stood alone, was too often and too consistently in favour of separating the last four chapters from the first nine to be barred altogether by antecedent improbabilities." The introduction (pages i-xi) is adequate; it contains, among other more familiar features, an excellent little section on quotations from the Old Testament. There are also some valuable appendices—A, "The Personal Appearance of St. Paul"; B, "The Apocalypse of Paul"; C, "St. Paul's Thorn for the Flesh"; D, "The Rhetoric of St. Paul."

(1) *The Children's Scott*. By THOMAS CARTWRIGHT, B.A., B.Sc. (7 x 5 in., pp. viii, 166, illustrated; price 1s. 3d. Jack.) (2) *The Jack Readers*. By THOMAS CARTWRIGHT, B.A., B.Sc. (7 x 5 in.; I., pp. 111, illustrated, price 8d.; II., pp. 142, price 10d.; III., pp. 174, price 1s. Jack.) (3) *The Jack Historical Readers*. Book II. By CHARLES F. VERNON, B.A. (7 x 5 in., pp. 220, illustrated. Jack.) (4) *The Addison Temperance Reader*. By WILLIAM FINNEMORE. (7½ x 4¾ in., pp. 219, illustrated. The Addison Publishing Co.)

(1) "The Children's Scott" consists of simple selections—some sixteen in all—from the romances and poems of Sir Walter. They are well chosen and annotated by Mr. Cartwright. They make a pretty little volume, which will make children eager to read more.

(2) The three volumes of "The Jack Readers" are also by Mr. Cartwright. They contain just the right amount of prose and poetry, of fiction and fact, and pictures which children require. We should not have cut up the pages into numbered lines; nor should we have placed the hard words in groups at the beginning of the lessons, but at the end of the book. Nevertheless, the pages are neatly arranged and well illustrated.

(3) "The Jack Historical Reader" concerns the period "from the Norman Conquest to the Battle of Bosworth." It consists of well chosen incidents from the period it represents, illustrated with good pictures in colours. The subject-matter of the book is divided into eight parts, and each part is followed by a brief summary of events.

(4) Mr. Finnemore's "Temperance Reader" is as well done as such books can fairly be. But the *toujours perdrix* of temperance is rather difficult diet for the young to assimilate. It would have been better to intersperse the banquet with a greater variety of dishes. Not that the pieces chosen are unduly and unwisely forced; they are not. But the flavour is always the same, which seems to us a mistake.

"The Belles Lettres Series."—Section I. (1) *Judith*. Edited by ALBERT S. COOK. (6 x 4¼ in., pp. xxiv, 172; price 1s. 6d. net.) (2) *The Battle of Maldon, and other Short Poems from the Saxon Chronicle*. Edited, with Introduction, Notes, and Glossary, by WALTER JOHN SEDGEFIELD, Litt.D. (Do., pp. xxiii, 96; price 1s. 6d. net.) (3) Section III. *The Good-Natur'd Man and She Stoops to Conquer*. By OLIVER GOLDSMITH. Introduction and Biographical and Critical Material by AUSTIN DOBSON, LL.D. (Do., pp. xxix, 285; price 2s. 6d. net.) (4) Do., *Eastward Hoe*, by JONSON, CHAPMAN, and MARSTON, and JONSON's *Alchemist*. Edited by FELIX E. SCHELLING, Litt.D. (Do., pp. xxxi, 408; price 3s. D. C. Heath & Co.)

This excellent series of books is intended rather for students who have just left school than for those who are still at it; though the poems might be used by boys and girls in the highest form.

(1) Mr. Albert S. Cook is Professor of English Language and Literature in Yale University. He has edited the old English epic fragment before; but has so much increased his material and modified it that practically the edition is a new one. The introduction gives all that is necessary about the history, sources, art, invention, &c., of the poem, and is a good piece of work; and the notes, bibliography, glossary, &c., are all excellent.

(2) Dr. Sedgefield is Lecturer in Anglo-Saxon and English Philology in the Imperial University of St. Petersburg. His little book is admirable in every way. He gives us a good introduction and a very full glossary and bibliography; and his notes are brief and businesslike. The chief of the "short poems" is the Battle of Brunanburh.

The other two books belong to the English drama section of the series. They are well edited, and furnished with introduction, notes, bibliography, and glossary. But very little is said about the biographies of any of the writers, the main space being devoted to the plays themselves.

(3) Everything that is wanted is given in the Oliver Goldsmith volume—including the Doctor's essay on the theatre and on the register

of Scotch marriages, both of which appeared in the *Westminster Magazine*, Vol. I., 1773. The text is collated by George P. Baker, who adds a note thereon in each case.

(4) The Jonson volume also is well fitted out with all that a scholar can want—even to the letters of Ben Jonson and George Chapman relating to "Eastward Hoe," reprinted from the *Athenaeum* of March 30, 1901, and the bibliography of "The Alchemist" is particularly good. We have not come across so well edited a series of books for a long while.

Browning's A Death in the Desert. With Introduction and Notes by the Rev. G. U. POPE. (Price 1s. 6d. net. Sonnenschein.)

These notes have been evolved in the laboratory, not in the study, and contain answers to questions actually proposed by learners to the annotator. They are, as it were, a model lesson to show how a great poem should be studied. To one *dictum* we may take exception: "Browning is the most absolutely correct of all poets; one very seldom hears of the detection of any incongruity, incorrectness, or anachronism in any of his multifarious writings." This may be literally true, though in this very poem there is an allusion to telescopes; but, in the larger sense, Browning is not and does not pretend to be correct—to borrow Mr. Hutton's happy phrase, he is not dramatic, but semidramatic. Thus, he gives us here not the St. John of the Gospel or the St. John of the Revelation, but the St. John of Bishop Westcott refuting the higher criticism of Germany.

Across the Great St. Bernard. By A. R. SENNETT. (Price 6s. net. Bemrose & Sons.)

A popularly written account of a bicycling tour amid the Alps. It includes something about Switzerland, its people, industries, education, and government; a description of the passage of the Great St. Bernard Pass by Hannibal and Napoleon, and a history of the famous Hospice of St. Bernard. Plenty of good illustrations make the volume of value to those contemplating a similar tour.

Philips' New Handy General Atlas of the World. (Price 21s. net.)

This atlas has been revised and much enlarged, the new edition containing 160 coloured maps and plans, dealing exhaustively with physical, political, and commercial geography. The additional illustrations include plates of national and mercantile flags, a political map of South Africa, and physical maps of England and Wales, Scotland, Ireland, France, the German Empire, India, and the United States. There is also an index of 100,000 names. The maps are admirably engraved and printed, and the information is up to date. This handsome volume can be strongly recommended as a reliable work of reference.

"Books on Business."—(1) *Law in Business*. By HEW A. WILSON.

(2) *The Business Side of Agriculture*. By A. G. L. ROGERS, M.A. (Methuen.)

(1) The present volume is a very useful manual for business men and women. The author clearly explains what constitutes a contract, and expounds the law as affecting cheques and other negotiable instruments. As Mr. Wilson points out, no trouble ever arises when a cheque is duly honoured, but when it is not "the person presenting it looks round to see whom he can make liable." Under such circumstances the information given in the book will be found most valuable. Other chapters treat of the law concerning "Contracts for the Sale of Goods," "Bailments," "Principal and Agent," "Landlord and Tenant," and "Bankruptcy."

(2) This book, as its title sufficiently indicates, occupies itself with the "business side" of the farmer's industry—a side which has hitherto not received the attention it deserves in this country, especially since it has had to be admitted that agriculture in England does not pay. The best methods of marketing both vegetable produce and live stock are discussed in a practical manner. The author is convinced that important and favourable results would follow the development of co-operative societies for the collection and sale of farmers' produce.

Handbook to the Pentateuch. Vol. II. *Departure from Egypt to the Death of Moses*. By Rev. H. C. BATTERBURY. (Price 2s. 6d. net. Rivingtons.)

Assuming the attitude of the editor—a diocesan inspector of schools—to be the right one for the teacher, we can heartily commend the plan and execution of the present volume. But, as was indicated in a remarkable paper read by the Rev. Vernon Storr at the recent Church Congress, there is a more excellent way. Thus we do not think it tends to edification to tell the pupil without explanation or comment that the Ten Commandments were "written by the finger of God upon two tables of stone," that "they are but the law of Nature definitely expressed . . . by which men will be judged at the last day."

Selected Poems of Gray, Burns, Cowper, Moore, Longfellow. Edited by H. B. COTTERILL. (Price 1s. Macmillan.)

We have here a dozen short poems ("John Gilpin" is the only one of any length), with very full introductions and notes. For the choice of the poems not the editor, but the Intermediate Education Board for Ireland, is responsible. Given the authors and the school age, it does not seem to us such a bad selection as the editor thinks it. Mr. Cotterill is a scholar and a sound literary critic. As to derivations, which he rightly tabooes in his preface, he is quite consistent.

Whitaker's Modern Method of learning German. By C. W. WHITAKER and H. G. BRAUN. (Price 3s. net. J. Whitaker.)

The "Modern Method" is an adaptation of the old Robertsonian method. We have a consecutive story of travel with a literal inter-linear translation, divided into lessons and followed by a conversational series of questions and answers. We can commend it for the use of private students, but we much doubt whether they will learn the true German pronunciation by help of the transliteration. Here is a specimen: "Umm naysch'-sten tah'-guen punkt'-leech."

English Poetry for the Young. Compiled and Edited by S. E. WINBOLT. (Price 1s. Blackie.)

The book is cheap and well printed, but there is nothing to distinguish it from a dozen similar collections. "The Young" is an elastic term; but, if children of twelve and under are meant, we should bar Wordsworth's "Lucy Gray," for reasons we have often given, and, for more obvious reasons, Goldsmith's "Traveller" and the inevitable "Elegy."

Poetical Works of Sir Walter Scott. Edited by J. LOGIE ROBERTSON. Oxford Complete Edition. (Frowde.)

This edition is really complete, containing every known poem and fragment of verse that Scott wrote. It extends to nearly a thousand pages in double columns. We wonder how many lovers of Scott—even Scotchmen—have read "Ludyow Castle," or "Auchindrane." Mr. Robertson has done more than any previous editor in sifting from the mottoes what is really Scott's.

Britain on and beyond the Seas. By CECIL H. CROFTS. Third Edition. (Price 1s. 6d. W. & A. K. Johnston.)

We do not remember to have noticed before this useful handbook to the Navy League Map of the World; but, if we have, there can be no harm in commending once more a full and accurate narrative of the growth and doings of the English Navy. There is, of course, a reverse of the medal; and the diagram that shows that in the last ten years the amount spent on the building of warships has been more than trebled is not a matter for unmixed rejoicing. "The supremacy of the Navy" is an elastic term; it used to mean superiority to any combination of two—but this will not satisfy the Navy League. We are impelled to put in this caveat; but it does not apply to the body of the book, which is a record of sea victories.

"Macmillan's Pocket Novels by Favourite Authors."—*Philosophy 4.* By OWEN WISTER. (Price 2s.)

A novel it is not by any definition of the word, from Dr. Johnson's down to Prof. Saintsbury's, but a study of the life of two fast undergraduates at Harvard University. They are evidently drawn from the life, though the added humour is the speciality of the author of "The Virginians." If an action for libel lay against a corporation, the Harvard authorities would assuredly sue Mr. Wister for making Billy and Bertie pass in *Philosophy 4*.

Notes on S. Matthew. By Rev. C. J. HAMER. With Questions set at the Oxford and Cambridge Local Examinations. (Allman.)

A collection of notes, of the usual kind, for examination purposes. The questions printed at the end will be found useful.

"Macmillan's English Classics."—*Selections from Wordsworth.* Prefaced by LOWELL'S *Essay*. Annotated by H. B. COTTERILL, M.A. (7 × 4½ in., pp. xli, 84; price 2s. Macmillan.)

Mr. Cotterill has given us a well edited selection of Wordsworth's poems—some twenty-four in all—with Lowell's well known "Essay" prefixed. The little edition is intended, in the first instance, for the examination of the Irish Intermediate Education Board, but may well serve for others besides examination candidates. Lowell's "Essay" has its drawbacks, but, on the whole, is an excellent piece of work. The poems are admirably annotated; but the notes are, here and there, somewhat too long and spun out for beginners.

"Macmillan's English Classics."—*William Pitt.* By Lord MACAULAY. Edited by R. F. WINCH, M.A. (7 × 4½ in., pp. viii, 141; price 2s. Macmillan.)

Mr. Winch devotes a page and a half to the introduction, and makes it consist of a quotation from Cotter Morison and another from Dean Milman. But he takes his revenge in the notes, and gives us some fifty-seven closely printed pages. We think it a mistake to be so full, good as the notes are in themselves. But, then, Lord Macaulay is so allusive that it is difficult to know where to stop. Perhaps Mr. Winch has chosen the better part.

Lamb's Tales from Shakespeare. First Series. (Price 6d. T. C. & E. C. Jack.)

A handy reprint of four of the "Tales"—viz., "The Tempest," "As You Like It," "The Merchant of Venice," and "King Lear."

"Heath's English Classics."—*Ivanhoe: a Romance.* By Sir WALTER SCOTT. Edited, with Introduction, Notes, and Glossary, by P. L. MACCLINTOCK, M.A. (6¾ × 4½ in., pp. xxv, 530; price 2s. D. C. Heath & Co.)

Mr. MacClintock is commendably brief in his introduction and notes, and not too full in his glossary. He tells us all that need be said about the multitudinous historical errors of the book in his intro-

duction, which, we are glad to note, "is not an introduction to the life of Scott, nor to Scott's literary work, but tries to attain the more modest end of being an introduction to 'Ivanhoe.'" He is quite successful. His edition is a good one.

"Moffat's Plays of Shakespeare."—*Julius Caesar.* Edited, with Introduction and Notes, arranged and classified by THOMAS PAGE. Tenth edition, carefully revised. (7 × 5 in., pp. 181; price 2s. E. J. Arnold & Son.)

When a book has got into its tenth edition there is nothing more to say than that it is a good book, and has met the popular demand. This is distinctly a good edition, well annotated.

Object Lessons in Elementary Science. By VINCENT T. MURCHÉ, F.R.G.S. Stages I. and II. (6¾ × 4¾ in.; Stage I., pp. 188; Stage II., do.; price 2s. Macmillan.)

This is a new and revised edition of Mr. Murché's book on "Object Lessons in Elementary Science." It is well written, well illustrated, and brought up to date. There is no reason why it should not be as successful in its revised as in its original form. It is based on the scheme issued by the late London School Board.

Stanford's Compendium of Geography: A Glossary of Geographical and Topographical Terms. By ALEXANDER KNOX, B.A., F.R.G.S. (7½ × 5 in., pp. xl, 432; price 15s. Edward Stanford.)

This is a supplementary volume to Stanford's well known series of volumes on geography and travel. It contains not only geographical and topographical terms, but also words of frequent occurrence in the composition of such terms and of place-names. The main difficulty is one of spelling; but this has been made to conform, as far as possible, with the spirit of the code or system recommended by the Royal Geographical Society. The introduction deals with this. Of course, in pioneer work of this kind, mistakes must occur; but we do not think they will be numerous. The work of compiling the volume has been one of great difficulty, and, as far as we can judge, has been well done.

"Dent's Temple Series of English Texts."—(1) *The Lay of the Last Minstrel.* Edited, with Introduction, Notes, and Glossary, by J. W. YOUNG. (7 × 4¾ in., pp. xxiv, 188, illustrated; price 1s. 4d.) (2) *The Lady of the Lake.* Edited, with Introduction, Notes, and Glossary, by FLORA MASSON. (Do., pp. xxxii, 198, illustrated; price 1s. 4d. Dent.)

These editions are well printed and well bound and neatly illustrated. After a part assigned to the life of Scott—the same in both cases—the introductions deal with the subject-matter of the poems in a bright and interesting fashion, but at no great length. The notes are brief, not too numerous, and quite adequate. The glossary also is satisfactory in both cases; indeed, it is some time since we have met with such workmanlike editions of Scott's poems. We are glad to be able to recommend them heartily.

"Jack's Language Series."—*Class Work in English.* Book VI. (Pp. 64; price 4d. Jack.)

This is an *inductive* little book, thoroughly practical, and up to date. Children learn to do by doing: they learn language by using language, and the method and material are right. The portion of the English language included is that which deals with analysis, composition, correspondence, and picture stories. At the end of the book are added three good passages for recitation.

Landmarks of European History. By E. H. M'DOUGALL, M.A. (7 × 5 in., pp. 301; price 3s. 6d. Blackie.)

Mr. M'Dougall used to be assistant in the Tewfikieh School and Training College at Cairo. He had to struggle with a rather unwieldy syllabus of European history, borrowed from Germany, for which no books were available for his Egyptian scholars—none, at least, of the prescribed amount. He had therefore to construct a history for himself to cover the syllabus of the second of the three years for which the original syllabus was made. The result is the book before us. He begins with the growth and decline of the Roman Empire, and brings the narrative rapidly to the fall of Napoleon, and adds a supplementary chapter on the colonization of European Powers, more especially Great Britain. He has done his work well. Considering the immense period he has had to deal with, he writes lucidly, and leaves a distinct impression on the mind of his readers of the great events of European history. His pages are illustrated with many maps, four of them in colour, and he adds a good index.

CLOUGH'S *The Tudors before Elizabeth.* (7 × 5 in., pp. 164; price 2s. Ralph, Holland, & Co.)

This brief history of the foundation of modern England covers the period from 1485 to 1558. It is well written, well illustrated with portraits of the notable people, and contains all the chief movements of the time.

Laws of Health. (7¼ × 4¾ in., pp. 80; price 6d. net. McDougall's Educational Co.)

This book, which is profusely illustrated, begins with an account of the human body, and proceeds to air and water, food, care of the body, ventilation, &c. It gives a clear and simple account of all that is necessary under its title. It is a very good sixpennyworth, and should be found useful.

A Survey of the British Empire. (7 × 5 in., pp. 352, illustrated; price 2s. Blackie.)

An historical, geographical, and commercial account is given in broad outline of the British Empire in its present extent and of the ways in which it has been built up. After a short introduction emphasizing the importance of the United Kingdom the rest of the book is devoted to giving an account of the Empire continent by continent, and of British trade commodities. It is fairly full and well arranged. It will be found useful in schools.

A First History of England. Part V., 1603-1689. By C. L. THOMSON. (7½ × 4¼ in., pp. xii, 288, illustrated; price 1s. 6d. Marshall & Son.)

In Part V., as in the preceding parts of this excellent little book, original authorities have been followed both in the letterpress and in the illustrations; but it has been found increasingly necessary to have recourse to more recent and standard works. It is, however, intended that the chapters should be accompanied by oral lessons. Miss Thomson has deserved well of the little people in producing for their use so bright and fresh a volume. It is sound and interesting and remarkably well put together. It concludes with a chapter on the social life of the time, and is provided with a good index.

Little Folks of Many Lands. By LULU MAUDE CHANCE. (7½ × 5½ in., pp. 112; illustrated; price 2s. Ginn.)

This is a charmingly illustrated little book for little people. It contains seven stories of children of various countries—Indian, Eskimo, Arabian, Japanese, &c.—told simply and brightly. Appropriate nursery stories to each child are introduced; and the whole is rendered as interesting as possible. We have enjoyed the accounts very much, and particularly "Mina, the Holland Girl." But what is she doing in this gallery? There are, moreover, many other little folks asking for admission. We add our voices to theirs. It is a capital book.

Gems from the Victorian Anthology. Edited by the Right Hon. Sir M. E. GRANT DUFF. (5½ × 3¾ in., pp. xii, 397; price 2s. 6d. Sonnenschein.)

Two years ago Sir Mountstuart Grant Duff published an Anthology of the reign of Queen Victoria, which immediately became popular. He has now published gems from the same—that is, poems and parts of poems which he liked best chosen from the same collection. From a school point of view it suffers from the time limit; but taken simply as a volume of poetry belonging to the reign it would be hard to beat. The earlier and the middle and late middle days of Victoria were a period peculiarly rich in verse, and Grant Duff has given us of the best of these. There is no poem in the book which did not deserve to be quoted, and few there are which did not richly so deserve it. Few men could have made so excellent a collection.

"Little Biographies."—*Johann Wolfgang Goethe.* By H. G. ATKINS. (6¾ × 4½ in., pp. xiii, 180, illustrated; price 3s. 6d. Methuen.)

Mr. Atkins has produced an excellent "little biography" of Goethe. Glancing lightly over the periods of selfishness and of things not desirable, he has chosen the volumes of the "Dichtung und Wahrheit" as the chief source from which to illuminate the earlier days down to his first settlement in Weimar in 1772, and generally and for the rest of his life he has had recourse to some seven well known biographies. The little book gives the effect of a whole, though naturally a much curtailed whole, and incidentally mentions all the leading works of the poet. It has been a labour of love, and is well done.

Reading and Writing. Compiled by H. R. BEASLEY. (Price 6d. Jack.)

A graduated course of exercises for teaching children to read handwriting is, as far as we are aware, a new idea, and it has been well carried out. The facsimiles are most of them worth reading, and some of them—for instance, those of Charles Kingsley, Robert Browning, R. L. Stevenson, and General Baden-Powell—will interest teachers even more than pupils. There is a delicate irony in putting Queen Elizabeth's autograph, the easiest of all, first, and that of a modern schoolgirl last. The latter we have at last deciphered, but it is nearly as hard as Lord Melbourne's letter that we once set for an extra prize.

Hints to Reciters. By the late CLIFFORD HARRISON. (Swan Sonnenschein.)

A melancholy interest attaches to these "hints," a dying legacy from one of the most famous of recent reciters, cut off in his prime, and without a rival after the retirement of Mr. Brandram. Mr. Harrison makes no pretence of communicating his art; he tells us that a lesson from a competent master of elocution is worth all learned directions of the text-books. What he does, and does successfully, is to guide the young reciter in the choice of passages, to point out what "cuts" are permissible and expedient, and to warn him against the pitfalls to which he is most liable.

Poet's Corner. A Book of Verses for Children. (Price 1s. E. Arnold.)

Simple poems, variety, big print—the book fulfils these three essentials. Perhaps there are too many poems about children, such as Longfellow's "The Children's Hour" or Mrs. Browning's "A Child's Thought of God," and too few poems of action; but on the whole the choice is commendable.

"Cassell's National Library."—(1) *Thoughts on the Present Discontents.* By EDMUND BURKE. (2) *King Richard II.* By WILLIAM SHAKESPEARE. (3) *Sartor Resartus.* By THOMAS CARLYLE. With an Introduction by G. K. CHESTERTON. (6 × 4 in. each, pp. 192, 192, 213; price 6d. each. Cassell.)

These are three excellent little volumes recently added to "Cassell's National Library." The first two are edited by Mr. Henry Morley, and the third by Mr. G. K. Chesterton—all very briefly and well. The first has four short speeches of Burke's added; the second has extracts from Langland and Gower dealing with "Richard II.," and the third has certain testimonies of authors and a summary of the essay.

"Carpet Plays." Edited by LUCIAN OLDERSHAW. (1) *Two Old Children.* By W. TEIGNMOUTH SHORE. (2) *The King's Command.* By CARLTON H. TERRIS. (3) *Spoken Thoughts.* By MARGARET B. CROSS. (Price 6d. net each. R. Brimley Johnson.)

Mr. Oldershaw was sometime Secretary of the Oxford University Dramatic Society. The plays which he edits are bright and amusing, and can be acted in a drawing-room or lecture hall. Very few properties are required. There should be a good run on them at Christmas-time. Permission to perform them can readily be got for a small fee from Mr. Johnson, the publisher.

The Work of the Prophets. By ROSE E. SELFE. (Price 2s. 6d. net. Longmans.)

This forms the third volume of the series "Simple Guides to Christian Knowledge," the scope of which we have indicated in previous notices. Miss Selfe has succeeded in maintaining the simple but by no means childish treatment of the earlier volumes in a portion of the Bible which lends itself far less readily than the history. The lives, circumstances, and main teaching of each Prophet are clearly set forth. There is no attempt at critical exposition, not even a hint that there are two Isaiahs, and perhaps this is well.

English Colloquialisms with their French Equivalents. By ARTHUR H. SMITH. (Hachette.)

In reviewing a similar work of French origin, we pointed out how much more need there is for an English-French than for a French-English collection of idioms. This little book is on a modest scale, and it only offers one equivalent; but the idioms are well chosen, and the equivalents generally apt. Once or twice we may take exception: "The grapes are sour.—Ils sont trop verts." "Do you see any green?"—"Without 'in the corner of my eye' we should not understand." "The little shoe-blacks.—Les petits savoyards."

Sir Thomas More's Utopia. Edited, with Introduction and Notes, by J. CHURTON COLLINS. (7½ × 5 in., pp. lii, 283; price 3s. 6d. Clarendon Press.)

This very full and excellent edition is based on that of Dr. Lupton, and is intended to meet the needs of those students who require some elementary philology and those who will be chiefly concerned with philosophy and history. Consequently, the editor has sought to expand and supplement Dr. Lupton's somewhat brief treatment of these subjects, and to supply more rudimentary information than he thought necessary. Mr. Collins has given us an interesting introduction dealing with the life of More, the origin and inspiration of the "Utopia," its framework and models, the plot and the purpose of the work—adding a brief note on early editions and translations. The notes are somewhat full, but none the worse on that account; and there is a philological glossary. In fact, the book is complete in every way—down to an appendix containing two letters, one from Peter Giles to Hierome Buslyde and the other from More to Peter Giles. We do not know of any school edition to compare with it.

The author of "Everyday English," Mrs. Rankin, writes from Minneapolis pointing out that she by no means advocates discarding English grammar entirely from the school curriculum, but merely the postponement of the study till the child can receive it without aversion, "My system is intended to correlate closely with a short, but strong, course in technical grammar."

Hazell's Annual for 1905. (Price 3s. 6d.)

The special article on "Education," which extends to thirteen pages, includes a full account of the Act of 1902 and a judicious comment on the Passive Resistance movement and the Welsh opposition to the Act.

We have received from the French Ministry of Public Instruction the seventh volume of *Statistique de l'Enseignement Primaire*, 1901-1902. This quinquennial census dates back from the Special Commission appointed in 1876. Since the last census the number of public schools (elementary, superior primary, and maternal) has increased by 288, and the number of masters and mistresses by 3,299; but the staff is still pronounced insufficient, there being 7,456 classes numbering over fifty pupils—some actually reaching a hundred. There has been a considerable decrease in Congregational schools for girls and maternal schools, while adult courses have nearly doubled. The Budget has risen by 11,000,000 francs.

JOTTINGS.

AT the Half-Yearly General Meeting of the College of Preceptors, January 28, it was announced from the chair that the opinion of two eminent counsel, the Right Hon. R. B. Haldane and Mr. T. T. Methold, had been obtained on certain legal aspects of the new Charter drafted with a view to federation. Counsel held that there would be no legal difficulties in the way, and that a dissentient minority would have no *locus standi*. On the other hand, they were of opinion that the Lord President of the Council would not be disposed to advise the grant of the new Charter, nor could any alterations in it be made that would be likely to commend it to the Privy Council. The tendency of the times was to regard teachers from a different point of view from that of 1849, when the Charter of Incorporation was granted.

THE *Schoolmaster* relates at length an amusing incident which "transpired" (*sic*) at the Liverpool Conference. Dr. Macnamara handed to Sir W. Anson a sum that had been set to children of eleven in a Berkshire scholarship examination. "He had seen the question on the 15th of October last and had not quite satisfied himself about the answer yet. If Sir William could not work the sum, there was no one in England could." Sir William, after an hour and a half's reflection, adroitly avoided the problem, answering in parliamentary language that he required notice of that question. The problem was: "A franc is worth 9½d. and a dollar 4s. 1½d. What is the least debt in dollars that can be paid in francs?"

WE can cap the story by one of Mr. Matthew Arnold. Mr. Arnold had just returned from one of his official visits to the Continent and was extolling the superiority of French teaching. "For instance," he said, "in arithmetic they do everything by the unitary method." A Charity Commissioner who was present asked for an explanation of the term, and, failing to understand Mr. Arnold's account, asked how he would work by the unitary method the sum, "If 2 men plough a field of 10 acres in 2 days, how many days will it take 4 men to plough a field of 5 acres?" Mr. Arnold pleaded that he could never do a sum in his head and retired, with the sum written down, into a corner. When, after a long interval, he appeared again, Mr. R. was departing, and a voice was heard at the top of the stairs crying: "I say, R., was that a real sum you set me or only a sell?"

MR. LANCELOT's complaint at the North of England Conference that examinations were a money-making business in which all kinds of people, except schoolmasters, participated is not borne out by the last balance sheet of the College of Preceptors. The Statement of Assets and Liabilities shows a balance to the good of nearly £19,000. The examination fees for 1904 amount to over £11,000, while the expenditure under this head, including salaries of secretaries and Dean's fees, are roughly £8,000.

WHATEVER happens at Oxford and Cambridge, Greek at Uppingham must endure. "Every head master of a school like ours is compelled to uphold Greek." He is bound by the scheme "to supply practical and liberal education," and "liberal education includes Greek." It is strange that this simple syllogism of the Rev. E. C. Selwyn did not convince his sixth form. When he set them an essay on the subject they one and all opined that, without compulsory Greek, Greek must go. We hope that Mr. Selwyn when he gave back the essays pointed out how mistaken they all were.

"WHAT is unreasonable is to compel students who are not going to study Greek after the Little-go to spend a year or two at the end of their school days in learning just enough of it to pass. It is a misfortune that, just at the moment when so many secondary schools are being reorganized on a plan which gives due scope to English as a means of humanistic training, the old Universities should slam the door in their faces."—*Morning Post*.

"THE *locus classicus* on the value of Greek and Latin happens to be the *dictum* of a great Greek scholar—Dr. Gaisford. 'The study of these languages,' said the Dean, 'not only introduces the student to a noble literature, but it leads to places of considerable emolument in the Church of England. In regard to the utilitarian advantage he spoke for specialists; on the literary question he spoke on behalf of every undergraduate.'"—*Observer*.

AT the dinner of the Incorporated Association of Head Masters the President, Mr. Went, told a good story, for the authenticity of which he vouched. A head mistress recently received a letter from a mother, asking that Selina might be excused from Scripture lessons—"her

father and I, having given the subject our careful consideration, have come to the conclusion that French conversation will be more useful to her hereafter."

AT the same dinner Dr. Warre, discussing the Greek question, spoke of "the clamorous crudities of blatant utilitarians," and Mr. Moss put the points on the *i's* by reading extracts from Prof. Ray Lankester's letter to the *Times*. Canon Bell revealed a Cabinet secret. He had once given the casting vote for Mr. Moss against Mr. Thring for membership of the Conference Committee. Dr. Macclure invented a happy euphemism for paying taxes—"Once a year I think imperially."

A CHILD admitted to a hospital, being asked what was his religion, is reported to have said: "If you please I don't drink beer."

THE degree of Doctor of Letters at the Sorbonne has just been taken, for the first time in history, by a lady—Mlle. Merlette de Provins. The subject of her thesis was "The Life and Works of Elizabeth Barrett Browning."

MR. C. T. MILLIS presented a valuable paper on "The Teaching of Arithmetic" to the London County Council Conference of Teachers. We hope the paper will be printed and widely read.

IT is stated that in some of the Leeds schools every child is a depositor in the Yorkshire Penny Bank. The total amount deposited is almost £40,000, an average of over 9s. a child.

MANY curious reasons are given for absence from school. Here is one taken from the *Schoolmistress*: "Dr sir; Samuel cannot come to school this afternoon, as he has glued his head to the dresser, and we have not been able to separate him yet."

A HEATED discussion took place at Aberdare, where some members of the Education Committee wanted to dock the teachers' salaries during the Christmas holidays, on the analogy of the colliers in the district, who received no pay when the pits stood idle. The motion was not carried.

"NO country in the world comes near us in our hunger for examination results and certificates to hang up in our bedrooms," said Mr. Morant the other day at Wigan. He has evidently been reading "Love and Mr. Lewisham."

AN appeal, signed by peers, bishops, and other influential persons, has been issued to all Local Authorities, calling upon them to have regard to the formation of character as the principal aim of education; and urging that in all schools effective moral training based upon those Christian principles which ought to pervade all teaching and discipline should be provided. To this end Bible teaching should be continued, supported by influences inspired by the spirit of that teaching.

MRS. DAVIES, in the *Contemporary Review*, has some severe things to say about teachers of cookery. She instances a girl with a first-class diploma for all branches of high-class and plain cooking who was unable to prepare a dish of mutton cutlets, and gravely stated that she did not understand joints. Another told her managers that she could not teach stewing unless she had a gas-stove. No doubt there is much unreality in the instruction given. The lessons ought to enable the pupils to make the best use of their cottage grates.

THE *Morning Post* is devoting itself to educational topics. It has printed a letter from Mr. Thomas Allen.

WE extract the following curious puzzle from the *Leeds and Yorkshire Mercury*: "It is startling to find that there is no essential subject in our educational equipment to which less attention is paid in this country than geography. The reason seems to be that it is more profitable from the point of view of tuition to teach something else." The remark is not uninteresting as indicating the attitude of mind of the reporter towards education.

WITH regard to the use of the divining-rod, a somewhat flippant correspondent in the *Times* points out that the rod has also been a powerful educational instrument for locating, evoking, and stimulating the latent forces of the brain, especially in early youth—forces which no other known agency could elicit.

"To yongs gentlemen whish english concerning lessons and private circles. References and photograpie to "Utile dulce" this news-

(Continued on page 140.)

TWO NEW LATIN BOOKS OF SPECIAL INTEREST AND IMPORTANCE

BLACKIE'S LATIN COURSE

(Based on Conversation throughout)

By E. H. SCOTT, B.A., and FRANK JONES, B.A.

The most successful endeavour to apply modern methods to the teaching of Latin. The First Course has been adopted in the leading Preparatory Schools, Girls' High Schools, and in the Lower Forms of the great Public Schools. Its success has caused a Second Part on the same lines to be prepared. This Part is now issued.

The Second Course develops the methods of the First, modified to suit the different stage which the pupil has reached. It consists for the most part of exercises (*præparatio, lectio, interrogatio, grammatica*) based on Caesar's First Book, and so arranged that the pupil is led gradually and systematically to acquire a mastery of the elementary syntax of the complex sentence. The oral methods begun in the First Course are continued. The original text of Caesar, and easy passages from other authors, are given, to be read after the preparatory exercises are worked through.

A special feature of this book is that all the long vowels are marked, including the "hidden quantities" in such words as *cōsul, iūnx, quārtus*; thus introducing the quantitative system advocated by Professor Postgate in England, and Professors Hale and Buck in America.

In response to numerous suggestions from teachers, a number of illustrations are included in the First Part.

SOME OPINIONS OF THE FIRST LATIN COURSE.

The **SCHOOL WORLD** says:—"This is quite the best book hitherto published for beginners, and we venture to prophesy that this, or others written on the same principle, will supersede all existing manuals."

THE JOURNAL OF EDUCATION says:—"We greatly prefer this Latin book for beginners to the comic Latin primer which was the last book of the kind we noticed. This bears on the face of it the marks of direct experience. The plan of the book is thoroughly sound, and it has been well carried out."

Professor J. P. POSTGATE, in the *Classical Review*, says:—"It is clear and practical in its plan and arrangement, the sections (*capita*) seem to be of the right length and properly graduated in difficulty, the importance of pronunciation is recognized; in a word, it appears to be a very teachable book."

THE TEACHING OF LATIN

By W. H. S. JONES, M.A.,

Perse School, Cambridge.

This little book will be of special interest in view of the present critical position of Classics in the Universities and Public Schools. It consists of four chapters: (1) The Teaching of Classics, (2) The First Year of Latin, (3) The Second Year of Latin, (4) The Third Year of Latin; and the author gives a suggestive scheme for a three years' course, founded on personal experience, and of proved success. Price 1s.

[Ready immediately.]

BLACKIE & SON, LTD., 50 OLD BAILEY, LONDON.

paper's redaction. Discretion honnoursake."—This conundrum from a Stockholm newspaper appears to mean that a teacher of English requires pupils.

A CORRESPONDENT adds to our specimens of French-English the following from the *Daily Telegraph*:—"bon volonté" (editorial); the Princess had been greatly touched by their kindness, and wished him to say to Mme. Rejane: "Mlle. Remerciements" (report of a *matinée* performance for the children); "Monsieur Anglaise désire, &c." (advertisement of an Englishman seeking a post in France on the strength of his knowledge of the lingo).

CANON H. C. BEECHING, D.Litt., has consented to lecture on "The Spiritual Teaching of Shakespeare" to the members of the Central Guild on Friday evening, March 17, at Bedford College, York Place, Baker Street; hour 8.15 p.m. Tickets for this lecture can be obtained from Miss Burns (Hon. Sec., Section D), 36 Norland Square, W.; and, as space is limited, it is requested that applications for these be made before the end of February.

MR. FRANK J. ADKINS writes to correct the statement that he is Head Master of the Secondary School for Boys at Salford: "I was unable to accept the post owing to the conditions attached to it."

A CASE of impudent imposture given at length in the *East Kent Advertiser* shows how casually appointments to head masterships are sometimes made. A man calling himself H. W. Ord, M.A., was elected by the Governors to the Head Mastership of Crewkerne Grammar School on the strength of testimonials written by himself certifying his merits as head master of a school which has no existence. The name assumed by the impostor is that of a distinguished assistant master in Blackheath School. "Quis gubernabit gubernatores?"

MR. CLOUDESLEY BRERETON will deliver three lectures at the London School of Economics on the 13th, 16th, and 20th, at 8 p.m., on "The Organization of Modern Languages Teaching in Great Towns." Fee 2s. 6d.

THE death of the Rev. Lancelot Sanderson, who passed away at Worthing on December 9, removes one of the most successful of our

preparatory head masters. He was born in 1838, graduated at Clare College, Cambridge, and was appointed to a mastership at Harrow in 1865. In 1869 he succeeded Mr. Bernaise at Elstree.

"DIE Schultafel ist schwarz, viereckig und aus Holz gemacht."
"The School Board is black, angular, and wooden."

THE total number of schools up to December 31 recognized for Regulations 3 (3) and 4 was 1,216; 300 more were provisionally recognized. For Regulation 3 (2) (ii), 21 schools were recognized. Of these, 41 schools were Scotch, 29 Irish, and 33 Indian and Colonial. The total number of teachers registered in Column B up to the same date was 7,671—men, 3,630; women, 4,041. Of these, 4 men and 149 women were under Regulation 3 (permanent conditions); 2,852 under 4 (2) (i) (a); 370 under 4 (2) (i) (b); 336 under 4 (2) (ii); 2,333 under 4* (head masters and head mistresses); 18 under 5 (2) a (16 men and 2 women); and 1,599 under 5 (2) b (ten-year clause).

OUR old friend John Paget has again been laid by the heels for failing to report himself to the police. In the evidence it came out that for over twenty years he had made his living by preying on the public as a school agent. He had never, the officer said, once found a school for a pupil or placed a pupil in a school. We know not which to admire most—the gullibility of the public or the cleverness of the impostor.

WE understand that the College of Preceptors is revising the timetable for its examinations—none too soon. As it is, a pupil taking English, Latin, French, and Arithmetic, a very common combination of subjects, has on one day seven and a half or eight and a half hours of examination, and, if he or she adds Domestic Economy, nine hours. In the Oxford Schools and the Cambridge Triposes six hours a day is the limit.

THE Local Examinations and Lectures Syndicate of the University of Cambridge announce that after the present year the arrangements made for examining Senior candidates in the Local Examinations in spoken French and spoken German will be extended to Junior candidates.

GOERZ TRIEDER BINOCULARS.

**High Power. Large Field.
Light and Compact.**

**The Finest Binocular for the
NATURALIST.**

"With my glasses—the GOERZ Trieder Binocular No. 30, 9x—I have been able to distinguish sea-birds on their nests two and a half miles away; at a distance of a quarter of a mile a bird the size of a sparrow can be recognized. No better aid for observing such far-away objects can be obtained or desired."—MR. OLIVER G. PIKE, in *Woodland, Field, and Shore*.

"I was the happy possessor of a pair of GOERZ Trieder Binoculars. Every one praises his own glass, but of all those I have tried none has been so good as this glass for my purpose."—MR. HARRY F. WITHERBY, F.Z.S., M.B.O.U., writing in *Knowledge* upon his Ornithological Tour through the Soudan.

ARE EXCELLENT FOR

ASTRONOMICAL OBSERVATIONS

In all those cases in which only a moderate Magnification is required. Nos. 10 and 20 and 30 are specially recommended for the watching of the

VARIABLE STARS,

in consequence of their very great real field of view.

On clear moonless nights the Trieder Binoculars show the following Magnitudes of Stars sufficiently distinct to allow the valuing of brightness according to Argelander's method:—

No. 10, Stars up to Magnitude 5.	No. 30, Stars up to Magnitude 8½.
No. 20 " " " 8.	No. 40 " " " 9.

SEVERAL promotions are announced in the Board of Education inspectorate: Mr. A. E. Scougal becomes Senior Chief Inspector of Schools in Edinburgh; Mr. J. Boyd will remain in Aberdeen, and Mr. A. R. Andrew is appointed Chief Inspector in Glasgow. Mr. W. G. Fraser is promoted from Junior Inspector to the position of Inspector; Mr. David Thompson, First Class Sub-Inspector, becomes Inspector; Mr. J. H. Murray, Second Class Sub-Inspector, becomes Junior Inspector; and Mr. A. McDonald is promoted from the Second Class to be a First Class Sub-Inspector.

UNIVERSITY COLLEGE, LONDON, must suffer dissolution before it can become an integral part of the University of London. The money difficulty has been surmounted, and sufficient funds are now in hand to justify the carrying out of the project. Accordingly in the ensuing Session parliamentary powers will be sought to dissolve the partnership at present existing between the College, the Medical School, and the Boys' School. Suitable provision will be made in the Bill for the latter two, and then the College proper will be absorbed in the University.

IN reference to a note on the metric system, the Secretary of the Decimal Association writes: "The case between us and the British Weights and Measures Association can be put in a nutshell: if the necessity for a change be admitted, should it be to a system in force in those countries where the bulk of our import and export trade is carried on, which system is already largely in use not only for our foreign trade, but also for purposes of science; or to a new system to be evolved by the efforts of the British Weights and Measures Association to simplify and standardize our existing weights and measures? If the latter course were followed, it would add to the confusion already caused by the complicated tables of weights and measures taught in our schools." He adds that the Bill presented by the Decimal Association has received the support of the bulk of head masters and School Boards throughout the country.

WE regret to learn as we go to press the sudden death of the Rev. A. Austen Leigh, who has been Provost of King's College, Cambridge, since 1889.

LONDON SECONDARY TEACHERS.—At a general meeting of the recently formed association at the Caxton Hall, Westminster, it was agreed to change the title to the Association of London Secondary, Art, and Technological Teachers. The secretary, Mr. P. Abbott, reported that membership had increased from 120 in May last to 450, and said that the organization was now the largest and most representative body of teachers in London. Obviously the statement is not intended to be accepted in its literal sense.

LONDON UNIVERSITY AND THE ARMY.—It may be remembered that some four years ago, at the time of the South African War, an article was published in *The Journal of Education* which discussed possible methods of improving the *personnel* of the commissioned ranks of the Army, especially in regard to their mental capacity. The most urgent reform, it was suggested, was the introduction into the Army of a larger proportion of officers drawn from the middle class. At present many promising boys from the smaller secondary schools are prevented from taking commissions in the Army by the heavy expenditure which has to be incurred for the course at Woolwich and Sandhurst. How this reform could best be effected was and still is a very difficult problem, but the new scheme of the Army Council for the granting of commissions to Universities should have very beneficial effects of the kind indicated. From the pamphlet recently issued by the University of London we learn that a student who has graduated in the University after three years' study at one of its schools, who has had some practical military training by temporary attachment to a Regular unit for periods amounting to twelve weeks, and has passed an examination in military subjects after satisfactory attendance at the courses of instruction organized by the University, will stand a very good chance of being given a commission in the Army. The advantages of the new scheme will be obvious. Firstly, the total cost of the course will be much smaller than that of the ordinary Woolwich or Sandhurst course, especially in the case of candidates whose parents live in London. In the second place, the candidate will have received a thorough education, which will fit him for many kinds of work after retirement from the Army, and there will be no need for a final decision as to a boy's career until he attains to manhood. And, thirdly, from the national point of view, the great widening of the field of choice and the introduction to the Army of a considerable number of men of specially good education and training must tend towards increasing the efficiency of the service. It is interesting to note that, whereas the policy of the Admiralty is in favour of taking charge of boys intended for the Navy at an early age, the tendency of the War Office is, so far, in spite of Mr. Arnold Forster's threat, in the other direction.

The Translation Prize for January is awarded to "Toredid."

The Extra Prize for January is awarded to "Rolobo."

PORTRAIT DE M. DIDEROT.

Moi. J'aime Michel; mais j'aime encore mieux la vérité. Assez ressemblant; il peut dire à ceux qui ne le reconnaissent pas, comme le jardinier de l'opéra-comique: C'est qu'il ne m'a jamais vu sans perruque. Très vivant; c'est sa douceur, avec sa vivacité; mais trop jeune, tête trop petite, joli comme une femme, lorgnant, souriant, mignard, faisant le petit bec, la bouche en cœur; rien de la sagesse de couleur du cardinal de Choiseul; et puis un luxe de vêtement à ruiner le pauvre littérateur, si le receveur de la capitation vient à l'imposer sur sa robe de chambre. L'écritoire, les livres, les accessoires aussi bien qu'il est possible, quand on a voulu la couleur brillante, et qu'on veut être harmonieux. Pétilillant de près, vigoureux de loin, surtout les chairs. Du reste, de belles mains bien modelées, excepté la gauche, qui n'est pas dessinée. On le voit de face; il a la tête nue; son toupet gris, avec sa mignardise, lui donne l'air d'une vieille coquette qui fait encore l'aimable; la position d'un secrétaire, d'État, et non d'un philosophe. La fausseté du premier moment a influé sur tout le reste. C'est cette folle de madame Van Loo, qui venait jaser avec lui tandis qu'on le peignait, qui lui a donné cet air-là, et qui a tout gâté. Si elle s'était mise à son clavecin, et qu'elle eût préludé ou chanté:

"Non ha ragione, ingrato,
Un core abbandonato,"

ou quelque autre morceau du même genre, le philosophe sensible eût pris un tout autre caractère; et le portrait s'en serait ressenti. Ou, mieux encore, il fallait le laisser seul, et l'abandonner à sa rêverie. Alors sa bouche se serait entr'ouverte, ses regards distraits se seraient portés au loin, le travail de sa tête, fortement occupée, se serait peint sur son visage; et Michel eût fait une belle chose. Mon joli philosophe, vous me serez à jamais un témoignage précieux de l'amitié d'un artiste, excellent artiste, plus excellent homme. Mais que diront

mes petits-enfants, lorsqu'ils viendront à comparer mes tristes ouvrages avec ce riant, mignon, efféminé, vieux coquet-là?

By "TOREDID."

Myself. I love Michael; but I love truth better still. It is not a bad likeness. To those who fail to recognize him, he may say, like the gardener in the comic opera: "That is because he has never seen me without my wig." It is full of animation, and does justice alike to his gentleness and to his vivacity, but it is too young-looking; the head is too small, and the face is as pretty as a woman's—ogling, smiling, affected, mincing, and pursing up her lips. There is nothing of the soberness of tint one notices in the portrait of the Cardinal de Choiseul, and the sumptuousness of the attire would be the ruin of the poor author should his dressing-gown be assessed by the collector of the poll-tax. The writing-desk, books, and accessories could not be better if the colouring was to be brilliant and the general effect harmonious. Sparkling near at hand, the colouring stands out boldly when viewed farther off, and especially the flesh tints. The hands withal are beautiful and finely modelled, though the drawing of the left is faulty. The sitter faces us; his head is bare, and his gray forelock, with his affectation, makes him look like an old coquette who still displays her airs and graces, whilst the attitude is rather that of a Secretary of State than that of a philosopher. It is that giddy Madame Van Loo, who would chatter to him whilst he was being painted, who made him look like that, and so spoiled everything. Had she seated herself at her harpsichord, and played or sung:

"Nought, ingrate, do know of reason
Hearts sore hurt by lovers' treason,"

or something else of the same kind, the impressionable philosopher's mood would have been entirely different, and this would have found expression in the portrait. Or, better still, he should have been left alone to lose himself in reverie, for then his lips would have been parted, there would have been a dreamy, far-off look in the eyes, the face would have borne the impress of the working of the busy brain, and Michael would have produced a fine work. My charming philosopher, you will ever be to me a valued memorial of the friendship of an artist—an excellent artist, but a still more excellent man. But what will my grandchildren say when they come to compare my dull writings with that smiling, dainty, effeminate, simpering, coquettish old man?

(Continued on page 146.)

CLERGY MUTUAL ASSURANCE SOCIETY,

2 & 3 THE SANCTUARY, WESTMINSTER, S.W.

FOUNDED 1829.

Patrons—THE ARCHBISHOP OF CANTERBURY; THE ARCHBISHOP OF YORK.

President—THE BISHOP OF LONDON.

Vice-President—THE LORD HARRIS.

Chairman—THE DEAN OF CANTERBURY.

Deputy-Chairman—SIR PAGET BOWMAN, BART.

Secretary—W. N. NEALE, Esq.

Actuary and Manager—FRANK B. WYATT, Esq., F.I.A.

The Society offers the **BENEFITS of MUTUAL LIFE ASSURANCE** on highly favourable terms to

THE CLERGY AND THEIR RELATIVES.

THE WHOLE OF THE PROFITS BELONG TO THE MEMBERS.

Accumulated Fund, £4,194,485. Annual Income, £398,982.

Bonuses Distributed, £3,723,720.

The **ANNUAL PREMIUMS** are **LOWER THAN THOSE USUALLY CHARGED.**

Under the "**REDUCED PREMIUM**" system—applicable to Whole-Life and Endowment Assurances—only **FOUR-FIFTHS** of the ordinary Annual Premium is payable, the other one-fifth remaining a debt to be repaid out of Bonus.

Notwithstanding the **LOWNESS** of the Premiums charged, the **BONUSES** are on an **EXCEEDINGLY HIGH SCALE.** For the 20 years ending May, 1901, the Bonuses distributed were equal to an average Cash Return of no less than **46 per cent.** of the Premiums paid.

The **CONDITIONS OF ASSURANCE** are most favourable, and **SURRENDER VALUES, PAID-UP POLICIES, and LOANS ON DEPOSIT OF POLICIES** are all on an exceedingly liberal scale.

IMPORTANT NOTICE.

No Agents employed and no Commission paid for introduction of business, whereby about £10,000 a year is saved to the Members.

Assurances can be readily effected by direct communication with the Office,

2 & 3 The Sanctuary, Westminster, S.W.

MERRYWEATHERS,
FIRE ENGINE MAKERS TO H.M. THE KING,
63 LONG ACRE, LONDON, W.C.
WORKS: GREENWICH ROAD, S.E.

We classify the 125 versions received as follows :—

First Class.—Elephas, Garrymore, Chingleput, Lydia Prima, Menevia, Seabury, Tacitus, O.F., Amry, Prestkrage, Toredid, Chemineau.

Second Class.—O.W., Roundhill, Michael, Orient, H.M.T., D.F., Cantab, Fortes et Fideles, Scavenger, "Little Fl.," Nephest, S.W.T., Borealis, M.B., Eicarg, E.G.D., D. de V., Annunziata, Primrose, Crescent, Flandria, Shakspeare, Orme, Aurora, A.P.W., M.N.B., Olicana, Uncas, Chestnut, Taugenichts, Nellie Grey, Dudevant, Brionne, Altnacaille, Das ewig weibliche, Glenleigh, Mars, Nem, Chat huant, Llewellyn, Verb sap.

Third Class.—B.T., Mende, King Charles, Viator, Irish Elk, Héliotrope, Broom Stick, Buster Brown, Tête blanche, Gyp, Beau Soleil, Great Western, Capella, Robin Hood, Corklight, Merrybent, Sorbier, Frederika, Cosy, Snowdrop, Noddingham, Apathe, Sans Peur, Emilia, Le Zouave, La Bise, W.E.G., Ulmi, Cerise, Ruth, At spes non fracta, Megan, Togo, Bruno, B.A.F., Ellan Vannin.

Fourth Class.—Freda, Petite, G.B.G., J.H., Marie, Wilts, M.B.L., Mignonne, Hordle, Prig, Wilson, U.V., Volta, Rota, Nil, L.O.T., Rheims, Owlet, H.A.M., Pellico, C.P., G.E.W., Falco.

Fifth Class.—Ayacanora, Fig, Selma, F.S.A., O.A.B., Quis, C.S.C., Hopeless, Salon, Patch, Ohm, Microbe, Ovum.

A good many failed to see, what was pretty obvious from the context, that the "Portrait of Diderot" was one of a series of notes on pictures in the Salon. Hence the first word was either omitted or misrendered "in my opinion." "I. I like," &c., is almost as bad from its awkwardness. Again, not many seemed to perceive that the first sentence is a paraphrase of "Amicus Plato, sed magis amica veritas."—"I love the artist, but I love truth still more." *C'est qu'il*, &c., was often slurred over: "What's wrong with the picture is," &c., or "It's all along of his," &c. I have not been able to identify the comic opera. *Très vivant*: "A telling portrait," not "an exact likeness," as the context shows: "has caught the good-nature of the original and sprightliness as well; but," &c. *Faisant le petit bec = la petite bouche*: "pursing up her lips and simpering." *La sagesse de couleur*: "the sober colouring of his portrait of the Cardinal of Choiseul." The funniest of many wild renderings was "a cardinal bird from Choiseul." *Vient à l'imposer*: "takes it into his head to assess the poll tax by the cost of his dressing gown"; not "to tax his dressing gown." *Quand on a voulu*, &c.: Few observed the difference of tenses; the artist resolves at starting on a brilliant scheme of colouring and then

endeavours to make the colours harmonize. *Qui n'est pas dessinée*: "which is only sketched"; "out of drawing" is far too strong, and "not in the picture" would be a contradiction in terms. *Toupet gris*: "gray lock," as of a famous artist lately deceased. *La fausseté*: "The wrong impression at starting." *C'est cette folle*: "It was the fault of that giddy creature, that gay rattle." He certainly would not have called his friend's wife a mad woman, still less a fool. There was no need to translate the Italian, but, as it puzzled several, I will translate:

"Ingrate, a woman's heart by treason
Abandoned has no power to reason."

Ses regards: "his abstracted gaze would have been fixed on space [Milton's "looks commercing with the skies"], and his features would have reflected the working of his busy brain." *Tristes ouvrages*: "painful lucubrations"; *coquet*, "a beau." The *saccadé* style of the original must be preserved—notes, jottings, not finished sentences.

EXTRA PRIZE.

Of the 121 competitors, not more than 5 per cent. gave a correct rendering of all the twenty phrases. Again, a literal version, as "To take a step backwards in order to jump further," could not be allowed to serve. Few availed themselves of the permission to supply a context; yet apart from the context it is in some cases impossible to suggest the right turn. The very fact that these and similar phrases have been naturalized shows that there is no exact equivalent, and those suggested below have no pretension to be more than approximations. In a weekly contemporary "a success of esteem" was branded as a meaningless phrase, and on the very next page it was used in an editorial.

1. "Chercher midi à quatorze heures."—To look for knots in a bulrush.
2. "Esprit de corps."—Corporate spirit, loyalty to his order; not public spirit, nor clannishness, partisanship; which are always used *in malam partem*.
3. "L'esprit des autres."—The title of Edouard Fournier's well known work—old saws and modern instances; wit at second hand.
4. "A la guerre comme à la guerre."—"To take pot luck" is the nearest English, but our phrase is confined to eating. Sometimes "to rough it" will suit; to take the rough with the smooth.
5. "Tenir un salon."—To receive, to hold a drawing-room; but in England we lack both the word and the thing. Neither of the suggested

THE MISSES TEMPLE AND VAUGHAN introduce—gratis—to Heads of Schools and Families, Physical Culture, Art, Science, Music, and Language Mistresses, Secretaries, Matrons, Housekeepers, &c.—83 Chester Square, Belgravia, S.W.

ENGLISH GOVERNESS—good French, fluent German (acquired abroad, 4½ years), good Music (R.A.M., L.V.C.M.)—requires an Engagement, School or Family (Non-resident). Seven years' experience.—Miss B., 126 King Edward Road, South Hackney.

GAMES AND GYMNASTIC MISTRESSES with exceptional qualifications can be obtained on application to A. ALEXANDER, Principal, Physical Training College, Southport.

* Replies to these Advertisements should be addressed "No. —, The Journal of Education, 3 Broadway, Ludgate Hill, E.C." Each must contain a loose stamp to cover postage on to advertiser. Post Cards will NOT be sent on.

School and Teachers' Advertisements are continued on pages 148, 149, 150, and 151.

phrases connotes the reunion of intimate friends, or a coterie of which a distinguished lady is the centre.

6. "Fin de siècle."—Up to date; in the latest fashion; decadent.
7. "Succès d'estime."—A meritorious performance.
8. "Vous m'en direz des nouvelles."—What do you say to that? Said by a host recommending some dish or wine, or a connoisseur pointing out some exquisite work of art.
9. "Reculer pour mieux sauter."—To stoop to conquer.
10. "Tout comprendre, c'est tout pardonner."—Intolerance is the child of ignorance.
11. "L'âme damnée."—The humble friend; a mere tool or catspaw; the M.P. whose watchword was, "I say ditto to Mr. Burke."
12. "Après cela il faut tirer l'échelle."—That takes the cake (more often in a bad sense of some gross blunder); there's nothing more to be said.
13. "Une pièce de résistance."—The joint or principal dish at a dinner; so used of a man's favourite topic or standing argument.
14. "L'ancien régime."—Pre-revolutionary times; the old order of things.
15. "Un ballon d'essai."—Kite-flying; a feeler.
16. "Un cheval de bataille."—Hobby horse; King Charles's head.
17. "Il ne faut jurer de rien."—Never prophesy unless you know; nothing's certain in this world but death and taxation.
18. "L'amende honorable."—An ample apology.
19. "Rien n'est sacré pour un sapeur."—He sticks at nothing; he has the devil's own impudence. From a comic song of Madame Thérèse.
20. "Qui trop embrasse mal étreint."—Grasp all, lose all.

A Prize of Two Guineas is offered for the best translation of the following lyric from Hoffmann von Fallersleben:—

Ein Gärtlein weiss ich noch auf Erden,
Drin wandl' ich gern bei Tag und Nacht,
Das kann mir nie verwüstet werden,
Es ist von Engeln stets bewacht.
Da zeigt sich noch den Augen immer
Der Himmel wolkenleer und blau,
Da äugelt noch wie Demantschimmer
An Gras und Blättern Himmelsthu.

Da fliessen noch die Brunnlein helle,
Nichts hemmt noch trübet ihren Lauf,
Da spriessen noch an jeder Stelle
Die schönsten Blumen morgens auf.
Da müssen noch die Klagen schweigen,
Da ist das Herz noch allzeit reich;
Da hängt an immergrünen Zweigen
Noch traulich Blüt' und Frucht zugleich.
Da gibt's noch keine finstern Mienen,
Nicht Zank noch Neid, nicht Hass noch Zorn;
Da summen stachellos die Bienen,
Und Rosen blühen ohne Dorn.
Da lächelt schöner noch die Sonne,
Und heller blinkt uns jeder Stern;
Nur nahe sind uns Freud' und Wonne,
Und alle Sorgen bleiben fern.
O sucht das Gärtlein nicht auf Erden!
Es ist und bleibt uns immer nah'.
Wir dürfen nur wie Kinder werden—
Und sieh, gleich ist das Gärtlein da.

Two Extra Prizes of a Guinea each are offered for the best list of leading authorities (1) for and against compulsory Greek, (2) for and against Mr. Chamberlain's scheme of Fiscal Reform. The names in each list must not exceed twenty.

Initials or a nom de guerre must be adopted by ALL competitors, but the prize-winners will be required to send real names for publication.

Those in the First Class are entitled on application to a copy of "Essays in Translation" or "Prizes and Proximes."

All competitions must reach the Office by February 16th, addressed "Prize Editor," THE JOURNAL OF EDUCATION, 3 Broadway, Ludgate Hill, E.C.

EDUCATIONAL AGENCY. (Established over 70 years.)

Proprietors: Messrs. GRIFFITHS, SMITH, POWELL & SMITH.

Offices—34 Bedford Street, Strand, and 22 Henrietta Street, Covent Garden, London, W.C.

Head Mistresses and Principals of Public and Private Schools desirous of engaging for the **Term commencing after Easter (1905) experienced and well qualified Teachers—Graduates or Undergraduates** of the various Universities, **Trained and Certificated Teachers**, Music, Kindergarten, Foreign, and other Assistant Mistresses, **Senior and Junior**, and who will state their requirements to Messrs. GRIFFITHS, SMITH, POWELL & SMITH, will **at once** be placed in correspondence with **eligible** candidates **free of charge**. To facilitate a **speedy** arrangement, **full details** as to the **essential** qualifications, the salary offered, and whether Resident or Non-resident should be stated.

Head Mistresses and Principals will be at liberty to make use of Messrs. GRIFFITHS, SMITH, POWELL & SMITH's offices for the purpose of interviewing candidates at any time between the hours of 10 and 4 daily.

TELEGRAPHIC ADDRESS: "SCHOLASQUE, LONDON."

Assistant Mistresses seeking Appointments for the Term commencing after Easter (1905) in **Public or in Private Schools** should apply at once to Messrs. GRIFFITHS, SMITH, POWELL & SMITH, who will forthwith furnish them with particulars of vacancies suitable to their requirements. Copies of testimonials should be sent, as also a statement as to qualifications, &c. Please see page 150 for special notice as to immediate and Easter (1905) vacancies.

SCHOOL TRANSFER DEPARTMENT.

Schools Transferred and Valued. Partnerships arranged.

List of Boys' and of Girls' Schools for Sale and Partnerships sent **gratis** to intending purchasers, to whom **no Commission will be charged**. The Transfer Department is under the **direct management** of one of the partners of the firm.

These School and Teachers' Advertisements are continued from page 147.

MONS. BÉTIS, the Introducer of the Gouin Method, is open to Engagement as Non-resident or Visiting **FRENCH MASTER**.—63 Sinclair Road, West Kensington, London.

NORTH GERMAN Protestant LADY, with State Certifications, desires Engagement in School or Family. General subjects: German, French, Music (Pianoforte). Address—Miss F. GRAHN, Hannover-Waldhausen Central-strasse 13.

ART MISTRESS requires Post. Art Master's Certificate (Group I). Drawing, Painting, Design, Brush Work, Plant Drawing, Black-board Monochrome Painting, Antique, Geometry, Perspective, &c. Preparation for the various Drawing Examinations of the Board of Education, Oxford and Cambridge Locals, College of Preceptors. Four years' experience Class Teaching.—Miss KNIGHT, 50 Hospital Street, Nantwich.

NORTH GERMAN LADY, with State Diploma (Professor of Modern Languages, very successful in preparing for the different University Examinations), desires Visiting Post at a first-rate School.—M. B., 146 King Henry's Road, N.W.

POST required as **SECRETARY** to School, Society, or Institution. Good testimonials.—Miss E. J., 1 The Yews, Belvedere, Kent.

YOUNG Swiss Protestant (well educated, speaking French and German) desires Engagement as **TUTOR-COMPANION**. Music, Piano, Violin, Zither, &c. Good references.—J. S., 83 Chester Square, Belgravia, S.W.

ART MISTRESS.—Painting, Drawing, Modelling, Brushwork, Carving. Studied from Life in Paris, Germany, London. Ablett System. South Kensington. Res. or Visiting. Address—Miss P., 16 Blakesley Avenue, Ealing, W.

INCORPORATED ASSOCIATION OF HEAD MASTERS.

THE Annual Meeting took place on January 11 and 12 at the Guildhall. There was an unusually large attendance. The Council Chamber was otherwise occupied, and the Court Room, in which the sittings were held, was inconveniently crowded.

Canon BELL, the outgoing President, introduced his successor, the Rev. JAMES WENT (Leicester), who, in an able introductory address, took a general survey of the progress of secondary education during the past year.

England and Germany.

In a recent speech of the Emperor William at Dantzic the Emperor had attributed the extraordinary development of German industry and commerce to the serious work and systematic teaching, based on the scientific knowledge, of German schools. The difference between the two countries was that Germany had recognized the paramount importance of secondary education and England had not. While elementary education had steadily and rapidly advanced since Mr. Forster's Act of 1870, secondary education had limped languidly in its rear. Buildings and appliances that would not be tolerated in primary schools were considered quite good enough for secondary. To give a case that had come within his personal experience, a building condemned as an elementary school had been opened as a high school and put in competition with a neighbouring grammar school. The Act of 1902 had done something to stir that supineness of the middle classes in looking after the education of their own children which Matthew Arnold deplored, and the merits of the Act would be recognized more and more as time went on. It had made it possible, for the first time in the history of the country, to organize education as a whole and to prevent overlapping.

Social Distinctions.

The backwardness of secondary education was due partly to historical, and still more to social, causes. There were grammar schools planted in villages and places where they were not wanted, while populous centres were without any educational endowments. Under the new Act it would surely be possible for a body of disinterested men to map out a district, and to transplant such schools to places where they were wanted, giving compensation by means of local exhibitions, and establishing additional schools, where needed, from public funds. Social prejudices, too, were slowly being broken down. It was gradually being recognized that "secondary" connoted not a class distinction, but one of attainment. The recognition of this fact was largely due to the free admission in the last thirty years to grammar schools of County Council scholars, boys of ability and character, many of whom had afterwards won the highest honours at the University. The number of such scholars would, he hoped, largely increase in the future.

Pupil-Teachers.

The regulations for the instruction of pupil-teachers which were published in 1903 would also operate in making the expression "secondary school" refer to the character of the education given rather than to the social status of the pupils. The experiment of educating pupil-teachers in secondary schools was an interesting one, and many of the larger Educational Committees were giving it a fair trial. If the plan was not universally adopted, it would be because the Local Committees were disinclined to spend money on training pupil-teachers who, not improbably, when their training was over, would seek employment with some other Authority. No doubt, education, as a whole, would be advanced; but this somewhat abstract advantage would hardly commend itself to the average ratepayer or even to the average alderman. As a matter of principle, it appeared obvious that the cost of the training of pupil-teachers should be defrayed from the national Exchequer, although with a depleted Treasury it was hopeless at present to ask for increased grants. Their hope must be that, if we could keep out of "just and necessary" wars, there might before long be more money available for secondary education generally. He did not conceal the fact that it was possible that they might have some difficulties as the result of this arrangement. A certain number of parents, more especially among those who were a little doubtful about their own position socially, had a fixed idea that the social surroundings of their boys were of more importance than their education, and they might show some unwillingness to send their sons to schools where they would meet with boys of a social grade presumably lower than their own. Their anxiety was without foundation and their pride of position altogether misplaced. The idea that because a boy's parents were in relatively poor circumstances that boy was not fit to associate with sons of successful manufacturers was one which he found it difficult to describe in terms of due moderation.

New Regulations for Secondary Schools.

Without anticipating the debate on this subject he would call attention to two points. He reckoned that in future schools of the A type, which had been earning £5 per head, would in future not earn on the

average more than £3. This was a serious loss. Secondly, the restriction in the matter of examinations to those which comprised the whole school or were held solely for the purpose of awarding scholarships seemed to him unreasonable. They had indeed received an authoritative assurance that when the University Local Examinations were utilized for the school examinations the conditions of the clause would be fulfilled, and in many schools this concession would remove the objection felt to the clause, but not in all, and he regretted that the Board had not seen its way to leave a detail of this kind to the discretion of the head master.

Examination and Inspection.

He believed, as the result of a good deal of experience of various methods, that a combination of the University Local Examinations, or of the examinations of the Joint Board, with an inspection of the whole school by a qualified man sent down by the Universities, and an oral examination, when necessary, of the younger boys, would be found to be the best not only as regarded convenience and efficiency, but also as regarded economy. It was difficult to see why the Board of Education should pointedly ignore the University Local Examinations. So far from ignoring them, they would be well advised to utilize them as part of the machinery for estimating the efficiency of their schools. It was obvious that an inspection by two or three men, however well qualified, spread over two or three days, and held perhaps in May, when the school year had still two months left for revision of the year's work, was a very inadequate way of judging of the work of the school. He did not wish to find fault with the inspections of the Board of Education or to suggest that the schools should not be regularly visited by its inspectors. But it was impossible for any men to judge adequately of the work of a school under the conditions which must of necessity govern their inspection. Inspection was one thing, examination was another. Both had their uses. The inspectors, on their visits during the year, could see not only that the conditions of the Board were being observed, but that the staff was efficient, and that the apparatus and appliances were satisfactory. They could hear and criticize the teaching, they could make valuable suggestions, they could do much in the way of help and encouragement; but from the conditions of the case they could not examine; and he believed that it was quite possible for an inspector, however able and experienced, to form a wrong impression of the work of a master. The tabulated results of the University Local Examinations, or of those of the Joint Board, held at the end of the school year, and the University inspector's report on the school would correct this, and would be a valuable help to the Board of Education inspector in estimating the work of the school and in giving his own report. The scheme he suggested fitted in with the universal feeling to reduce the number of the examinations, and these University examinations, in their wide choice of subjects, gave scope for that varied culture which was expressed in a phrase first used at the Cambridge meeting of the Association, which had since become classical—"freedom, variety, and elasticity." This suggested the question of school or qualifying certificates. Whatever the ultimate decision upon the question might be, he trusted that there would be no hard rule made, but that the Board of Education would accept varying forms of certificates issued by various recognized academic bodies.

On the motion of the PRESIDENT, a vote of thanks was accorded to Canon Bell for his services as President of the Association during the past year.

New Regulations for Secondary Schools.

Dr. W. H. D. ROUSE (Cambridge) proposed the following resolution:—

"That this Association regards the new Regulations for Secondary Schools with satisfaction in general, but regrets that the Board of Education does not provide: (a) for the calculation of grants upon terminal attendance; (b) for the recognition (1) of advanced courses to follow upon, and (2) of preparatory courses to precede, the existing four-year course; (c) for ensuring comparative freedom of curricula to schools satisfying certain tests of a higher liberal education."

The Rev. R. D. SWALLOW (Chigwell) seconded the resolution.

Dr. ROUSE prefaced his criticisms by a full acknowledgment of the steps in advance marked by the new regulations. (1) The principle that Government grants should be given, not on a section of the school's work, but on the whole course. This sound principle must be further extended. (2) The importance given to the study of English. He hoped, however, that undue importance would not be attached to the Board's accompanying flyleaf. The list of books recommended was an absurd one, apparently a reminiscence of the compiler's school days. Publishers, however, took it seriously, as though it was an authoritative code, and were busy getting out editions. (3) There was on page 21 a cautious warning against the wasteful competition of school v. school. He hoped the Board would take practical steps to carry out this warning, and with this end appoint competent and courageous inspectors. (4) The regulations as to examinations seemed to him, a step in the right direction, and herein he ventured to

disagree with the President. He could make no exception in favour of the University Local and Joint Board Examinations. These gigantic examinations, where the candidates were not seen, without any *vis à voce* or connexion with the teacher, were on a thoroughly vicious principle. To pass to criticisms. (a) The grants were assessed by the year, while the unit of their school life was the term. As a practical result thirty boys in his school were debarred from the grant because they came in the second term of the year or left before the end of the year. It would be possible for a boy to have been four complete terms in a school and part of a fifth and yet earn no grant. The Board's objection was that accounts would be complicated. It was the Board that had made them so. As he had before pointed out, three hundred clerks were now engaged in adding up and checking school registers, and some £30,000 a year of public money was wasted on clerical work. (b) The grants were given only to a portion of the school. Hence it was for the money interest of the school to push boys prematurely into the upper part, and to keep them there too long. The scale of remuneration was a complicated one, but he reckoned that it would work out at less than what he had received last year. (c) The conditions of gymnastics, manual training, &c., would press hardly if insisted on. What we wanted was a Minister of Education who would say boldly that the country needed half a million for secondary education, and who was prepared to risk his position in demanding it. The one quality most lacking in our present officials concerned with education was courage.

Mr. T. VARLEY (Winchester) moved a rider protesting against any diminution of grants to schools which had incurred capital expenditure on the strength of the continuation of such grants. He instanced his own school, which was started eight years ago. The governors would never have spent the considerable sums they had except on the faith of the permanence of the grants.

Mr. CRICHTON (Sherborne) seconded the rider. They felt keenly this ridiculous reduction in the grants. The Board, after a full-dress inspection, reported of his school that the staff were underpaid, and suggested that extra funds would be available if pupil-teachers were accepted. Apparently the Board were not aware that the Local Authority paid only half of the teaching cost.

Mr. MANSFORD (Dartford) supported. In the school where he had previously been the governors had made both ends meet by docking the head master's capitation fee by a pound a head. Any further reduction must come out of the salaries of the assistant masters. He complained that the Local Authorities were now spending the whisky money which ought to go to secondary education on the training of pupil-teachers.

Mr. REITH (Halifax) would like to see the general approval of the new Regulations strengthened. The attitude of the North of England at the Liverpool Conference had been wholly misrepresented by the paper of one head master whose flood of sarcasm there had been no time to stem. As to (a) of the Resolution, the remedy was to be found in a general assessment of the school. As to (b), he was sorry to see the demand put forward at all. Their difficulty was, not to get boys to school, but to keep them there. They should proceed along the line of least resistance; directly they demanded grants for elementary classes they would have the N.U.T. down on them. Section 4 of the Regulations seemed to have been drafted by some one who could not conceive of three languages being learned at school. They should press for the abolition of age limits and for the substitution of periods for hours.

Mr. KAYE (Bedford) had found in his own dealings with the Board that they were squeezable. He agreed with the recommendation of the Council (pages 55, 56 of the Report). As to manual training, he was assured by the Board that it might include anything from cardboard cutting to glass blowing.

The resolution was then put *seriatim* and carried with the exception of (b) (1), which was lost. Mr. Varley's rider was likewise carried.

School Certificates.

In the absence of Mr. RUTTY, Mr. SWALLOW moved the following resolution, which had been drafted by the Council:—

(1) "That this Association desires (a) that all University Authorities in England should co-operate in establishing a general system of school certificates; (b) that the Board of Education should appoint a Board of Control for the purpose of correlating the proposals of such Authorities; (c) that there should not be any classification of successful candidates, but that marks of distinction should be given in the several subjects to such pupils as are worthy of special notice; (d) that periodical inspection of a school should form a condition of the grant of certificates to its pupils, and that the report of such inspection should be taken into consideration by the examination for these certificates." (2) "That the Association deprecates the division of the work between, and the system of dual marking by, external and internal examiners; provided always that the examining body takes sufficient measures to recognize the curriculum of the school examined and to set papers suitable thereto."

He commended the scheme of the Joint Oxford and Cambridge Board which had been drawn up by Mr. Gross and Mr. Matheson. The same resolution had been approved, with one exception, by the Essex County Council. The purport of (a) was that they did not desire one Central Board—the University Authorities must co-operate; (b) meant that the Board of Control should not be a department of the Board of Education, nor an individual, though they would be well satisfied if the business was left in Dr. Scott's hands. It should represent the Board of Education, the Universities, and the Local Authorities. As to (c) there was a danger that first classes would be exploited to advertise schools and to continue the unwholesome competition that now existed. On the other hand, in order to keep up the standard in different subjects, there must be distinctions in these subjects. The object of (d) was to balk the crammer. There was a danger that boys would be removed from school a month or two before the end of their course to gentlemen who would undertake to ensure for them a certificate. The second part of the resolution was directed against that part of the Board of Education scheme which was obviously the work of theorists and with which he was sure that a practical teacher like Dr. Scott did not agree. To compare and correlate two sets of marks was a hopeless task. Unless the awards were made simply and solely by the external examiner they would not command the confidence of the public generally or of the Local Authorities.

Mr. EASTERBROOK (Islington) formally seconded.

The Rev. H. A. DALTON (Felsted) moved an amendment to (c) that all the words as far as "but," inclusive, be omitted, and there be substituted: "That there should be a division of successful candidates with a first and second class and." They desired an abolition of the professional examinations, but these bodies would require some a higher and some a lower standard. The same held good of business employers. He did not himself see why schools should not advertise their successes, but this argument held even more strongly in the case of the proposed distinction. Again, if a boy had already obtained a Second Class, there would be an inducement to him to stay a year more at school to obtain a First Class. He had a boy in his school who had thus gained four (he was not sure whether it was not five) Oxford and Cambridge certificates.

Mr. HEAP (Rotherham) seconded the amendment.

Mr. WELLS (Battersea) took exception to Part 2 as failing to convey their approval of the closer association between teachers and examiners. He was not prepared to oppose it, for he acknowledged that at present there might be difficulties in the way of teachers and examiners setting and marking papers in concert. He hoped the time would come when teachers might be trusted both to set papers and to mark them. It was hardly fair to stigmatize as ignorant theorists the Consultative Committee, which included the names of Dr. Gow, Canon Lyttelton, Mrs. Sidgwick, and Mrs. Bryant. He would move as an amendment:—"That the Association approves the closer co-operation of the teacher and external examiner, but does not consider the dual system of setting and marking papers desirable."

Mr. JENKYN THOMAS (Aberdare) seconded.

Mr. MATHESON, who was invited to address the meeting, stated that the inspection intended in the proposals was either that of the Board of Education or of the Joint Oxford and Cambridge Board, and it was possible that a third inspection—that of the Local Delegates and Syndicate—might be accepted. As to the meaning of "periodic inspection," there was no authoritative definition, but the Board of Education inspection was triennial. He pointed out that Mr. Wells's scheme implied separate sets of papers for each school, and a consequent large increase of expense.

The resolution was then put. Mr. Dalton's amendment was carried by 40 votes to 37, and Mr. Wells's amendment was lost by 32 to 39 votes.

Tenure Conference.

At the afternoon sitting, after the reports of Committees had been received, Canon BELL moved:

"That the recommendations 4 to 7 (Report of Council, pages 73-75) be adopted."

The Tenure Conference recommended that for each school a salaries scheme should, with the approval of the governing body, be adopted, to include (1) (a) provision for annual or other periodic increases of assistant masters' salaries, such increases to be automatic, but each rise to require the assent in writing of the head master; (b) power for the head master to recommend further increase of salaries. (2) A pension scheme for assistant masters in public secondary schools. (3) A form of agreement whereby notice to terminate an assistant master's appointment should take effect at the end of term only, and must be given within seven days from the beginning of the term. It was also pronounced as highly desirable that the minimum commencing salary of an assistant master registered in Column B should be £150 a year, non-resident.

In the discussion which followed, complaint was made that the Association of Assistant Masters had broken faith in not accepting the joint resolutions *en bloc*, and amending them by striking out the words

"automatic increase" and taking away the control of the head master in the matter. It was answered that this action should not prejudice the vote of the Head Masters in sanctioning the original joint resolutions, and Canon Bell's motion was carried with the rider that the Council be instructed to consider what further action could be taken.

Federation of Educational Associations.

Canon BELL, in moving

"That this Association gives its general approval to the Draft Charter of the proposed College, and empowers the Council to negotiate with the College of Preceptors, the result of such negotiation to be referred to a Special General Meeting,"

regretted that an embargo had been laid by the Board of Education on Dr. Scott, which prevented him from moving the Resolution. He stated that the College of Preceptors had already drafted a provisional Charter, which was now in the hands of two eminent counsel to give their opinion whether it was or could be made an amending Charter, as there were serious difficulties in the way of obtaining a new Charter. He pointed out the advantages of a Federation which would enable secondary teachers to speak with one voice and make that one voice heard both with the Board of Education and with Local Authorities, whose action in many places was bearing hardly on existing secondary schools. It would form a useful clearing house for educational ideas. An amendment was carried substituting a vote by paper for a Special General Meeting.

Reconstitution of Council.

The changes proposed by the Council were accepted, but the proposal that the London Division should return three members against the two members of the other division was, on the motion of Mr. Reith, rejected by a narrow majority.

SECOND DAY.

Before the proceedings opened a service was held at St. Lawrence Jewry. The preacher was Canon Bell. The attendance, though larger than last year, was limited. The morning was mainly occupied by a discussion of the Greek question. That no fresh arguments were adduced on either side is no reflection on the orators of the Association, but an excuse for our brief summary of the debate.

The Rev. R. D. SWALLOW (Chigwell) moved the following resolutions:—

1. "That in the opinion of this Association it is desirable that the Universities should institute a twofold entrance examination: (a) for candidates proceeding to degrees in arts, in general as at present, but with a higher standard in literary subjects; (b) for candidates proceeding to degrees in mathematics and science, with a modern language substituted for Greek."

2. "That the provision for papers in English and history, and for the omission of Paley's 'Evidences' from the Cambridge Previous Examination as laid down in the first report of the Cambridge Studies Syndicate, should be insisted upon in examinations under both (a) and (b) above."

3. "That a new degree in mathematics and in science should be instituted, differing in title from the degree in arts, but of precisely the same University standing."

The Association had gradually come to the conclusion that there should be some relaxation of conditions for admission to the University of candidates who could prove themselves worthy of high honours in mathematics or in science. Very few of them, in his opinion, felt any resistance to the compulsory study of a language which had a peculiar fascination for the scientific mind. On the other hand, a number of such candidates came from schools which offered no opportunities for learning Greek, and for them there should be some alternative. The *causa causans* of the Syndicate's Report was, he believed, the conditional offer of a millionaire, and the University was bound in honour to reject such a bribe. If the decision rested with resident members, he would be willing not to interfere, but it would be largely determined by outside voters, imperfectly informed, country parsons and lawyers. If the Report were passed by the Senate, in a quarter of a century Greek would have become as much a luxury of the few as Hebrew was to-day.

Mr. C. W. KAYE formally seconded.

Mr. BLEATER (Warminster) moved an amendment, virtually a negative of the resolution, approving the Report of the Syndicate. He held that the entrance to the Universities should be through the single gate of a liberal education. The resolution seemed to him to have been framed with the object of detaching the most determined opponents of compulsory Greek by granting them a *privilegium*.

Mr. CARTER (Whitechapel) seconded the amendment.

The Rev. J. A. NAIRN (Merchant Taylors') proposed another amendment, with the object of making the issue clearer and declaring that the Association insisted on Greek for pass men.

The Rev. A. F. RUTTY brought forward another amendment, deprecating the substitution of a modern language for Greek, whether for honour or pass men. Let them wait to see what the effect of modern education was before taking any action.

Dr. FLECKER moved an amendment making Greek compulsory for all honour men, but allowing the substitute for pass men.

Mr. DALTON suggested that part (1) (b) of the resolution should read: "A modern language, including translation at sight, composition, and an oral test, as an alternative for Greek."

Mr. SWALLOW accepted the alteration.

Prebendary MOSS, at the invitation of the President, repeated his Horsham speech to the Head Masters' Conference.

The amendments were then put and lost, and Mr. Swallow's resolutions, with the one alteration suggested by Mr. Dalton, were carried.

Education of intending Pupil-Teachers.

Some discussion took place on resolutions dealing with the education of intending pupil-teachers, and eventually they were adopted as follows:—

"That this Association cordially approves of the proposal of the Board of Education that candidates for pupil-teacherships in public elementary schools should receive a substantial portion of their education in a public secondary school."

"That this Association further considers it desirable that as many recruits as possible for pupil-teacherships in public elementary schools should be obtained from the ranks of ordinary pupils of endowed secondary schools."

"That, in order to effect the latter purpose, the salaries of assistant teachers in elementary schools should be considerably increased."

A discussion, opened by Mr. MONTAGUE JONES, took place on "The Teaching of Geometry," and, after a vote of thanks had been passed to the President, the proceedings terminated.

MODERN LANGUAGE ASSOCIATION. ANNUAL GENERAL MEETING.

THE Association held its Annual General Meeting at University College, Manchester, on January 12 and 13. The chair was taken by the President, Prof. SADLER.

The VICE-CHANCELLOR OF VICTORIA UNIVERSITY attended to welcome the Society. Universities, both the older and younger, were recognizing more and more the important place of modern languages. The philological side was sufficiently cared for, but he wished to emphasize the even greater importance of the literary side. Whether the subject studied was Latin or Greek or French, it behoved teachers to call up literary enthusiasm, and to make their pupils realize that a study of the form was an introduction to an appreciation of the thought and literary expression. In the newly formed Faculty of Commerce the study of modern languages was an essential part of the students' work. Even here, in what had been irreverently called "commercial slang," clearness of thought and accuracy of expression were essential. Things had moved since his own school days, when he was taught French from a document whose numerous rules and more numerous exceptions rivalled the intricacy of any Code issued from the Education Department.

The Vice-Chancellor then retired and the annual report was read by the Secretary, Dr. EDWARDS. During 1904, 100 new members had joined, bringing the total number up to 547. A sub-committee, with Dr. Heath as Chairman, had been appointed to consider the future conduct of the *Modern Language Quarterly*. In accordance with their report arrangements were nearly concluded for the publication of a monthly bulletin dealing with the practical side of modern language teaching to be edited by Prof. Rippmann, and of a quarterly magazine of academic character with Prof. Robertson as editor. Mr. Warren, President of Magdalen College, Oxford, was announced as President for 1905. Arrangements had been made for entertaining the Professors of Living Languages and the International Guild on a return visit to London this Easter, and the Vice-Rector of the Academy of Paris, M. Liard, had promised to attend.

The Hon. Treasurer, Mr. PAYEN-PAYNE, apologized for the absence of a balance sheet, which was not yet ready. The Society were still about £30 to the bad; a debt on the *Quarterly* of £75 was gradually being wiped off. Of the half-guinea subscription 5s. 6d. had to be written off for publications.

Mr. STORR moved that the Secretary's report be received and adopted. He considered the small debt the sign of a young and vigorous institution which believed in its future. He congratulated the Association on securing the services of two such capable editors.

The PRESIDENT then delivered his address, which we are compelled to omit. It has been pretty fully reported in the daily press, and it would be impossible in a *résumé* to do justice to the closely reasoned philosophic argument.

Compulsory Greek.

Mr. MILNER-BARRY moved:

"That this meeting of the Modern Language Association welcomes the Report of the Cambridge Examinations and Studies Syndicate, and pledges itself to make every effort to further the carrying out of this Report."

Four years ago, when the Association met at Liverpool, he had moved and carried unanimously a similar resolution asking that in University entrance examinations a modern language should be allowed as an alternative to a classical language. He explained in detail the changes proposed by the Syndicate. The contention of modern language teachers was that, with the greatest respect for the humanities, on which most of them had been trained, they could not agree that both Latin and Greek were an essential condition for entering a University. In other words, they pleaded that French or German, if properly taught, was an adequate substitute for the amount of Greek required for the Previous Examination. The change would not, he believed, impair the study of Greek in the larger public schools, but in the smaller grammar schools, which by their constitution or circumstances were debarred from taking Greek, it would give a dignity and importance to the study of modern languages to which they were fully entitled. His own experience as a schoolmaster did not bear out Dr. James's contention that all the able boys were to be found on the classical side. The question was one that ought to be settled by the Universities and the secondary teachers, not by "eight bishops, five peers, and four archdeacons." The Master of Emmanuel College had addressed his questions only to Conference Head Masters. Had he inquired of the Incorporated Head Masters or Assistant Masters, the answers would have been very different.

Mr. BYRNE (Eton) seconded the motion. He bore witness to the evil effects at Eton of the multiplicity of subjects taught. Latin and Greek still formed the backbone of the studies, but, from the pressure of public opinion, modern subjects had one by one been superadded. The result was distraction and confusion on the part of the unfortunate victims. No less marked was the revival of interest in the work on the part of boys who had been allowed to drop certain subjects, such as Greek. As to the effect of Greek on small boys, he knew that at present in the preparatory schools Greek was a sort of terror. A boy who was at all muddle-headed or slow, though by no means stupid, was crammed with Greek for his last six months, and he came to Eton with his mind in a state of confusion which he did not shake off for years.

Prof. FIEDLER said it was quite clear that the resolution implied no attack on Greek as a University subject of study; otherwise he could not support it. At Birmingham he and others were doing all in their power to establish a Chair of Greek. He thought the argument that the Greek language was the finest instrument of expression that the human mind had invented was fallacious. He believed in development, and in the survival of the fittest, and that therefore modern languages, *qua* languages, were superior to Greek. He had been learning English for twenty years, and still found new beauties, and, alas! new difficulties in the language. There was a confusion between the Greek language and Greek literature. Greek lacked the discipline and mental training of a spoken language. The conservatives who were now fighting for compulsory Greek would, if they had lived in the fifteenth or sixteenth century, been equally strong against the introduction of Greek at schools and Universities.

Mr. SOMERVILLE (Eton) said the resolution was really a rider to the President's address, which was a plea for liberty in learning, and for a larger measure of humanity in the education of the country. A former colleague of his (Mr. Arthur Benson) had justly said that the true principle of education was to discover aptitudes, and to encourage them. From neglect of this principle there was at the present time enormous waste. Boys from the age of eight to nine were made to specialize in two dead languages, and to them they had to devote twenty-five hours a week for ten years of their lives. The result was in most cases an imperfect grasp of the Latin and Greek in which they had been unwillingly drilled, and a loss of intellectual interest in all other subjects.

Miss POPE (Somerville College) said the question had so far been discussed only from the point of view of boys' schools. In girls' schools Greek was begun at a much later age. She herself looked back on the year during which she had studied Greek under the pressure of a University examination as one of the most profitable in scholastic education.

Mr. STORR said he had during the last month been an auditor at four conferences where this question had been discussed, and could not withstand the temptation of at last riposting, though, it seemed, he was as preaching to the converted. There could be no doubt that under the present system a vast amount of time was wasted by boys on Latin and Greek. Mr. Arthur Sidgwick, who had had large experience, told

him that he found his women students in classics at Oxford slightly, but only slightly, inferior to the men—as good in translation, but not so good in composition; yet he was within the mark in reckoning that the men had at school spent five hours on classics for every one of their sisters. His friend Dr. James had pointed to the decay of Greek in preparatory schools as a sign of the times, and the beginning of the end. Could any one with a tincture of pedagogics uphold the *ancien régime* under which a child of eleven or twelve was forced to learn simultaneously three foreign languages, to the neglect of his native tongue, which was generally ignored in the discussion? Mr. Lyttelton had laid down that no one who had not taught the “Phaëdo” to a sixth form and the “Anabasis” to a fourth form had a right to pronounce an opinion. He wondered how many of the Conference Head Masters could satisfy a similar test as to French and German. Had they tried to teach French prose, or to write it themselves, they would not talk so glibly of soft options. If it were the rule not to begin Greek before fifteen, he was convinced that the study of Greek would not suffer one whit, and the gain to other subjects would be incalculable.

The motion was then put, and carried with one dissentient.

After a short interval for tea, a paper was read by Prof. Robertson on “Schiller after a Century.” We understand that the paper will be incorporated in a forthcoming monograph on Schiller.

In the evening the Association dined at the Midland Hotel. The chair was taken by Prof. Sadler, who proposed the toast of the evening, which was responded to by Mr. Somerville. “The University of Manchester” was proposed by Mr. Headlam, and in the regrettable absence of Principal Hopkinson, owing to domestic illness, was responded to by Prof. Dixon. Mr. Storr proposed “Guests and Absent Members,” and Prof. Tout replied.

SECOND MEETING.

French Literature.

The proceedings were resumed at 10 a.m. on the Friday with a French conference by M. Barlet.

M. BARLET said the subject entrusted to him by the Committee was “The Teaching of French Literature in English Schools.” He should prefer to amend his brief, and discuss “How a Taste for French Literature can be inspired in Class Teaching.” So vast and complex a subject could not be included in the time-tables or be intercalated between an hour of chemistry and an hour of drawing. It needed a separate class—something between a lecture and a conversation—not a formal lesson. It was obvious that a study of literature presupposed a basis of linguistic knowledge, and therefore could not be profitably begun before the third class from the top of the school. In the fourth form he desiderated an extra hour a week. He had found by experience that by reading and talking a French teacher could create, even at this age, a general interest in French literature. In the fifth form he would have two hours taken from the regular French lessons—one for reading and one in alternate weeks for conversation and composition. In the sixth form four of the five hours allotted to French should be devoted to literature, the remaining hour being employed in keeping up a knowledge of grammar. Two of the four should be given to reading, one to grammar, and one to composition. As to the books to be read, he would abjure all histories of literature—confine himself to plain texts, not, however, rejecting extracts of sufficient length. In the fourth form he should disregard dates, and take what was most likely to interest pupils at this age. He recommended the mediæval epics in a modernized form. In the fifth he would confine himself to seventeenth-century writers, with occasional excursions into the eighteenth century. In the sixth he would treat mainly of the nineteenth century, though this study would compel constant references to earlier centuries. At the present time, when classical studies are on the downward grade, it is all-important that modern language teachers should show that they can provide an equivalent, an instrument not only of instruction, but of education. This instrument was only to be found in an intelligent study of modern literature.

The PRESIDENT, thanking M. Barlet for his delightful paper, remarked that it was appropriate that it should have been read at Manchester. The plan of bringing the study of modern history and modern literature into secondary schools had, as far as England was concerned, its origin in the near neighbourhood. In 1761 Joseph Priestley was tutor in *belles-lettres* at the Warrington Academy, afterwards moved to Manchester, and now represented by Manchester College, Oxford. He there developed a course of modern humane studies for senior boys; so that the first dawn of the ideas that M. Barlet had been developing began not many miles from the hall where they were sitting. Moreover, he believed that Priestley got his inspiration from France, where the study of modern literature began in the great period of the seventeenth century. Another point that the paper had suggested to him was in the present conflict of studies there was a danger of not giving enough time and leisure to boys of promise at the top of the school. In all education there should be a group of studies for training in accuracy and thoroughness, and another group to encourage

creative power; but besides these two groups they needed, far more than they had in England, what he might call outlook subjects, to expand the pupils' horizon, and one of those would, of course, be the study of literature, treated in the spirit which M. Barlet had so admirably described.

Mr. HUGH remarked that French literature could be but imperfectly appreciated unless correct pronunciation was enforced from the beginning.

Mr. N. KOLP said that the method M. Barlet advocated was virtually in force at the school which he attended sixty years ago at Frankfurt-am-Main. He believed in English teachers for French, but they must first qualify themselves by residence abroad. He had himself in a humble way assisted teachers to take foreign courses by paying their expenses, and he hoped that rich Manchester merchants would follow his example.

Miss MATTHEWS emphasized the importance of school libraries. Every school should have a good foreign library and duplicate copies of familiar books of reference. She had herself observed in a French school the stimulus that such a library gave to the study of English literature.

Mr. STORR said that the study of literature in schools was greatly hampered by examinations. Literature was one of the best subjects to teach and the worst to examine in. And our English examinations were in this respect the worst in the world, conducted wholly by external examiners and without a *viva voce* test. At the same time, he could not pronounce teachers wholly blameless in the matter. He was a sincere adherent of the New Method, but its tenacity had undoubtedly been to oust standard authors from schools and to restrict the reading even of the highest forms to second-rate modern novels or plays. He was glad to observe a reaction in favour of plain texts. The Bibliothèque Nationale and the Allgemeine Bibliothek would provide a pupil for a few shillings with the masterpieces of French and German literature.

Times and Seasons in Modern Language Teaching.

Mr. M. P. ANDREWS (Bolton Grammar School) contributed a paper on “Some Considerations of Time in Modern Language Teaching.” The earliest advisable age for beginning a foreign language was ten; in his opinion eleven was preferable. If there was a general agreement to begin at eleven, and scholars from the elementary schools entered at that age or later, the chief difficulty of the modern language teacher would vanish. Under present conditions the only solution, in schools receiving such scholars, was a temporary form for a term in which the bulk of the teaching was linguistic. For many reasons the first foreign language taught must be a modern language—French and German are psychologically nearer a child than Latin and Greek. They must be taught conversationally, and pronunciation is more easily mastered when the vocal organs are plastic. More can be got out of them by pupils who will proceed only a little way. Should the first language be French or German? From historical causes French has hitherto prevailed in English schools, but, for his part, he thought German had higher claims. German was a more fully inflected language than French, and, if only one foreign tongue were learnt, it were well to choose one that offered a strong contrast to the native tongue. As such it gave a training in accuracy akin to Latin. The pronunciation and intonation were more akin to English, and the spelling was more phonetic, than French. When should the second foreign language be begun? At an interval of two years, when Latin might be begun. After another two years a choice should be made between French and Greek—i.e., between the modern and classical side. At what stage in the learning of a language are most school-hours necessary? Undoubtedly, in the initial stage; for at this stage, under the New Method, no home-work is possible. There should be a phonetic preparatory course. His experience at Frankfurt and in his own school proved to him that this, in the end, was a saving of time. Translation from the outset should be avoided. Much depended on the arrangement of a class both as a whole and as regards individuals. All should command a good front view of the teacher's mouth—i.e., the class should be arranged in the form of a cone, with the apex nearest the teacher. Duffers should be separated by good boys, who will be able to act as monitors and give the correct pronunciation. Marking and place-taking involve waste of time and loss of teaching energy. There should be blackboard space not only for the master, but for the class. Boys should be called upon to correct their own mistakes. This may be done by calling on one pupil to write out his home exercises on the blackboard. The time now taken by a master in corrections should be devoted to preparation of lessons. The greatest weakness of English teaching is “rush,” and the most useful lesson taught us by the Mosely Report is leisureliness in the class-room.

Prof. Sadler having retired, the chair was taken by Mr. STORR. He regretted that time did not allow any discussion of the many points raised by Mr. Andrews's masterly paper, giving the ripe experience of a teacher. He hoped the paper, when printed in the journal of the Association, would appeal to a larger audience, and be fully discussed, in particular that attention would be called to the monstrous hours imposed on teachers who worked the New Method.

Mr. HEADLAM gave a short address on "The Teaching of English." The CHAIRMAN again regretted that there was no time to discuss the paper of one who, both by precept and by example, had shown English ought to be learned.

Mr. H. J. CHAYTOR (Crosby) read a paper on "The Teaching of Philology."

Schiller.

Prof. J. G. ROBERTSON (University of London) gave an address on "Schiller after a Century," a subject suggested by the approaching centenary of Schiller's death. The main question which students of Schiller have to face to-day is: What position did he occupy in the evolution of German and European literature? As a poet of the *Sturm und Drang*, he was the leading poet of his time; dramas like "Die Räuber," "Fiesco," and "Kabale und Liebe" showed him to be a playwright of extraordinary promise. But with "Don Carlos" he gave up the attempt to create a national tragedy on the Germanic lines laid down by Shakespeare, and reverted to the French type of tragedy. For this change the year which Schiller spent as "theatre poet" in Mannheim was largely responsible; he was also influenced by the example of Lessing in his "Nathan der Weise" and of Götter in his "Merope," as well as by the advice of Wieland, who had just published his "Letters to a Young Poet." The remainder of Schiller's career as a dramatist might be summed up by saying it was an attempt to retrieve the step he had taken with "Don Carlos"; to create a German classic drama, which should avoid the errors of the French *tragédie classique*. In the history of the drama, he is thus to be regarded less as a peculiarly national German poet than as the last of the masters of the type of tragedy which originated at the Renaissance. As a philosopher, Schiller belonged to the past rather than to the future; in his attitude towards Kant he attempted to reconcile that thinker's ideas on aesthetics and ethics with the standpoint of the pre-Kantian philosophy. Compared with a contemporary like Herder, Schiller was essentially retrospective; he had the typical rationalistic mind of the eighteenth century. Thus, both as a thinker and as a poet, he is to be classed with men like Pope and Johnson, Lessing and Voltaire, rather than to be regarded as a national poet expressing the spiritual needs of modern Germany.

The proceedings terminated with a vote of thanks to Prof. Sadler, both for his address and his able presidency in the chair.

In the afternoon a visit was paid to the Rylands Library. The chief treasures were exhibited and explained by the librarian.

INCORPORATED ASSOCIATION OF ASSISTANT MASTERS.

THE Association held its Annual General Meeting at the Mercers' School, Holborn, on January 4.

Mr. G. E. S. COXHEAD, of the Liverpool Institute, the President for 1905, took the chair. He congratulated the Association on the rapid progress made since its foundation in 1891. The main charges brought against it were, from the inside, that it was infected with the spirit of trade-unionism, and, from the outside, its sectional character. The first charge was not true, and, in reply to the second, he urged that sectionality need not mean exclusiveness. The chief feature of the past year had been the increase of local Universities—Birmingham, Liverpool, Leeds. He regarded this movement as a solid gain to education. The weak point that must be remedied was that at present students were admitted so young or ill prepared that they were unable to profit by their first year at the University. He advocated informal conferences between the Universities and Local Authorities on curricula, standards, &c. Similar conferences should be held between the Association and elementary teachers. There was no question of coquetting with the N.U.T. What he desired was to promote the realization among all sections of teachers that they were members of a common profession.

Mr. G. F. DANIELL, the outgoing President, then presented the annual report for 1904. The past year had shown steady progress in all directions. In finance there had been a reduction of office expenditure, and henceforward the legal fund, which now stood at £250, would increase automatically. The Joint Conference with the I.A.H.M. had been renewed, and, if the questions of tenure and salaries were still pending, the fault did not lie with the Head Masters. The Board of Education was apparently still blind to the gravity of the position. As a leader in the *Morning Post* put it, "unless the Board of Education can raise the pay of the teachers, at any rate in secondary schools, the national system of education will collapse for want of men to work it." The Leeds meeting was of good augury for the co-operation of the Centre and the Branches. He hoped that henceforth there would always be at least one Council and General Meeting held every year in that tonic air of the North, which they Londoners were so glad to inhale. The Regulations of the Board of Education for

Secondary Schools must commend themselves as a whole to all earnest and experienced teachers. For his own part he believed it possible to have a great organization of higher education without destroying the individuality of the teacher or of the school. None the less, there was a danger of petty and injudicious interference, and the germs of departmentalism were being disseminated in those secondary schools. They must be combated in the earliest stage. The Regulations for the training of Pupil Teachers filled him with an admiration tempered by a haunting fear. His fear was that when the Board's requirements had been satisfied they would have the buildings and the pupils, but no money left to remunerate properly a good teaching staff. In this direction there was work for the Association to do. Believing that in England work is done best where there is public control, he welcomed the Education Act of 1902. For the first time the citizen was to have *qua* citizen some voice in higher education. Responsibility would beget interest, and interest knowledge; and, after some preliminary mistakes, we should find a greatly improved state of affairs as regards higher education.

Mr. COXHEAD moved from the chair a vote of thanks to Mr. Daniell for his services during the past year.

In the absence of the Treasurer, Mr. PETERSON presented the statement of accounts.

Control of Endowed Schools.

The following resolution, which appeared in Mr. Humberstone's name, was moved by Mr. CHOLMELEY:

"That, in the opinion of this Association, any endowed school, for which the Local Education Authority, acting through an Education Committee constituted in accordance with the provisions of the Education Act of 1902, provides, or is prepared to provide, a large proportion of the money required for the maintenance of the school, should be controlled in the manner which appears most desirable to the Local Education Authority; and, further, that the Board of Education should not oppose, in such a case, the abolition of the existing governing body, if the Local Education Authority is in favour of such abolition."

It was not logical that one body should find the money and another body govern the schools. Burnley School was a crucial instance. The endowment was £230, and the Town Council had recently contributed at the rate of £1,100 a year. Yet the Board of Education had adopted the view of the Head Masters (the Assistant Masters had not been consulted) that the governors of secondary schools should be independent bodies—a view that the Burnley Town Council could not accept—and the consequence was a deadlock. In favour of this view the pious founder was called in. Independent governing bodies, they were told, attracted endowments. He thought the pious founder was a snare in so far as he left the public in ignorance of what education really cost. Independent governing bodies gave us, indeed, variety, but they never improved. Unless we trusted our elected Councils, we were committing ourselves to a policy of despair. Governing bodies took cognizance of the existence of head masters, they actually saw them periodically in the flesh; but the assistant master—they could not even visualize him.

Mr. HALE seconded.

Mr. BRIDGE, speaking from his own experience, said that Town Councillors were not fitted, as a rule, to direct the activities of a secondary school. At the same time (as Euclid would phrase it) there could not be in the same town, and on the same side of it, two schools—the one controlled, and the other not controlled, by the Local Authority. The non-controlled school would be starved out. Co-option, as authorized by the Act of 1902, provided the solution. He would move, as an amendment, to add "and provided that both on the Local Authority and on the committee of management of each endowed school there is adequate representation both of secondary and of University education."

Mr. NORWOOD (Leeds) seconded the amendment.

Mr. PAGE (Charterhouse) supported. Mr. Cholmeley was wrong in his facts. In the draft scheme for Burnley School ten of the governors were to be appointed by the Town Council, and only five by other bodies.

Board of Education Regulations for Secondary Schools.

The Rev. J. F. TRISTRAM moved, and Mr. ROWE seconded, the resolution:

"That this meeting regrets that, under the new Regulations of the Board of Education for Secondary Schools, the average grant has not been increased so as at least to equal the average grant payable under the former regulations for Division A schools, and desires to call serious attention to the omission from the new regulations of the statement in the superseded regulations which recognized the authority of the official Register of Teachers."

The resolution was carried.

Vacancies.

Mr. J. V. SAUNDERS moved:

"That this Association protests against the system by which assistant masters are compelled to resort to agencies in order to obtain appointments."

All vacancies in endowed schools ought to be advertised in the public press. The present system was a heavy tax on masters. No agency that was efficient could be cheap.

An objection that the Association was pledged to the Joint Agency was met by the suggestion that the pledge should be at once withdrawn. The resolution was carried.

Retiring Allowances.

Mr. BRIDGE proposed :

"That this meeting desires to record its dissatisfaction with the decision of the Board of Education not to allow the governors of the Whitgift Grammar School, Croydon, to make any retiring allowance to the Rev. George H. Huddleston on his being requested to resign after thirty-one years' satisfactory service as an assistant master in the school, beyond a payment equivalent to one term's salary, as a *solatium*."

He said that at present the sole guarantee of efficiency in schools was the autocracy of the head master. In the present case a new head master comes on the scene, and discovers that twelve of his staff must go. But the retiring head master is awarded a pension of £400, while the retiring assistant master, after an equal period of service, gets a miserable *solatium* of one term's salary. The real remedy was increased attractiveness of employment, not to devise means by a gigantic scholarship scheme for enticing the unwary into the profession.

Mr. CORNER traversed the facts as stated in the resolution at considerable length, and in particular pointed out that Mr. Huddleston had been presented by the visitor of the school with a good living.

Federation of Associations of Secondary Teachers.

Mr. DANIELL moved :—

"That this meeting approves of the proposed formation of a Federation of Associations of Secondary Teachers: provided (a) that each association may retain its individual organization, and provided (b) that this Association has adequate representation on the Council of the Federation."

He briefly rehearsed the steps that had been so far taken to bring about the Federation. Each of the constituent bodies was to have a right to equal representation. Among other advantages, the common journal of the corporate body would enable them to give a wider expression to their views. A new Charter had been drafted, and it was hoped that the details of the scheme would shortly be laid before members in their *Circular*.

Mr. ABEL wished that the word "secondary" might be omitted. He wished to see joint action on the part of all grades of teachers.

Mr. PAGE welcomed the resolution as promising to give to the Association the weight that it deserved, and also as bringing into touch head and assistant masters.

After an adjournment for luncheon, Dr. ROUSE, the late Secretary of the Association, read (by invitation) an amusing paper, which we summarize elsewhere.

Compulsory Greek.

The following resolution was proposed by Mr. SOMERVILLE (Eton) :—

"That this meeting welcomes the Report of the Cambridge University Syndicate on Studies and Examinations, especially the recommendation that candidates should be permitted to take one or two modern languages in place of a classical language."

The signatories of the Syndicate's report included the best known supporters of classical learning. It was the true friends of Greek who, were the innovators, not scientists or utilitarians. The present system of teaching Greek in schools was confessedly a failure. Boys from eight or nine to eighteen or nineteen devoted for ten years twenty-five hours a week to the study of Latin and Greek—and with what results! A distinguished foreigner residing in England had said to him: "I am going to send my boy to Eton to teach him to be a gentleman, but when he is eighteen I shall send him to Germany to be educated."

Mr. CHOLMELEY (St. Paul's) seconded, Mr. DANIEL and Mr. STORR supported, and Mr. WELLS (Merchant Taylors') opposed, the motion.

The motion was carried by 49 votes to 13.

After a short discussion on the Board of Education's memorandum on the teaching of English, introduced by Mr. CHOLMELEY, the meeting adjourned to dine at the Holborn Restaurant.

I.A.A.M. COUNCIL MEETING.

Our January Council meeting was unusually well attended. Over seventy members were present, and every one of our twenty-six Branches was represented. The yearly statement of accounts showed a substantial balance on the right side, a result largely due to the careful administration of the Association's finances by Mr. Fred Charles, who has retired from the Treasurership after having held it

for three years. Mr. Charles's services were acknowledged in a suitable resolution. Mr. W. E. Paterson, of Mercers' School, is his successor; Mr. G. E. S. Coxhead, of the Liverpool Institute, is Chairman; and Mr. G. S. Bridge Honorary Secretary.

It was decided to form a benevolent fund for the benefit of members of the Association, and an appeal will shortly be made for funds.

A curious error regarding the composition of the membership of the Association crept into the report of the Cambridge University Syndicate. It must have surprised many of our members to read that "it was incidentally stated [*i.e.* after the meeting between our representatives and the Syndicate] that 98 per cent. of the members of the Association belonged to the smaller schools in which Greek forms no part of the regular curriculum." As the statement has been quoted in one of the letters in the *Times* correspondence and elsewhere, it may be as well to say that 28 per cent. of our members are attached to schools connected with the Head Masters' Conference, which represent pretty accurately those in which Greek is still taught as part of the regular curriculum.

A social meeting was held at the "Bedford Head" on Thursday, January 19, when Prof. Gregory Foster gave us a most interesting *causerie* on the "accrediting system" in the United States. We are sure these meetings only want to be better known to be more appreciated. They are not confined to members of the Association—any persons interested in the topics arranged for discussion will be welcomed. There will be two more this term—on Thursday, February 16, and Thursday, March 16, respectively.

INCORPORATED ASSOCIATION OF ASSISTANT MISTRESSES IN PUBLIC SECONDARY SCHOOLS.

THE Association of Assistant Mistresses in Public Secondary Schools held its twenty-first Annual Meeting at University Hall, Gordon Square, on Saturday, January 14, the President, Miss LAURIE, being in the chair. In her opening address she spoke of the increasing numbers and widening activities of the Association. She reported that during the year the Committee had sent up memorials to the Secretary for Scotland on the Education (Scotland) Bill; to the Board of Education on the Regulations for Secondary Schools, and on the Consultative Committee's proposals for a system of school certificates; and to the Chairman of the London County Council, requesting that two at least of the women co-opted to serve on its Education Committee might be directly cognizant of the present conditions of the higher secondary education of girls. The Committee had also drawn up a salary scheme and draft form of agreement for assistant mistresses, which would be brought before the meeting for discussion.

The Secretary, Miss MACKLIN, then gave some account of the considerations on which the salary scheme had been based. The Committee had obtained, through the kindness of the Head Mistresses, particulars of the salaries now being given in some twenty endowed schools of the high-school type. It was now recognized on all hands that without endowment or aid from public funds adequate salaries could not be given. Elementary teachers, so much better organized than secondary, had succeeded in establishing, for elementary schools, the principles of security of tenure and a fixed annual augmentation of salary; and elementary salaries were improving. These influences were reacting on the schools established by Local and Municipal Authorities for higher elementary, technical, and secondary education. The Association of Head Mistresses had just published a circular recommending a higher scale of salaries than had hitherto usually obtained. Mr. Sadler's Liverpool report contained similar recommendations. The Committee's scheme followed closely on the lines of those put forward by the Head Mistresses and Mr. Sadler.

After careful discussion and some emendation the scheme was passed as follows:—Minimum initial salary of a mistress with a University degree, or its equivalent, and training, £120; minimum initial salary of a mistress with a Special Honours Certificate of the Cambridge Higher Local, or any equivalent certificate qualifying for Column B of the Register, and with training, £100. In all cases more should be given if the mistress has experience. Minimum rate of augmentation: £10 per annum for the first two years, afterwards £5 per annum, up to a minimum of £150 for non-graduates, £160 for graduates. Further increase to be a matter of arrangement with the governing body from time to time; so that senior mistresses of special qualifications should receive from £180 to £300 or more. The same conditions should apply to mistresses without training who have been registered in Column B before March 6, 1905.

The afternoon meeting was devoted to the discussion of the Consultative Committee's scheme of school certificates. One of the most important of the resolutions carried was Mrs. WITHIEL's: "That with

regard to Clause 16, the Senior Certificate will be of little service in removing the evil of the present multiplicity of examinations in the upper part of the school, unless it is under certain conditions accepted in lieu of the Matriculation examinations of the Universities, and also of Responsions at Oxford and the Previous Examination at Cambridge." The proposals of the Consultative Committee point to a junior and senior certificate at the respective ages of fifteen and sixteen; but average pupils cannot at the age of sixteen have reached a standard of attainment which should qualify them for entrance to a University. Moreover, if the certificates were arranged to be taken as a rule at the ages of sixteen and eighteen, they would correspond to two well marked types of secondary schools—the middle school, with a curriculum planned to give a good general education up to the age of sixteen, and the higher school, which retains its pupils to the age of eighteen and prepares them for the Universities.

It was also resolved in relation to Clause 3: "That the representation of teachers in schools on such examining bodies should be obligatory rather than optional"; and with reference to Clause 17: "That a special mark of distinction should be given in any subject to candidates who had especially distinguished themselves in the ordinary papers on that subject."

PUBLIC-SCHOOL SCIENCE MASTERS' ASSOCIATION. ANNUAL MEETING.

THE papers read at the meetings of the Public-School Science Masters are always valuable, and the discussions that arise therefrom are usually to the point. It is worth while, therefore, to give a few notes and comments upon the fifth annual conference, which was presided over by Dr. Gow at Westminster School on January 14.

The recently issued Report upon the Education of Officers for the Army laid down a number of subjects which it was considered were essential to a sound general education, and afterwards proceeded to suggest that two of these—namely, Latin and science—should be alternative and optional. This curious state of affairs led Mr. Douglas Berridge (Malvern) to submit a paper to the conference on the importance of including both these subjects in the scheme of general education, though he could not help seeing the humour of the situation, for only two years ago the Association was protesting through its Treasurer against "the tyranny of Greek for the ordinary boy." The outcome of the discussion was a consensus of opinion that literary training should go hand in hand with scientific education, but by no means all the speakers agreed that Latin was best suited to afford the former. The opinion of Dr. Gow on the matter is of considerable importance. He advocates the teaching of science to all boys. He does not consider that Latin translation gives style, and he looks upon the training received from Latin as being more of a scientific kind in which the words are species and parsing a classification of them. He seems to consider that it savoured of impudence for the War Office, whose own house was not in very good order, to start teaching schoolmasters what a good education should be. As one speaker pointed out, when students have entered Sandhurst they practically use none of the preliminary subjects, and a suggestion that evidence of any good general education should be accepted by the authorities is a very good one. The general opinion with regard to recent proposals by the Board of Education as to school leaving certificates (dealt with in a paper by Mr. C. I. Gardner, of Cheltenham) was that they should be welcomed, but that State interference should be taken in small doses. The danger was also feared that schools might not be able to give their own individuality free play, though it was thought that inspectors with fads would not cause the same trouble to secondary-school masters in the future as they had to elementary teachers in the past.

The misuse of scientific terms, such as "law" and "theory," and the interpretation and the meaning ascribed to the word "prove," occupied Mr. Humberstone's attention, and his paper elicited from Mr. Fletcher, of the Board of Education, some pertinent remarks with regard to experiments in practical mathematics, about which there is a deeply seated and widespread misapprehension. "It is not intended," said Mr. Fletcher, "that anything should be proved by such experiments, but they enabled the student to get approximations which could be idealized into conceptions." Some little support was given to Mr. Humberstone's contentions that boys often did practical work which was of little use, as it repeated what had already been, to all intents and purposes, done. Prof. Tilden, however, did not agree that more time was given to the work than was needed.

The last paper, touching on the teaching of scientific methods to boys whose education is almost entirely literary, met with the approval of Prof. Armstrong, who wondered, nevertheless, what place in the world there would soon be for the boys under discussion. It seems that the detailed work suggested for fifth-form boys could not well be

carried out without some previous training of the kind which it was sought to afford, and Prof. Tilden might well ask what the fifth-form boys had been doing before they reached the position indicated.

Sir Oliver Lodge was elected President for the coming year, and it was announced at the annual meeting that the Committee appointed last year on Nature study had completed its report, and was about to approach the preparatory schools. It is sincerely to be hoped that there will be no tendency to look upon Nature study as being synonymous with elementary science. Nature study should be a training in observation for all boys, whether they are to learn science or not, and the work should be of a much more spontaneous character than that which is usually confined to the laboratory.

THE NORTH OF ENGLAND CONFERENCE.

THE third annual meeting was held at Liverpool on January 6 and 7.

There was an attendance of over two thousand. Sir W. Anson, Sir Oliver Lodge, Prof. Sadler, Principal Reichel, Prof. Armstrong, and Mr. Sharples, President of the N.U.T., were on the platform. The Lord Mayor welcomed the Conference on behalf of the Corporation and the City. The chair was taken by Lord STANLEY.

Leaving Certificates.

The discussion was opened by Mr. G. W. ALEXANDER, Clerk to the Glasgow School Board. The problem that England was tackling had already been solved by Scotland. The certificates of the Scotch Board were accepted, subject to certain special regulations, by the Universities of Oxford and Cambridge and various legal and medical authorities. With few exceptions, Scotch secondary schools adopted this as their sole examination. The Department had discouraged cram by prescribing no books, and it had stopped advertisement by comparison, publishing only total results, with no particulars as to the performance of particular schools. In elementary schools the Merit Certificate had worked equally well. Though there was no limit of age, it was not issued to a pupil before he had attained the age of fourteen.

Mr. OWEN OWEN, Chief Inspector of the Central Welsh Board, advocated the establishment of Education Councils for each district, and federation of all the Education Authorities in that province to take charge of the inspection and examination of schools within that area. The primary object of a school examination should be to furnish material for a report on the work of the school. It followed that no examination could be considered satisfactory which did not include at least one-third of the pupils. Further, no system was satisfactory if the organization and curriculum of the school were unduly influenced by the requirements of an external examination. The Central Welsh Board had preserved freedom of initiative for schools, even in the later years of the course.

The Rev. L. B. LANCELOT, Principal of the Liverpool College, approved the aim of the Consultative Committee to reduce the number of examinations, but pronounced it unworkable and pernicious in the methods it proposed. Were the professional bodies concerned likely to abandon their own examinations? Examinations were a money-making business in which many kinds of people (except schoolmasters) participated. If the Central Board gave the certificates, he did not envy them the task of securing the practical equivalence of the various examinations. If the provincial system was started, the nearness of a local University might be objectionable, and it would not tend to mutual good will if they were to see Local Authorities flattered and cajoled by the local University into finding employment for underpaid lecturers at the schools' expense. The clause about inspections ought to go. The Consultative Committee had listened to a passing phase. They should trust the head master. The competent head master was himself a permanent inspector. Who was to inspect the inspector? Teaching, they were told, was an honourable profession; but the teacher, they were practically told, was devoid of honour. He needed to be watched and criticized, as was no other profession in the world. Men of spirit would not consent to be degraded in the eyes of their boys.

Sir OLIVER LODGE insisted on the necessity of training. If he himself were called upon to teach the lower classes in a school, he would most distinctly feel that he must go and learn how to do it. He hoped to see examinations conducted in unison, in harmony, in consultation with each separate school or group of schools. Purely external examinations imposed from above placed the schools in an undignified position, and they rebelled. As to the method of joint examination, he suggested that the teacher might set a number of questions for the external examiner to select from, and he saw no objection to the teacher's marking the answers in the first instance, while the external examiner checked the marking and standardized.

Lord STANLEY, in summing up, hoped that in any method of recog-

nizing the work of secondary schools equal value would be attached to that of the modern and the classical side.

After luncheon at the Town Hall, to which delegates were invited by the Lord Mayor, the afternoon session was held at the Liverpool University.

A discussion on "The Teaching of Geography" was started with a paper by Mr. MACKINDER, and one on "Child Study" by Prof. SHERINGTON. Principal REICHEL read a paper on "The Place of Handiwork in the School Curriculum." In the evening a *conversazione* was given by the Lord Mayor and Lady Mayoress in the Walker Art Gallery.

On Saturday the chair was taken by Sir W. ANSON. Miss BURSTALL opened a discussion on "The Scholarship Problem." Dr. MACNAMARA followed. He advocated the allotment of scholarships to schools in proportion to the number of pupils, and deprecated the mixing up of two separate objects—the higher education of clever boys and the recruiting of the teaching profession. Sir W. ANSON, summing up, said that the assignment of scholarships to particular schools would not work, but he agreed that scholarships should be awarded rather on the school work of a pupil than by examination.

At the afternoon sitting the chair was taken by Prof. SADLER. Papers on "The Teaching of English" were read by Miss DRUMMOND and Mr. C. G. STEEL (Rugby). The CHAIRMAN commended the wise action of the Board of Education in making the mother tongue the central study in elementary schools.

A paper on "The Teaching of Domestic Science" was contributed by Miss FANNY CALDER (Liverpool), and papers on "School Games" by Mr. F. W. ANGELL (Liverpool) and Mr. J. L. PATON (Manchester).

THE CLASSICAL ASSOCIATION OF ENGLAND AND WALES.

THE Second Annual General Meeting was held at University College, Gower Street, on January 7. On the previous evening there was a *conversazione* enlivened by two short addresses. Prof. PERCY GARDNER's was illustrated by lantern slides. He showed how the madness of Hercules as represented in ancient paintings differed from the account of Euripides; how the portraits of Sophocles and Euripides brought out the sober dignity of the elder and the morose mysogyny of the younger dramatist. Mr. GILBERT MURRAY in a *causerie* full of quiet humour contrasted the old and new methods of studying a Greek play—the school of Kennedy and Paley with that of Möllendorf and Verrall. The modern teacher must bring home to his class not only what each character in the play says, but why he says it. As an illustration he gave first a traditional rendering of Medea's speech: "Women of Corinth, I left the palace," and then a psychological rendering by the translator of the "Hippolytus."

The first business of the morning sitting, after the nomination of officers and election of new members on the Council, was the appointment of a Committee to advise on the best means of securing a uniform pronunciation of Latin. Mr. BUTCHER, who introduced the motion, pointed to the evils of the present chaos. The Head Masters' Conference had, as far back as 1871, passed a resolution in favour of the reformed pronunciation, but no common action had been taken and the vast majority of public schools had done nothing. As a fact, we believe that Marlborough, Merchant Taylors', Christ's Hospital, and the City of London are the only great schools where the reform has been adopted. The motion was unanimously passed, though Mr. JOHN SERGEAUNT renewed the protest that he made in this journal. It was not without significance that, in spite of this unanimity, speakers, from the Lord Chancellor downward, adhered to the old style.

Mr. R. L. LEIGHTON (Bristol Grammar School) then read an excellently composed paper on "The Educational Utility of Latin." His *thesis* was the solid gain to the pupil who goes no farther than the Caesar stage. He failed, however (if we may interpose a criticism), to show why "Regina puellam amavit" is more educative than "Die Königin hat das Mädchen geliebt."

Mr. RICE HOLMES (St. Paul's School) showed how the "Commentaries" could be made attractive to the ordinary fourth-form boy. (Our criticism here would be that in such a model lesson as Mr. Holmes sketched Latin is the fifth wheel of the coach.)

Mr. A. J. CHURCH interposed a pregnant remark as to how Latin should not be taught. He had just looked over some hundred and fifty Caesar papers of the candidates of a College which should be nameless, and in no one of these papers was there any attempt at real translation—breaking up the complex Latin sentence and turning it into idiomatic English.

The address of the LORD CHANCELLOR was a plea for a more extensive study of the classics—especially of Greek literature, embracing even the Byzantine historians and the Great Fathers, and for a postponement of the *nuances* of grammatical scholarship. It has been fully reported in all the daily press.

At the afternoon sitting, on the motion of Prof. E. A. GARDNER, a committee was appointed to consider how best classical teachers could be helped to keep in touch with the recent results of discovery and investigation.

Mr. PAGE (Charterhouse) proposed the appointment of a committee to consider in what respects the present school curriculum in Latin and Greek can be lightened. The present danger of classical study was not seeing the wood for the trees. It was no longer chiefly literary, but exercised with technical and collateral matters in pronunciation, spelling, emendations, syntactic subtleties. "When I was a boy I spelt as I pleased; now students have discovered that each classical author spelt as he pleased, and that we must master the idiosyncrasies of each." We know more about classical writers than our fathers, and we know them less. We visit their sepulchres, and we offer them all the resources of photography. He urged that in Latin accident, syntax, and composition should be fully studied, but that these in Greek should be reduced to a minimum, and the pupil should be pushed on to actual reading.

Dr. POSTGATE thought that verse-making, except as an aid to the appreciation of metre, should be dropped by all who had not some poetical aptitude.

Mr. WINBOLT (Christ's Hospital) suggested a reformed time-table—translation, 4 hours; grammar, 2; history and literature, 2; Latin prose, 2.

Mr. BUTCHER, who took the place of Sir E. Maunde Thompson, summing up the discussion, feared that the reaction against excessive grammar might go too far. He put in a plea for verse-making, quoting the authority of Dr. Arnold. For translation he desiderated easier and more literary extracts.

It was announced that the Association now numbers over nine hundred members.

An excellent report, including Lord Halsbury's address in full, will be found in the current number of the *Classical Review*.

GEOGRAPHICAL ASSOCIATION.

THE Geographical Association held its Annual Meeting on January 6 at the Royal Colonial Institution. Mr. DOUGLAS FRESHFIELD, the President, referred in his opening speech to his recent correspondence in the *Times*, and complained that geography was the shuttlecock kept flying between the Civil Service Commission and the Universities, either party alleging that the other was not doing its duty by it. Mr. T. ALFORD SMITH, of St. Dunstan's College, Catford, gave an interesting account of his method of teaching—map-making, diagrams, and models in the class-room, followed by the practical work of surveying outdoors. Mr. ELTON, of Wellington College, dwelt on the time difficulty. Geography was not a subject that paid in examinations; consequently one hour a week was the maximum time allotted to it, and the classical head master resolutely resisted any inroad on his timetable.

Mr. B. B. DICKINSON, of Rugby, described how, with a sheet of the Ordnance map as his text, he took his class over the ground, making them trace the watershed, observe contours, &c.

The Association now numbers 448—123 new members having joined during the past year.

* * * We are compelled to hold over the report of a conference on "Leisure Hour Employ," held at Bootham School, York.

CASSELL & COMPANY'S ANNOUNCEMENTS.

NEW AND ENLARGED EDITION NOW READY OF THE STORY OF ENGLISH LITERATURE.

By ANNA BUCKLAND. Cloth boards, 3s. 6d.

This New Edition contains chapters covering the Victorian Period. The volume gives a clear and attractive account of the development of English Literature, and the great names connected therewith; not in the form of an examination cram-book, but as a simple introduction to the subject. The New Chapters are the work of Miss CHRISTABEL COLERIDGE.

FRENCH.

Cassell's Lessons in French. Cheap Edition, Revised. By JAMES BOIELLE, B.A. Parts I. and II., 1s. 6d. each; complete in One Vol., 2s. 6d. KEY, 1s. 6d.

The Marlborough French Exercises. By the Rev. G. W. DE LISLE, M.A. Cloth, 3s. 6d.

The Marlborough French Grammar. Compiled and Arranged by the Rev. J. F. BRIGHT, M.A. Cloth, 2s. 6d.

GERMAN.

First Lessons in German Reading. By A. JAGST. Illustrated. Cloth, 1s.

The Marlborough German Grammar. Compiled and Arranged by the Rev. J. F. BRIGHT, M.A. Cloth, 3s. 6d.

LATIN.

The New Latin Primer. By Prof. J. P. POSTGATE. 26th Thousand. Cloth, 2s. 6d.

The First Latin Primer. By Prof. J. P. POSTGATE. Cloth, 1s.

Latin Prose. By M. A. BAYFIELD, B.A. Cloth, 2s. 6d.

HISTORY.

A History of England. By the Right Hon. H. O. ARNOLD-FORSTER, M.A., M.P. 28th Thousand, Revised. Fully Illustrated. Extra crown 8vo, 816 pages, bound in cloth, price 5s.; or handsomely bound, cloth gilt, 6s. 6d.

ART MANUALS.

Marine Painting in Water Colour. By W. L. WYLLIE, A.R.A. With 24 Coloured Plates. 60 pages, crown 4to, 5s.

Landscape Painting in Water Colour. By J. MACWHIRTER, R.A. With 23 Coloured Plates. Price 5s.

ARITHMETIC.

Marlborough Arithmetic Examples. New Edition. Revised and Arranged by the Rev. C. E. B. HEWITT, M.A., Assistant Master at Marlborough College. Crown 8vo, cloth, 3s. Masters' Copies (containing Examples and Answers), 4s. 6d. Supplied to Teachers only.

CASSELL'S UNRIVALLED DICTIONARIES.

Cassell's NEW French Dictionary. (French-English and English-French.) Edited by JAMES BOIELLE, B.A., Officier d'Académie; sometime Examiner in the University of London. 1,220 pp., cloth, 7s. 6d.; or in half-leather, 10s. 6d.

Cassell's French Dictionary. (French-English and English-French.) 721st Thousand. Revised and Corrected from the latest Edition of the Dictionary of the French Academy. 1,150 pp., cloth, 3s. 6d.; half-morocco, 5s.

Cassell's German Dictionary. (German-English and English-German.) 327th Thousand. By ELIZABETH WEIR. 1,128 pp., demy 8vo. Cheap Edition, cloth, 3s. 6d.; half-morocco, 5s.

Cassell's Latin Dictionary. (Latin-English and English-Latin.) 152nd Thousand. Thoroughly Revised and Corrected. Cheap Edition, 3s. 6d.; half-morocco, 5s.

Cassell's Educational Catalogue will be sent post free on application.

CASSELL & CO., Ltd., La Belle Sauvage, London, E.C.

THE GUIDANCE OF HISTORY. In a speech delivered a few weeks since on Work and Reading, Lord Rosebery observed: "We none of us read enough, we none of us think enough. We need some insight into the past if we are to obtain guidance for the future, and we need some knowledge of the past if we are to do what so few of us do—think a little for ourselves."

Now commencing in Weekly Parts,
price 6d. net,

The EMPIRE EDITION of Cassell's History of England

CONTAINING ABOUT

2,000 Illustrations.

Part 1 just published, and Part 2 will be ready on February 8th, after which the Parts will be issued weekly.

CASSELL'S HISTORY OF ENGLAND is, as the *Standard* remarked, "the most interesting, instructive, and entertaining history of England that has yet seen the light."

"In seven particulars," said a leading journal, "CASSELL'S HISTORY OF ENGLAND is unapproached by any other work. *Firstly*, it covers the entire period of our history, from the time these islands were inhabited by Ancient Britons. *Secondly*, it embodies the results of all modern historical research into the religious, the moral, the intellectual, the social, the economical, and the political condition of the people at different periods. *Thirdly*, it is as full of details as it need be. *Fourthly*, it is popularly written. *Fifthly*, it is profusely illustrated with woodcuts, which help the reader to a clearer understanding of the text. *Sixthly*, it is thoroughly trustworthy, being accurate in its statement of facts, and commendably impartial in its reasonings. *Seventhly*, it is cheap."

OCCASIONAL NOTES.

THE only mention of education in the King's Speech has reference to North Britain. The words are: "You have already partially considered provisions for amending the laws relating to education in Scotland. They will again be brought before you."

The King's Speech. It seems probable that the Bill will propose to divide Scotland into ninety-four School Board areas, each area having full power over all grades of school education within the district. We might have expected some reference to the *impasse* in Wales; but the absence of any such reference goes to show that the Board of Education are still feeling their way, and not yet prepared to strike. In spite of Mr. Balfour's personal feeling in favour of the establishment of an Irish Catholic University, we scarcely expected to see the matter mentioned; but Mr. Dillon was at once to the front with an amendment on the subject, and it cannot be overlooked. The recommendations of the Physical Deterioration Committee have not been thought worthy of inclusion in the King's Speech; but Sir John Gorst and Dr. Macnamara will not neglect to keep this important matter before the minds of members.

WITH Mr. Balfour's eulogy of the Education Bill (February 2), as for the first time organizing the national system of education and co-ordinating the higher and lower branches, we fully concur, as we need not remind our readers. When, however, he touches on what he confesses is an imperfection in the Bill—the religious question—and hints that the Opposition will find it ineradicable, we as strongly dissent. He promises to support any plan "which will give the parents the full control over

the religious education, denominational and undenominational, which is to be given to their children." Now, as we lately argued, it is only parents in the aggregate—the parents of a district or town or village—who can be considered, and their views are adequately represented by the ratepayers, who determine, in their turn, the action of the Local Authority. An alternative is possible—to give the parents of scholars of each school direct representation on the managing body of the school; but this proposal, when the Bill was passing through the House, was strenuously resisted by Mr. Balfour. We should be curious to hear how he, in an ideal commonwealth, would propose to secure to parents that control of teaching which he claims as their prescriptive right.

LORD SPENCER'S letter to Mr. Corrie Grant takes a sufficiently firm tone on the subject of the educational reforms to be expected from the Liberal party when it comes into office. Schools supported by public money are to be placed under public control, and all traces of sectarian tests are to be removed from the qualifications of teachers. On the first of these points there may be some exaggeration. No manager of a non-provided school feels that he is spending public money according to his own sweet will; on the contrary, he is apt to complain of too much public control. We find it difficult to realize the point of view of those who would maintain that the State has endowed sectarian education and has left the sects free to spend the money. It is obviously fair that managers appointed by the Education Authority and by the denomination should be proportional to the amounts respectively contributed. As to the second point, we have no doubt: no inquiry should be permitted into a teacher's religious views. Electioneering promises cannot always be carried out, and we should greatly regret to see another sectarian squabble in Parliament. The changes desiderated can probably be carried out by administrative order.

THE revised report of the Cambridge Studies and Examination Syndicate removes one or two objections that have been raised, but is in principle the same. Instead of a separate paper on Latin or Greek accidence and syntax, we have now grammatical questions arising immediately from the passages set. This is a distinct improvement. The alternative of a prepared book in Latin or Greek is a doubtful concession, but perhaps advisable so long as the opinion of schoolmasters is divided on the point. An alternative is given between unprepared passages in Latin or Greek and easy unprepared passages *plus* easy composition. This seems reasonable, though those who believe in the saving virtue of Latin prose will protest. Candidates who take a set book will be required to answer questions on the subject-matter. This is pure gain.

THE *plébiscite* taken by the Executive Committee of the Assistant Masters' Association is a remarkable document, and emphasizes what we remarked last month as to the divergence of opinion among the bodies of secondary teachers who are to be federated in order to voice the views of this branch of the profession. The two leading associations of head masters, it will be remembered, rejected by overwhelming majorities the Syndicate's proposals. Members of the A.M.A. were asked by post-card: "Do you approve of allowing candidates for the Little-go to offer a sound knowledge of a modern language as a substitute for Greek?"

Mr. Balfour on Parental Control of Teaching.

Cambridge Syndicate's Revised Report.

Assistant Masters on Greek.

Of the 1,513 answers received 1,088 were affirmative, 78 modified or doubtful, and only 347 negative. Nor can it be contended that this majority is composed of masters from small schools, whom the Greek question hardly affects. If we separate the masters in "Conference" schools, the proportion is about the same, and the collective votes of Eton, Harrow, and Winchester give nearly the same result. Whose opinion should prevail—that of the assistant masters who do the teaching, or that of the head masters who are responsible for the teaching, but may or may not teach themselves?

PROF. CHURTON COLLINS (whom we congratulate on his new title) has his say in the *Fortnightly Review* on what he pronounces "the most important crisis that has

Mr. J. C. Collins
on the
Greek Question.

ever defined itself in the history of advanced education." He admits that there is no stemming the rising tide of science, and thinks that Oxford and Cambridge erred grievously in not making terms and conceding Science degrees at the time when the bifurcation of studies took place. Now, however, he would stand in the breach, and he airs once more his favourite thesis that no intelligent study of English literature is possible (witness Mr. Bradley's "Shakespeare") without a knowledge of Greek. "The anti-Greek party (including Dr. H. M. Butler, Mr. A. Sidgwick, Dr. Jackson) know that it [the scheme of alternatives] will have the effect of all but eliminating Greek from the curriculum of every school in the kingdom." "The leading head masters of England (e.g., Mr. Burge, Dr. Wood, Mr. MacClure) are almost unanimous in their opinion that the removal of compulsory Greek would mean its practical extinction outside the University." This might pass in a debate, but Prof. Collins assures us that "he has not been speaking rhetorically." But, even in a debate, to compare the alternative syllabus of French and German and to omit to mention that translation from modern languages is to be done without a dictionary would be an unparliamentary *suppressio veri*. The misstatement that no degree can at present be obtained at Oxford or Cambridge without an elementary knowledge of Greek is a piece of very pardonable ignorance.

ALTHOUGH Mr. Walker, of St. Paul's School, makes it the rule of his life never to attend a conference or to write for publication except on philological questions,

Has the British
Schoolboy
degenerated?

yet the *Strand Magazine* has succeeded in eliciting the opinion that Mr. Walker has noticed no signs of degeneracy in schoolboys. The nine other head masters who have been "drawn" give their views at length; and these are supported by eight portraits. On the whole, the note of pessimism is strangely absent from the opinions. Dr. Warre has nothing to say about the Eton College beagles: his bitterest complaint is against the modern textbook as taking all the grit out of the work—a criticism we endorse. Canon Lyttelton has, of course, his fling at cheap daily papers and magazines. Rather hard, this, on the *Strand*! Dr. James notes a steady progress and pays a warm tribute to the good influence of his sixth form. We should not have been surprised if some of the "great head masters" had lamented the good old times; for they are a conservative race. We suspect the intellectual heroes of the past were Tritons among the minnows. Now we claim that the average boy gets a better education, while the clever boy is as well off as before. In earnestness of moral purpose there has certainly been a great advance, in keeping with the change in thought of the nation as a whole. Dr. McClure contributes a note of cheery optimism.

WE have dealt elsewhere, critically and in detail, with Mr. Sadler's various reports. This is the place to speak of them in general terms and to say how valuable they are and how fully they will repay careful reading. Mr. Sadler possesses in a high degree the faculty for discovering and noting what is good in a locality or in an institution. He uses this as the basis of an appeal for further effort and self-sacrifice. In this way he avoids or discounts much adverse criticism that the report of a less tactful inspector or "surveyor" might arouse. He addresses the "business man," meets him on his own ground, and, in arguments that appeal to him, shows how increased expenditure for education is absolutely necessary at the present time. He gives full credit for all that has been done in the past. Without stating too aggressively the business man's distrust of existing secondary schools, he shows the imperative need of a sound system of secondary schools if the country is to hold a foremost place. Still more noteworthy is his insistence upon the need for really good work as opposed to cheap and showy institutions. And this sound education must, he declares, be based largely upon the study of the group of subjects known as the humanities. At the same time he does not overlook the necessity for training in scientific methods of thought.

THE annual grant made by Parliament to the University colleges in Great Britain amounted last year to the modest sum of £27,000, and the Chancellor of the Exchequer has promised to double the amount in the following year. On elementary education we spend some

Mr. Chamberlain
and the University
of Birmingham.

£13,000,000 out of Imperial taxes. Higher education is much more costly and no less important. University fees—though they may seem to the student to be considerable—are a very long way from covering the cost. At the annual meeting of the Court of Governors of the University of Birmingham, Mr. Chamberlain was hopeful as to the financial future—not because they had enough money, but because he expected the Government to deal more liberally with higher education, and because he expected further grants from Local Authorities and from private benefactors. Birmingham has already raised more than £500,000. Such public spirit deserved, Mr. Chamberlain maintained, further support from the Government. This is quite true, and, however unpopular the proposals may be to the taxpayer, the country will have to recognize that higher education is no less necessary and far more costly than any other grade of education.

TAKING as his text a forgotten manifesto addressed by William Cobbett to the electors of West Surrey, Mr. George Bourne, in the last number of *Longmans' Magazine*,

Nature Study
and Rural Life.

discourses pleasantly of the condition of the Surrey villager seventy years ago. The ideal of rural life that Cobbett held up is no longer attainable; and Mr. Bourne wants to know what can be put in its place in order to give zest to life in a village. The cottager of to-day is to a large extent cut off from an enjoyment of country life by barbed fences. He neither brews his ale nor makes his cider; his wife does not even bake the bread. He flits from place to place so often that he has lost the traditional pride in his garden hedges. His wages suffice to purchase all the absolute necessities of life at the village shop. Beyond the daily toil for his employer he does nothing, produces nothing, in which he can take a pride. Life in a village to-day offers little to the villager except the satisfaction of his physical needs. That this

was not so seventy years ago Mr. Bourne deduces ingeniously from the indirect evidence of Cobbett's address. Mr. Bourne speaks rather slightly of the botany classes in the village school, and there may be some justification for his view. Yet what we now call "Nature study" is based upon the sound principle of teaching a child to enjoy and appreciate his surroundings. Education does not lose sight of the need of training in the use of leisure. The problems Mr. Bourne brings forward may be partially solved by improvements in rural education.

ARE not the Board of Education slightly over-playing the part of moral advisers to the Local Authorities? This month we have another preachment relating to public elementary schools and the Post Office Savings Bank. To inculcate habits of thrift in young children is a wise and praiseworthy object. Philanthropists and moral reformers have not lost sight of the opportunities afforded by the schools. In many schools the children are encouraged by the teachers to save their weekly half-pence. For instance, in the elementary schools of Leeds the sum deposited by the scholars in the Yorkshire Penny Bank averages about 9s. a child. This is, of course, no reason why other schools should not be urged to greater activity in this direction. The Board are very anxious to avoid the appearance of suggesting an "extraneous task" for the teachers—do we see here the power of the N.U.T. behind the throne?—and point out how nice it will be for managers to interest themselves in this matter. Some managers, especially ladies of leisure, are able to do much in this direction, but the teacher's aid must be enlisted, and it cannot be said that teachers are backward in giving their time to work out of school for the welfare of the scholars.

IT is in the elementary school that that indefinable something, aptly called the 'soul of the nation,' is created." We would not exaggerate the influence of school life. It is but one out of many factors that produce character. But even as one of many influences its working is of vital importance. The country is governed by the people, and the education of the people is in the people's hands. Sir Philip Magnus in his presidential address to the Association of Technical Institutions questions if the nation sufficiently realizes this important fact. When the men who administer and control education fully understand this we shall see less haggling over scales of salaries in the desire to save the rate-payer every possible penny and less vexatious interference with the liberty and the freedom of the teachers in the desire to prove that the public purse is being carefully guarded. It is doubtful whether the Local Authorities have yet realized that men are more important than buildings. It is not only a question of salaries: of greater importance is it to give to teachers an honourable position with a certain independence of thought and freedom of action. Sir Philip's words which we have quoted above are equally applicable to secondary schools.

MUCH lies hidden in the modest announcement that secondary schools are to address their communications to the Board of Education, Whitehall, and no longer to South Kensington. Evening schools, technical institutions, and schools of art and art classes will remain for the present at South Kensington. The methods of administration at the latter place have come in lately for severe criticism at the hands of the Local Authorities. The justice of the

censure we have only partly admitted; but we cannot but allow that the policy of the Charity Commissioners as carried out when there was little local interest taken in schools must be greatly modified in view of the Local Government Acts of the last fifteen years. As the old separation between primary and secondary school authorities no longer exists, it is fitting that the supreme control of education should emanate from one centre. Lord Londonderry ought not to have to spend half his life in a hansom or a motor between Westminster and Kensington, nor ought the chief officials in the one office to be obliged to go to the other office in order to consult him. The change of postal address implies, we are sure, a policy of greater vigour and one more in keeping with altered conditions.

HEAD MASTERS in their recent conferences have been considering how they can best adapt their schools to meet the new regulations of the Board and admit intending teachers with the greatest profit to the new class of pupil and the least loss to the old; and they have treated the question as though they were conferring, not receiving, a benefit. Very different is the view of the *Schoolmaster*, which regards the whole movement as the outcome of "unmistakable prejudice and organized opposition" to the pupil-teachers' centre system and an attempt to bolster up effete and moribund grammar schools. "The p.-t. centre is a really first-class institution, giving thorough and well systematized higher education of the very best type. As a secondary school alone it is invariably miles ahead of the local grammar school." There is really no arguing with an advocate who makes such a sweeping generalization wholly unsupported by facts. But, further, the article headed "The Policy of Pushing the Grammar School" contradicts itself. It approves, at starting, the policy of the Board, that the intending teacher should receive the elements of a liberal education, "his course of studies in no way differing from that of other scholars in the school and having no direct regard to his future career"; and a little later on it demands that, "in all the work done with these intending teachers, there should be what may be termed a professional bias." This brings us to the *Schoolmaster's* proposed solution. It is that "young people of the middle and professional classes" who are intended for other professions should be admitted to the pupil-teachers' centre. In spite of Dr. Macnamara's special pleading, Mahommed will have to go to the mountain.

IT was sensible of the ladies and gentlemen who advocate the Holiday scheme to alter their printed statement of its object so as to make it quite clear that it was meant to apply to governesses in private schools and families, and not, as was previously stated, to "ladies engaged in the work of secondary education." As long as the phrase just quoted was allowed to stand, it was not surprising that some of those teaching in high schools raised objections to the scheme, although they were quite willing to recognize the kindness and humanity of those who supported it. It is quite possible for the kindest scheme to do infinite harm if it is based on ignorance and a failure to comprehend all the bearings of a complicated problem with which it deals. Any attempt to put on one side, or to regard as inevitable, the pressing subject of the salaries of assistant mistresses, especially at this critical moment when new schools will soon be opened on every side, would be most injurious to a large number of women workers. But little objection can be raised against a scheme that endeavours to help the

less fortunate members of a profession—those whose income largely depends upon the caprice of an individual employer; though even he might be urged to pay as large a salary as he possibly can, in order that his *employée*, to whom he entrusts the education of his children, should not have to depend on the charity of the benevolent public for her well earned holiday.

THE views which are expressed on the new Scheme for Army Examinations are many and various. The crammers are generally opposed to the changes as futile and perplexing; in particular they resent the decision that they may not prepare pupils for the "leaving certificate," and they are annoyed that, whereas one "leaving certificate" will suffice for any number of "competitive examinations," the "qualifying certificate" must be obtained each time a pupil enters for the "competitive." It seems very doubtful, too, whether it is a good thing for the public schools that boys should be allowed to enter for the competitive examination for Sandhurst and Woolwich at the age of 19½ years. We know the Bishop of Hereford's view, that boys are kept too long at school. Young men of nearly twenty are certainly not wanted in public schools.

REPORTS are current that the definite division of the work of school inspection into elementary, secondary, and technical has now been effected by the Board of Education. It will annoy Sir John Gorst —no doubt he will have something to say on the question in the House of Commons. The new arrangement may prove to be extravagant—distant villages with small educational equipment will be visited in turn by three kinds of inspectors, when one intelligent man might do all the work satisfactorily. But, on the whole, providing that the three branches work together loyally—a rather large assumption, it must be admitted—we are inclined to think that the new system will work well. It is certainly worth a trial.

THE appointment of several new inspectors for secondary schools under the Board of Education raises many important questions. The names of the new inspectors had not been announced at the time of our going to press; but it is understood that their qualifications, both as to academic distinction and teaching experience, are unimpeachable. It is evident that the Board intend to do their work thoroughly, and the pertinent question arises whether or not the Universities will ever play an important part in the inspection of secondary schools. Inspection by the Board is cheap, and it promises to be good: their officers enjoy a status as His Majesty's representatives which can never be acquired by the inspectors appointed by Universities. In view of the present financial position of secondary schools and of the tardiness of the Universities in taking up the work, we are inclined to think—without taking any side in the question—that the future lies with the Board of Education.

THE official Year Book of the Plymouth Education Committee gives in full detail the salaries of the teachers in the secondary schools of the borough. In the boys' department of the Intermediate School the salary of the second teacher is £140, rising by £10 a year to £200; for other teachers £100, rising by £10 to £160. In the girls' department the second teacher £80, increasing £5

annually to £130; for the others £75 to £120. In the Secondary Day School the assistants receive £100 to £170, and the mistresses £100 to £140. In each case the increment is £10 a year. If these payments are not princely, it is, at any rate, a distinct advantage to know exactly what is to be expected. The appointment of all the teachers is in the hands of the Education Committee. No regulations appear to be issued with regard to dismissal. Perhaps the Committee has sufficient belief in the soundness of its selection to make such an alternative unnecessary. Each secondary school is to be visited at least once a month by a member of the Committee, and a rota is given. All teachers will not welcome this publicity; but it is an inevitable step in the tenure agitation. The Year Book contains no reference to Plymouth College; and no details are given of private schools. Probably the next year's issue will supply these omissions.

A *TIMES* correspondent gives an interesting account of the work of the five model schools that Sir William Macdonald is founding in Canada. There is to be a school in each of the eastern provinces. Three are already in full work. The problem in Canada is not precisely analogous to the position in England. The population in Nova Scotia and in New Brunswick is very scattered, and it does not consist of the peasant, but of the farmer. The experiment cannot, therefore, deal with the pupils as if they would always remain on the land. The rural schools must make it possible for the children to proceed to places of higher education in the towns and even to the Universities. At the same time, the education law must be obeyed. These considerations hamper the experiment to some extent. Sir William's main idea is to prepare children for country life by giving to Nature study, manual training, and school gardening a central place in the curriculum. He sees, moreover, that history and literature are equally essential. Part of the problem is to correlate these. We are told that the schools at Kingston and Middleton have won the support of the localities. When a complete report of the Canadian experiment is available, there will be much for English educators to study. The problem is to give the rural child an education in harmony with his surroundings and bearing upon his life without differentiating it entirely from the curriculum of town schools.

NO previous age has shown such keenness in the matter of historical research and investigation as the present one. Whether it be the story of Tell's apple, the palace of Minos at Knossos, or the compilation of the Pentateuch, nothing is taken on trust; everything is made the subject of historical investigation. In London the opportunities of research are of the richest. But the workers are comparatively few and the funds available are scanty. The public meeting presided over by Mr. Haldane will do something to call the attention of some of London's wealthy citizens to an attractive opening for their spare cash. The Advanced Historical Teaching Committee asks for no large sum. A modest £250 for three years will satisfy their desires. The idea is to train up a band of historical students to investigate the historical treasures of London. In all departments of life we find the same demand for training. The lecturers can train the students not only how to deal with historical records, and to get the best results from them, but also how to economize time and labour. London ought to do this work, but would it not be both advisable and feasible to approach the University of London

at Plymouth.**

and to give the lecturers of the fund the status of University professors?

DR. MACNAMARA puts forward in the *Contemporary* some practical proposals for dealing with physical deterioration. First he would adapt to London the *cantine scolaire* of Paris. (1) By it all hungry children would be provided with a dinner ticket, the cost being met by subscription, Exchequer grants, and rate aid (in what proportion he does not say), but he reckons that a half-penny rate would be a generous provision. Parents who can afford to pay for these tickets should be forced by law to pay. This proposal we have sufficiently discussed before. (2) There should be continuous medical supervision of elementary scholars, particularly in the matter of teeth. This is an obvious reform. (3) There should be two years of compulsory evening drill for young men, including the use of the rifle. We consider such continuation schools the best counterblast to conscription.

THE Modern Language Association loses a valuable officer in Dr. E. R. Edwards, who has been its Honorary Secretary of recent years. Dr. Edwards's appointment to an inspectorship under the Board of Education makes it imperative for him to relinquish his work for the Association.

Such, we understand, are the rules of the service. But, if the Modern Language Association has lost an earnest worker, modern language teachers may well feel that the appointment is to their real advantage. Dr. Edwards has been a schoolmaster, and he has enlarged his knowledge of schools by inspecting for the University of London. But first and foremost he is a believer in the value of phonetics as applied to the teaching of modern languages. His present position will give him great opportunities of introducing reforms in this direction. Such reforms will be welcomed by all except the most conservative of teachers. Many modern language teachers are now held back by a want of sympathy on the part of head masters and other higher authorities. It is a great thing also for the Board of Education to have upon their inspectorate a keen student of, and an undoubted authority upon, phonetics. And, if any very up-to-date school shall undertake the teaching of Japanese, Dr. Edwards will be ready with advice and control.

WE are informed that the *Modern Language Quarterly* will not appear again exactly in its present form. The Modern Language Association—which is responsible, financially and otherwise, for this very valuable publication—includes in its members' roll both scholars interested in learned research and schoolmasters engaged in class-room teaching. It has been decided to issue, in future, two publications. Every member will, of course, receive both. The one entitled *Modern Language Teaching* will appear almost immediately. Prof. Rippmann is the editor, and Messrs. Black are the publishers. This is to be issued some eight or nine times a year. The other publication will retain the style and title of a *Quarterly*. The want of a learned paper of this sort is sufficiently obvious, and the Association is to be congratulated upon the public spirit that leads it to support an undertaking that can never be very remunerative. Prof. Robertson has agreed to be the editor, and he has secured already a telling list of contributors. It is hoped that one of the University Presses will undertake the publication.

THE teaching of modern languages at the Universities is by no means well endowed, and therefore the generous gift of Mrs. James Barrow to the University of Liverpool is to be specially welcomed. Mrs. Barrow has given £10,000 to endow a Chair of French in memory of her husband. The gift is not without a certain political significance, for, in making it, Mrs. Barrow expresses the hope that the Chair of French "may serve to remind the citizens of Liverpool that it was founded at a time when the happiest relations existed between their country and France, and that it was the earnest hope of the founder that those relations may always continue." The teaching of French has long been a Cinderella amongst her more favoured sisters. The time has come for the gift of the fairy godmother.

MISS E. P. HUGHES has written to the *Western Mail* a deeply interesting letter on the subject of school discipline, which she maintains is, in England, based on the cane. Now, we are inclined to smile when good-natured busybodies, who write as if they had no experience of school life, shower upon us leaflets arguing the brutality and immorality of corporal punishment. The arguments are often so exaggerated and the alleged evil effects of caning so distorted that the reader fails to be convinced. But Miss Hughes has been a teacher. She has made a study of schools both in this country and in many others. Even her opponents—and they are many—must listen with respect. Miss Hughes considers corporal punishment as an ugly tradition which must be got rid of at any cost. In her travels in Japan she felt herself positively ashamed of the English cane, which would hover in the mental vision over all arguments on school discipline. Miss Hughes is right in saying that a strong feeling against the use of the cane is growing in the country. It is almost a commonplace to say that where there is much caning the discipline is bad; and yet the advocates of this ancient and discredited aid to discipline do not see that it fails to produce the effect expected.

ONE result of a school fee which does not cover the cost of education is the illusory nature of the support given to a school by the establishment of a system of Local Authority scholarships. Many Local Authorities, it is true, give a liberal grant to the school in addition to sending scholars. But this is not always the case; and it seems surprising that head masters and governing bodies are sometimes slow to realize that such scholarships are a financial strain on the school. To give chapter and verse for one instance, we may quote from Mr. Sadler's Huddersfield report. The West Riding Education Committee make an annual grant of £30 to the Almondbury Grammar School, and retain four free places for their scholarship holders. In 1903 the cost per head was £17. 17s. 10d., omitting all capital and establishment charges. In a well equipped secondary school the cost will be not less than £20 per boy for current expenses, and, unless the scholarship awarding body pays the amount, not of the fee, but of the actual cost of the education given, the governors will have to make up the deficiency from other sources. There are many schools where the fee is £6, and where the cost varies from £12 to £18. It is sometimes thought that the Local Authority, by sending a number of scholars, is helping the school. This is not the case unless the Authority also gives a grant.

LOCAL AUTHORITIES.

THE Higher Education Committee of the County of Cheshire have received a memorial from the Liverpool Branch of the Private Schools Association, setting forth the claims of that body to considerate treatment. The

Private Schools in Cheshire.

memorial begins with the statement that the contemplated action of the Authority in establishing Council secondary schools "is likely to constitute a grave danger, as well as gross injustice, to existing private schools." Then follows an argument based on the Bryce Report. This mine of sound judgment, applicable to the educational problems of the day, is perhaps not sufficiently used by the local administrator. The claim of the Association, that private schools should be granted direct representation on any body that deals with the provision of secondary schools, is not unreasonable, and, could the sheep be separated from the goats, would probably prevail with the Local Authorities. It is reasonable, too, that new secondary schools should not be opened until it has been shown that existing accommodation in efficient schools is not adequate. The difficulty is to prove efficiency at a fee that will meet the wants of the locality. The last clause of the memorial asks that the provision of education below cost price should be strictly limited to those who cannot otherwise afford such education. It is scarcely possible to admit this claim. In no public secondary school does the fee paid by the parent cover the full cost of education, including the provision and up-keep of buildings. In most schools the fee is greatly below the actual cost. The Private Schools Association proposes an entire revolution.

THE West Riding Education Committee has reduced the salaries of head teachers in non-provided schools in proportion to the number of hours given to the teaching of denominational religion. In answer to Lord

The Board and Religious Teaching.

Halifax, one of the managers of Hickleton School, Lord Londonderry has written to say that the Board are well aware of the action of the West Riding Educational Authority, and that they think it to be "a violation of the Education Act, 1902, both in spirit and in letter." He adds: "The precise mode of dealing with the matter is now under consideration, with a view to immediate action." We believe that little support, if any, will be given by other Authorities to this vexatious and petty policy of the West Riding, and that every one will be relieved if Lord Londonderry takes a firm line and sticks to it. In regard to the dispute between the managers of the Ashwellthorpe Church School and the Norfolk Education Committee, the Board have replied to the County Authority that, if certain children are withdrawn from school by the desire of their parents and sent to church during school hours, this does not constitute a breach of the by-laws on the part of the managers so long as the school is kept open and the master is present in the school. The remedy of the Authority is to proceed against the parents of the absent children for not sending them to school, though the magistrates might hold that attendance at church was a reasonable excuse for non-attendance at school.

THE London County Council has accepted, with some amendments, the scholarship scheme proposed by the Committee. The candidates are to be over eleven years of age and under twelve on July 31 next following the examination.

Scholarships in London.

No exact limit of number is to be fixed; but the standard is to be such as to enable about 2,600 to be awarded in the year 1905-6. It is decided that the scholarships are to be given in the proportion approximately of one-third to boys and two-thirds to girls, if a sufficient number of eligible candidates present themselves. There is no direct reference to the supply of teachers; but the persistence of the proportion between boys and girls shows that the scheme is regarded as a plan for securing a sufficiency of teachers for Council schools. A Board of Examiners appointed for this purpose will hold a centrally conducted examination and will take into consideration the head teacher's report and the result of the last school examination of the candidates, who are to be nominated by the head teachers. There is also to be a local Scholarship Committee in each electoral division. At least two-thirds of the scholarships are to be held by children whose parents have less than £160 a year. A maintenance allowance of £6, £10, or £14 may be given. The intermediate scholarships continue as at present, except that the limit of age is to be fifteen to seventeen. It is proposed to raise the number of these scholarships to two hundred. The senior scholarships remain unchanged, except that the number is to be raised to fifty.

THE Secretary of the County Councils' Association Education Committee, Mr. Montagu Harris, has compiled an exhaustive report on the salaries of assistant teachers in public elementary schools. From it we take a few of the most striking figures. For

Salary Scales in Elementary Schools.

certificated and trained teachers (men), the lowest salary is £65, which is offered by three county boroughs. In the counties the lowest is £75: the usual salary at the start is £80 to £90. In two counties the maximum is £100. In five boroughs it rises to over £150, the highest being £175. The general maximum is £130, £140, or £150. For women three county boroughs begin at £55 and three counties go no higher than £85. The highest salary, at the start, is £85, and the highest maximum is £130. But £70 to £80 may be taken as the usual minimum, and £100 or £110 the usual maximum. For teachers less fully qualified the scale is naturally lower. For certificated but untrained men the rule is £70 to £80, rising to £100 or £130. The corresponding figures for women are £55 to £70, rising to £90 or £100. For pupil-teachers the variation is considerable. One borough offers as much as £30 for the first year; but £15 to £20 is more usual. In the second year the payment does not rise greatly. One borough goes as high as £35, and one county as low as £12. Again, £20 is a very usual figure. For the third year about £25. These figures are for boys. The girls average about 15 per cent. lower.

MR. SADLER shows such skill and sympathy in emphasizing the strong points of the town of Huddersfield and its inhabitants and such excellent tact in wrapping up the pill of criticism in the conserve of praise that the Committee of Huddersfield can read the report without any sense of shortcoming. But there is no attempt to conceal deficiencies. In the matter of secondary schools for boys Mr. Sadler knows of no town of equal importance in Germany, in Switzerland, or in the progressive parts of the United States of America so ill-provided as Huddersfield.

The population is not far short of 100,000, and there are 751 boys and girls in secondary schools in the borough. The five public schools have a total of 283 boys and 207 girls. The bulk of these are in the College Higher-grade School and the Fartown Grammar School. The latter has very few pupils over fourteen. Through all his reports Mr. Sadler is careful to affirm that a sound secondary education must cover the years from twelve to sixteen. It follows, then, that there is very little real secondary education in Huddersfield, and Mr. Sadler urges that immediate efforts should be made to put the Almondbury Grammar School on a sound financial footing. He argues at length to prove the need of considerable expenditure. The eight private schools only educate 101 boys and 160 girls. That gives an average of thirty to forty pupils to each school—numbers that without endowments or public grants scarcely permit of efficiency according to modern standards. The second urgent need is for the establishment of a public high school for girls. Huddersfield is no worse off than many another English town, and the trouble is chiefly owing to a want of local belief in the value of secondary education. This is shown by the short time the children remain at school. There is no adverse criticism on the teachers.

THE Northamptonshire Education Committee has issued a scholarship scheme which is, to use the consecrated phrase, "in strict accord with the best educational thought on the subject." Twenty-four junior scholarships

are offered for competition in June next, of the annual value of £20; in case of need an additional sum of £15 may be paid towards the cost of boarding when the scholar is unable to live at home. The head teachers are to recommend candidates, either after holding an examination or not as they think best. They will also send a confidential report on the candidate's attainments, character, and promise. A circular from the Secretary, Mr. J. L. Holland, lays especial emphasis on the word "promise." He points out that scholarships are not so much in the nature of prizes to the individual as of investments on the part of the community. The sifting of the candidates recommended by the teachers will be entrusted to a board of examiners appointed for this purpose. Two members of the board will be examiners appointed by some University or other examining body. They, it may be supposed, will do the real work of the written examination. Four members are to be teachers, two in elementary and two in secondary schools. One member is to have special knowledge of the education of girls, and the Education Secretary completes the full number of eight. The first list of candidates selected upon the written examination, supplemented by reports, will be further tested by an oral examination. Anything in the nature of cramming is to be sternly discountenanced. The final selection will be made by the whole board in the light of all the information gained. For the scholarships carrying continued instruction in a secondary school after the original scholarship has expired, and called in this scheme classes B and C, every effort will be made to avoid cram. The candidates will be examined on the work they have done. There are no set subjects, and the teachers' reports will have great weight. There are twelve scholarships of the value of £20 each in Class B, which are given for one year. In Class C there are three, also of £20, competed for from Class B. There is also one of the value of £60 for University education.

It seems likely that the six counties and the three county boroughs that form the district conveniently named "East Anglia" will combine for the purpose of making arrangements for the training of teachers. The Secretary of the Cambridge Education Committee

The Training of Teachers in East Anglia.

(Mr. Keen) has laid a full and detailed report on the subject before a Joint Committee of the Eastern Counties. Considering the number of small rural schools in the area, Mr. Keen shows that 5,561 teachers are required at present, and that the number is bound to increase. Two-thirds of this number should be fully trained. The associated counties will, therefore, require to provide for the additional training of thirty or forty men and about two hundred women teachers annually. The Board of Education give figures that put the cost of building a residential training college at from £150 to £200 per student's place, varying according to site and style. For a non-residential college the estimated cost is £50 or £60 per place. A hostel costs £100 per place. Mr. Keen's complete scheme involves an outlay of £35,000; but it is proposed, for the present, to spend about £15,000 on the provision of additional accommodation at the Norwich and Saffron Walden Training Colleges for Women. The immediate demand for men will be met by the Day Training College at Cambridge. The combining counties are Bedford, Cambridge, Norfolk, Isle of Ely, Suffolk East, and Suffolk West; the boroughs: Ipswich, Norwich, and Great Yarmouth.

ENDOWED SCHOOLS AND PUPIL-TEACHERS.

By P. SHAW JEFFREY.

THE question of the admission of pupil-teachers to secondary schools presents little or no difficulty in the case of the so-called County Secondary Schools, whose fees often do not exceed £3 per annum, and which, from the very nature of the case, must be without many of the traditions and much of the *esprit de corps* of the older endowed Grammar Schools of the country. In the case of the latter, there are certain complications to which I venture modestly to call attention, and for which I venture still more modestly to propose a remedy.

There are many districts in England where the only secondary school accessible to intending pupil-teachers is of the old grammar-school type as regards fees, though probably quite up to date as regards tuition. I take the case of a school whose fees are from £12. 12s. per annum upwards. Experience shows that in this class of school where county scholars are received the parents of such scholars, who might be naturally expected to enter their sons as probationer pupil-teachers, refuse, almost to a man, to do so. "We want," they say, "something better for our boys, or else what is the good of their going to a secondary school at all?"

There is something to be said for this. The parent has often to make considerable sacrifices to clothe his boys in a manner befitting their more exalted opportunities, and, naturally, considers that, if the boy is only to become a pupil-teacher at the end of it all, he might as well have stopped in the primary school, and so have spared his parents the extra expense. The profession does not appeal to the parent at the present scale of remuneration, and the boy becomes, in fullness of time, a boy clerk, and learns to spin out three hours' work over a six hours' day.

There is, however, another side of the question. Scholarships are like blackberries on the educational hedge at present, and it is made possible to many a boy of only average capabilities to attend a secondary school. Suppose, however, that any large irruption of pupil-teacher probationers should take place into an endowed school of the type under consideration. In the present state of social prejudice, for every twenty-five such candidates who enter, twenty-five other scholars—sons of professional men—will leave. Now, it is precisely to these twenty-five that the head master looks to maintain a higher standard of manners and behaviour than could be expected of the mass, and his loss would be immeasurably greater than his gain. I am well aware that this is an unpopular view to take, and that in theory we do not recognize (and very properly so) any caste distinctions at all; but, as long as man is man—and, more particularly, as long as woman is woman—this spectre must raise its unwelcome head; and we shall gain nothing by emulating the ostrich.

We have, then, two difficulties to face—the difficulty of persuading the ordinary grammar-school boy to enter as a pupil-teacher, and the further problem of how to conciliate persons of highly nervous social temperament.

I believe the first difficulty can be met, not by raising (as some suggest) the salaries of all pupil-teachers *en bloc*, but by paying all candidates from real secondary schools on a higher scale. As regards the social question, I suggest that in the endowed schools probationers should be received as boarders in some town other than their native place. The gain to the boys would be enormous, and need not be particularized in an educational journal, and the school would not suffer socially, as many a boy of *bourgeois* extraction can and does gain distinction now-a-days as a boarder in one or other of the great public schools, although the exigencies of the case debar him from attending as a day boy the local "Academy for the Sons of Gentlemen"—as the legend runs.

A double scale of payment is the rule in all Government employment—even the much maligned boy clerk aspires to the Second Division—and no good reason occurs to me for including under the same scale of payment the rather self-assertive product of the pupil-teacher centre and the more modest, more apt, and more responsible product of the endowed secondary school.

The monetary difficulty looms large for the moment, but is not, I suggest, insurmountable. I believe that most endowed secondary schools would receive probationers as boarders on special terms not exceeding 10 guineas per term boarding fee, and, if it were understood that part, or all, of the County Council grant for maintenance was to be repaid by pupil-teachers, on the American system, by a series of annual deductions from their salaries on the higher scale, extending over a fixed term of years, the boarder probationer from an endowed school would start work as a pupil-teacher on conditions at least no worse than those of his contemporary day-boy probationer from the centre, and he would eventually be better off than the latter. The ordinary grammar-school boy who has not required or accepted help from the County Council would, naturally, receive his salary as a teacher without any deduction, and would therefore be, as he ought to be, in the most favoured position.

We should have thus three classes of aspirants—(1) the grammar-school boy, whether day boy or boarder, receiving payment on the higher scale; (2) the County Council probationer coming as a boarder from a secondary school, and thus entitled to the higher scale, but with certain deductions towards the repayment of maintenance grant; (3) the County Council probationer coming as a day boy from the secondary school or centre, and eligible only for the lower scale of payment.

I believe this would differentiate the classes of pupil-teachers automatically, and might be quite successfully worked if safeguarded with proper guarantees of efficiency and conduct. The tendency would, naturally, be for all probationers to become, in course of time, boarders, and, as such, they would imbibe the traditions and excellences of the public-school system more readily than would be possible for them as day boys, while the danger of their becoming a class apart would be minimized. The claims of any teacher on the lower scale to payment on the higher scale due to exceptional efficiency would, naturally, receive consideration after a certain fixed minimum period of service, and payment on the higher scale after the same period of service would not be continued to the original recipients of this payment unless they were proved efficient.

As regards girl pupil-teachers the arguments already advanced in favour of making pupil-teacher probationers boarders apply with tenfold force. Girls' schools are as full of caste prejudice as the Indian Empire, and the high-school girl will never look upon primary teaching as a possible profession until it is made plain to her, by a higher scale of salary, that her services are likely to be appreciated at their proper value.

There is, however, another aspect of this question which must be considered if the profit and loss account of the additional expenditure that this would involve on the part of the State is to be accurately balanced. The present cost of maintaining the national staff of women teachers must be enormous, by comparison with that of providing their colleagues of the other sex, owing to the continual wastage through marriage. Once married, the capable woman teacher disappears from the

arena, and the more capable and intelligent the teacher the more likely she is to contract an early marriage.

Now I imagine that, if the high-school girl were induced to become a primary-school teacher, the State might reckon on retaining her services on an average three or four years longer than it retains at present the services of the ordinary woman teacher. The standard of living and luxury of the high-school girl is appreciably higher than that of the Board-school girl; she would be more difficult to please, and, being at the same time more ambitious, would be likely to delay her marriage to a later date than that now customary among primary-school women teachers.

It will naturally follow that, if the girl probationer from the Council schools becomes a boarder in a high school, she will imbibe the ideas and ambitions of her associates, and, though her education would be more expensive than at present, it is probable that her period of service previous to marriage would be perceptibly lengthened for the reasons suggested above. If necessary, this more lengthened period of service might be safeguarded by extending the period of repayment over a longer term of years than would be necessary in the case of a man teacher.

DIRECTORY OF EDUCATIONAL ASSOCIATIONS.

THE object is stated only when this is not obvious from the title or not known by general repute. The following number gives the membership as far as ascertainable. Then follow the yearly subscriptions, the name of the Secretary, and office address.

- Aberdeen County Schoolmasters' Association.
Mr. George Murray, Dyce, N.B.
- Agriculture, Scottish Teachers of, Incorporated Institute of.
Mr. John W. Sinton, Dalmeny, N.B.
- Alliance Française.
45 rue de Grenelle, Paris. (Secretary for England, M. Belfond, 8 Barnard's Inn, Holborn, E.C.)
- Army School Appointments.
Address A.A.G., Army Schools, War Office, 68 Victoria Street, S.W.
- Art for Schools Association.
£1. 1s. Miss M. L. Cooper, 46 Great Ormond Street, Bloomsbury, W.C.
- Art Masters, Society of.
300. £1. 1s. Mr. Francis Ford, 50 Broomhouse Road, Fulham, S.W.
- Arts, Society of.
£2. 2s. Sir H. Truman Wood, 18 John Street, Adelphi, W.C.
- Art Teachers' Guild.
For teachers of drawing in schools. 2s. 6d. Miss B. Collins, Skinners' School for Girls, Stamford Hill, N.
- Assistant Masters, Incorporated Association of.
Masters in secondary schools, both public and private. 1,700. 10s. 6d. Mr. C. J. Mackness, 27 Great James Street, Bloomsbury, W.C.
- Assistant Mistresses in Public Secondary Schools, Incorporated Association of.
2s. 6d. Miss Macklin, 141 Inverness Terrace, W.
- Assistant Teachers' Associations, National Federation of.
14,000. Mr. J. T. Boulter, Warwick House, Warwick Street, Leicester.
- Associated Board of Royal Academy of Music and Royal College of Music.
Holds local examinations. Mr. James Muir, 14 Hanover Square, W.
- Association to promote the Higher Education of Working Men.
Mr. Albert Mansbridge, 198 Windsor Road, Ilford, Essex.
- Authors, Incorporated Society of.
£1. 1s. Mr. G. Herbert Thring, 39 Old Queen Street, S.W.
- Birmingham Teachers' Association.
- Board of Education Library.

** * Corrections are invited. Address—Office of "The Journal of Education," 3 Broadway, Ludgate Hill, London, E.C.*

JOTTINGS.

THE work of the teacher is not yet properly recognized by the public. It is a great strain, and, in addition to that, it is a personal strain. In teaching a large class the master has to be at his best all the time, and this is true of hardly any other profession except surgery. For this work it is now generally recognized that training is necessary. In fact, there is a more and more growing demand upon the teacher, and accordingly it is necessary for the welfare of the country that it should recognize his work, and raise the standard of the profession in every possible way, so as to attract the best men and women of the country to enter it. At present there is a great lack of candidates; and I am not surprised, because the remuneration is sometimes very moderate. I advocate liberality in this matter, not from personal reasons, but I regard the money spent in education as the best investment for the country.—Sir O. Lodge, at Walsall Grammar School.

IN a recent Rudiments paper Joab occurred among Old Testament characters of whom short lives were required. One candidate wrote: "This patriarch (whose name, by the way, is misspelt) was a patriarch in the Land of Uz."

JOWETT's translation of Aristotle's "Politics" is being issued by the Oxford University Press, uniform in style with Plato's "Socratic Dialogues," also translated by Jowett, Dean Wickham's "Horace for English Readers," and Mr. Tozer's translation of "The Divine Comedy." Mr. H. W. C. Davis contributes introduction, analysis, and index to the "Politics."

"IN London," according to Mrs. Barnett (*Contemporary Review*, February, page 233), "over 330,000 have to live, eat, sleep, be ill, and die—yes, and be born—in one room." No wonder that "the death-rate consequent on these conditions is very high."

THE moon on February 19 performed with admirable exactitude the programme announced for her in the *Daily Chronicle*, which was able the next day to report: "The eclipse of the moon last night was entirely successful, and passed off without a hitch."

As a parallel to Dr. Macnamara's arithmetical puzzles, A. E. Layng sends us the following question in practical geometry, set last Midsummer in the Second Class Certificate paper of the College of Preceptors:—"A brick measures 5 inches in length, 2 in breadth, and 2 in thickness. Show that it can be divided into six cubes." The two problems seem to us of about equal difficulty (or rather easiness), but the second, unlike the first, is a guessing one.

SPEAKING of the supply of pupil-teachers in Liverpool, Mr. Sadler says: "Those who clearly did not 'frame' for the work might be weeded out." If frame is wanted, would it not be well to try a much-advertised food before beginning horticultural operations?

THE *Schoolmasters Yearbook* gives the names of 15 head and assistant masters who have retired during the past year; of these 14 were in clerical Orders. Out of 37 appointments of assistants to headships only 8 were in Orders. Ten head masters have been promoted to other schools, 9 of whom are laymen.

THE Head Master of the Grammar School, Kingston-on-Thames, whose proposals for a reformed school dress have been widely noticed, has informed the governors that many parents have already fallen in with his plans, and that the movement is likely to become general. The costume consists of loose woollen garments in the school colours.

THE girls of Chester now go to school in the stand on the Chester racecourse. The building has been approved by the Board of Education as a temporary school, and a rent of £150 per annum is to be paid while the permanent buildings are being constructed.

BEFORE the 1902 Act the county of Surrey had a very low average attendance of children in the public elementary schools. If the attendance goes up by 1 per cent., the county gains an extra grant of £1,200 a year. By spending a few hundreds in reorganizing the system of attendance officers the Education Committee hope to reach the standard of 90 per cent., and so to secure £12,000 a year more out of the Treasury. This should prove a popular move with the ratepayer, and make the work of the attendance officer much easier.

SPURRED on to fresh hope by the announcement of Dr. Warre's resignation, the Humanitarian League is making a renewed attack upon the Eton College Beagles. The existence of the pack is certainly an anachronism.

MR. W. LORING, who recently resigned the post of Director of Education in the West Riding, has been appointed by the University of London Warden of the Goldsmiths' College, New Cross.

COLONEL NEWCOME laid a deep scheme with his friend Binnie for the examination of young Clive in the humanities, and on his return from Mrs. Newcome's party he asked eagerly: "What do you think of his Latin and Greek?" "Wall," cries the Scot, "I find that the lad knows as much about Greek and Latin as I knew myself when I was eighteen years of age." "My dear Binnie, is it possible? You, the best scholar in all India?" "And which amounted to exactly nothing. He has acquired in five years, and by the admirable system pursued at your public schools, just about as much knowledge of the ancient languages as he could get by three months' application at home."

THE world is getting visibly smaller, and distance is no bar to knowledge. Mr. Louis Rouillion, Professor in Columbia University, has been appointed Chief Inspector of Technical Education for Ireland.

MR. B. M. ALLEN, who has been Assistant Secretary to the late Technical Education Board, has been appointed to the position of Assistant Executive Officer in the Education Department of London at a salary of £600, rising to £800. The other new post has been given to Mr. E. M. Rich, who is to be Principal Assistant in the executive officers' branch at a salary of £400, rising to £600.

At the sixth annual meeting of the London Branch of the German Language Association Dr. Weiss announced that there were now 542 members, and that a successful year's work had been carried out.

IN an obituary notice of the late Rev. Theophilus Rowe, the *Yorkshire Post* says that he was at one time an assistant master at "Uppingham-under-Thring."

THE HON. MAUDE LAWRENCE has been appointed to the post of Chief Woman Inspector under the Board of Education. Miss Lawrence, who has had wide experience of educational work in connexion with the late London School Board, will direct a staff of women inspectors of special qualifications and varied experience, who will assist the Board in dealing with questions affecting the education of very young children, of girls and young women in schools, pupil-teacher centres, and training colleges. The Board naively confess that "they have hitherto been somewhat imperfectly equipped" for dealing with these questions.

THE London County Council has to pay £30 damages to a girl in a Council school whose hand was injured in a wringing machine during a laundry lesson. No charge of negligence was made out against the teacher in control of the class, but the Judge found that the Council were guilty of a breach of their duty in not having the machine sufficiently guarded.

AT the Conference of Free Churchmen, the Rev. T. M. Rees, of Flintshire, cited the case of a school being opened in opposition to a Church school. "When some of the girls went back to the Church school for their sewing, the rector struck them with an umbrella. The bodies of three of the girls bore marks of this ecclesiastical tyranny." Inquiries have, so far, failed to discover the name of this "monster."

A CIRCULAR has been sent to the head teachers of the Leeds public elementary schools reminding them that no assistant teacher may inflict corporal punishment of any kind. The boxing of ears, slapping, pushing, and stimulating nudges are expressly forbidden. By way of contrast, it is interesting to note that all the assistant teachers under the Aberdare Authority have sent in their resignations because corporal punishment is forbidden. As we get to know Japan better, we may be more inclined to adopt the mild methods of discipline in vogue in that country. Corporal punishment is dying slowly and surely. The next generation will wonder at our rough-and-ready methods of discipline.

THE Board of Education have, for the present at any rate, refused to be beguiled by the Manx Language Association into supporting its efforts to reintroduce the ancient tongue.

It is distressing to think that, while we have all been worrying for years over the education problem, Mr. W. S. Lilly had the solution in his pocket all along. Under the title "The Key of the Education Question," Mr. Lilley has just communicated it to the *Times*. It appears to be this: Parents are entitled to the full control of the religious education given to their children. "Lilia parturiunt"—we will not continue the quotation.

JUST two years ago a schoolmaster characterized one of his pupils as "a bad boy." A libel action followed, and the master was cast in damages. An appeal was allowed, and judgment has just been given by which the original judgment is reversed. In prehistoric Harrow days we remember a master catching a boy letting loose a fowl in school. "Little fool," he began, "confounded little fool," and, as the cock fluttered on to his desk and upset the inkpot, "d—d little fool!" It is fearful to contemplate the damages such language would now entail.

If sufficient local support is forthcoming, the Treasury has consented to make a grant towards the establishment of a national museum and a national library for Wales. Lord Balfour of Burleigh, the Earl of Jersey, and Lord Justice Cozens-Hardy have been appointed by the Lord President to deal with the matter.

THE KING has consented to open the new wing of the Armstrong College of Science at Newcastle-on-Tyne.

CAMBRIDGE LOCAL EXAMINATIONS.—The class lists show that the total number of candidates entered for the Cambridge Local Examinations held in December last was 15,655, exclusive of 1,755 candidates examined at Colonial centres. In the Senior Examination 670 boys and 1,062 girls passed, 77 boys and 20 girls being placed in the First Class. Sufficient merit was shown by 344 boys and 77 girls to entitle them to exemption from one or both parts of the Previous Examination. Of the Junior candidates 3,231 boys and 1,973 girls passed, the numbers placed in the First Class being 472 and 64 respectively. In

the Preliminary Examination 2,476 boys and 1,562 girls satisfied the examiners.

MEMBERS of the Teachers' Guild are reminded of the lecture to be given by the Rev. Canon Beeching on "The Spiritual Teaching of Shakespeare," at Bedford College, York Place, Baker Street, on Friday evening, March 17. The chair will be taken at 8.15 p.m. by Mr. S. H. Butcher, Litt.D., LL.D., Chairman of the Council of the Teachers' Guild. Members desirous of obtaining tickets should apply as soon as possible (by post-card) to Miss Burns (Hon. Secretary Section D), 36 Norland Square, W., who will supply them by post as far as space is available.

THE German Language Association celebrated last month its sixth anniversary at the Holborn Viaduct Hotel. The Association now numbers 542 members. The founder and president read a complimentary letter from Mr. A. J. Balfour.

THERE are two burning questions in the air at the present time concerning English schools. One is as to the curriculum—what subjects should be selected for teaching; the other is as to the method how they ought to be taught. These questions were dealt with by Sir Oliver Lodge, Principal of Birmingham University, in a course of four lectures which he delivered in February to secondary teachers and teachers in training. They will be published very shortly in book form by Messrs. Williams & Norgate under the title "School Teaching and School Reform."

THE London County Council propose to open classes in midwifery. Pedagogic name: "practical hygiene."

THE appointment of Prof. Walter Rippmann as Staff Inspector of Secondary Schools under the University of London is announced.

WE notice that the *Daily Mail* refers to the "leaving certificate" as the "learning certificate." *Prosit omen!*

DR. WORMELL succeeds the Rev. T. W. Sharpe as President of the College of Preceptors. Mr. Sharpe, we regret to say, has been compelled to resign on account of failing health.

WE understand that the candidates in the running for the Head Mastership of Eton are Mr. Rawlins, of Eton; Rev. L. Ford, of Repton; Rev. S. James, of Malvern; the Rev. B. Pollock, of Wellington College. Mr. A. Benson is not formally a candidate.

OBITUARY.

THE REV. T. B. ROWE.

THE Rev. Theophilus Barton Rowe, whose death we announced last month, was a distinguished, though not in all respects a successful, schoolmaster. A man of rare attainments and liberal views, and a temperate reformer who could hold the balance between the old and the new learning, he lacked the art of conciliation and of recommending his views to governors and parents.

Mr. Rowe was born in 1830, the son of the Rev. Samuel Rowe, a Wesleyan minister. He was educated at Woodhouse Grove, a Wesleyan school near Leeds. At Cambridge he took double Honours, graduating in 1856 as Third Classic and Thirty-first Wrangler. He obtained the Chancellor's Medal and was elected a Fellow of St. John's College. After a short apprenticeship at Bath College he was appointed, in 1861, by Mr. Thring to a mastership at Uppingham, whence he passed, in 1876, to the Head Mastership of Tonbridge School. The school, under his predecessor Dr. Welldon, had been purely classical. Mr. Rowe, following in the footsteps of Mr. Thring, not only encouraged the pursuits of drawing, music, and manual instruction, but introduced natural science as an integral part of the curriculum. A gymnasium and workshops were added to the school buildings, and it is in great part due to him that Tonbridge can boast the best science laboratory of any public school. Numbers, however, declined, and in 1890, when Mr. Rowe resigned, they had fallen from 240 to 175. We have already hinted at the chief reason of this ill-success, but we may add another. Mr. Rowe was an advanced Broad Churchman, and Tonbridge is, or was, a centre of Evangelicalism.

ERRATUM.—In our report of the meeting of the Incorporated Association of Head Masters there is an unfortunate misprint. It was *b* (2), not *b* (1), of Dr. Rouse's resolution that was rejected—that is, the demand for a Board of Education grant on preparatory classes.

MESSRS. J. M. DENT & CO.

have pleasure in announcing a new Series specially prepared in view of the EDUCATION DEPARTMENT'S NEW REGULATIONS for the teaching of English Language and Literature in Schools.

LIST OF VOLUMES.

The Volumes marked with an asterisk are now ready, and the remainder, it is hoped, will be issued by the end of March following.

ENGLISH POETRY. Selected, with an Introduction and Notes, by ARTHUR BURRELL, M.A., Principal of Borough Road Training College, Isleworth. 18. net per Vol.

I. Lyrical.

II. English Heroic Verse.

*III. Selections from Shakespeare.

ENGLISH BALLADS. Selected, with Introduction and Notes, by OLIPHANT SKEATON, M.A. 18. net.

***MACAULAY'S LAYS OF ANCIENT ROME.** With Introduction and Notes by OLIPHANT SKEATON, M.A. 18. net.

***LONGFELLOW'S HIAWATHA.** With Introduction and Notes by HENRY WILLIAMS, M.A. 18. net.

STORIES FROM THE ODYSSEY. By R. J. G. MAYOR, F. S. MARVIN, and F. M. STAWELL. 18. net.

***STORIES FROM THE MORTE D'ARTHUR AND THE MABINOGION.** By Miss BEATRICK CLAY. 18. net.

***STORIES FROM SPENSER'S FAERY QUEENE.** By Miss N. G. ROYDE-SMITH. 18. net.

SCOTT'S TALISMAN. With Introduction and Notes by HENRY WILLIAMS, M.A. 18. net.

***SOUTHEY'S LIFE OF NELSON.** With Introduction and Notes by HENRY WILLIAMS, M.A. 18. net.

***GRAY'S ELEGY IN A COUNTRY CHURCHYARD.** With an Introduction and Notes by E. BOWEN. Limp cloth, 3d. net.

***GOLDSMITH'S TRAVELLER AND THE DESERTED VILLAGE.** With an Introduction and Notes by W. LANGRIDGE. Limp cloth, 3d. net.

***COLERIDGE'S ANCIENT MARINER.** With an Introduction and Notes by K. McWILLIAM. Limp cloth, 3d. net.

WORDSWORTH'S SIMPLER POEMS. Limp cloth, 3d. net.

The last four texts will be issued separately in limp cloth covers at 3d. net per Vol., or the four bound in one Vol., 1s. net.

BURKE'S FRENCH REVOLUTION. With Introduction and Notes by Rev. Professor SMITH, D.D., LL.D. 18. net.

THE SPECTATOR.—A Selection.

During the past few years the following books have been published. These have also been suggested in the Circular issued by the Education Department.

Scott's Lady of the Lake. Introduction and Notes by FLORA MASSON, 18. 4d.

Scott's Lay of the Last Minstrel. Introduction and Notes by J. W. YOUNG, M.A. 18. 4d.

Scott's Ivanhoe. Introduction and Notes by G. L. TURNBULL, M.A. 28.

Shakespeare's Julius Cæsar. Introduction and Notes by F. ARMYTAGE MORLEY, M.A. 18. 4d.

Shakespeare's Henry V. Introduction and Notes by R. H. CASE, M.A. 18. 4d.

Shakespeare's As You Like It. Introduction and Notes by FLORA MASSON. 18. 4d.

Shakespeare's Tempest. Introduction and Notes by O. SKEATON, M.A. 18. 4d.

Shakespeare's Merchant of Venice. Introduction and Notes by R. McWILLIAM. 18. 4d.

Shakespeare's Richard II. Introduction and Notes by W. KEITH LEASK, M.A. 18. 4d.

Milton's Paradise Lost.—Books I. and II. With Introduction and Notes by W. K. LEASK, M.A. 18. 4d.

Spenser's Faery Queene.—Book I. With Introduction and Notes by Prof. W. H. HUDSON. 2s.

Kingsley's Heroes. With Introduction and Notes by OLIPHANT SKEATON, M.A. 18. 4d.

IN RAPID PREPARATION.

PRACTICAL NATURE STUDY for SCHOOLS.

By OSWALD H. LATTER, M.A., F.E.S.,

Senior Science Master at Charterhouse, formerly Tutor of Keble College, Oxford.

PART I.—A Note Book of Questions for Pupils, containing a series of directions and of numbered questions to be answered by direct reference on the part of the pupil to the concrete objects themselves. Space is given for the insertion of answers, and the left-hand page is blank for drawings and diagrams that the pupil himself will make to illustrate the work done.

PART II.—Complete and Numbered Answers to Questions for the use of Teachers only.

Complete Catalogues of Messrs. Dent's other Educational Books sent free.

Date of publication of next issue will be found at top left-hand corner of front page. [Advertisers are reminded that "Letters addressed to INITIALS or to FICTITIOUS NAMES, or to a CHRISTIAN NAME without a SURNAME," at Post Offices are not taken in, but are sent at once to the Returned Letter Office.]

All Letters respecting Advertisements and Subscriptions should be addressed—"THE PUBLISHER," JOURNAL OF EDUCATION Office, 3 BROADWAY, LUDGATE HILL, E.C. Money and Postal Orders, on the Post Office, Ludgate Circus, E.C., should be made payable to WILLIAM RICE; Orders and Cheques may be crossed, "The London City and Midland Bank, Ludgate Branch." Postage stamps can only be received at the rate of thirteen to the shilling.

If a receipt is required for an advertisement under 10s., a postcard or a stamped envelope must be enclosed.

Notice must be given of all remittances through the Post Office from abroad, stating full name and address of the sender; and all Foreign Money Orders must be crossed for payment through a Bank.

LONDON: WILLIAM RICE, 3 BROADWAY, LUDGATE HILL, E.C.

HEAD MASTERS AND ASSISTANTS.

IS CODLIN THE FRIEND, OR SHORT?

ASSISTANT MASTERS find themselves upon the horns of a dilemma. They have revolted against the ancient tradition of their servitude. Two parties—head masters on the one hand and Local Authorities on the other—seem to offer them support in the struggle. At present these two parties are in opposition to one another. To which, then, shall the assistant master turn if he cannot have the help of both? This article will attempt an answer to the question. But, first, a little recent history must be restated.

For some years past the Authorities established by the Technical Instruction Acts have shown signs of a desire to obtain more control over the administration of secondary schools. Since the passing of the 1902 Act this movement has gained ground, and it is now clear that the quiescent governing body and the autocratic head master are seriously threatened. Against this incursion into the sacred realms of secondary-school management the head masters thought they would find an ally in the Board of Education, the South Kensington branch of which has inherited the traditions, and certain members of the staff, of the Endowed Schools Branch of the Charity Commission. They thought that, if the profession showed a united front, and was supported by the Board, the Local Authorities would be brought to heel. So the Incorporated Association of Head Masters approached the Incorporated Association of Assistant Masters with the proposal that a joint expression of views on the subject of the tenure of assistant masters in endowed or other secondary schools of a public character should be issued in the names of the two Associations. The invitation was eagerly accepted by the Assistant Masters, every whit as anxious as their seniors to demonstrate the solidarity of the profession. A concordat was drawn up and issued, in which it was clearly laid down that the assistant is to be deemed the servant of the school—i.e., of the governing body—and is no longer to be considered the servant of the head master, dependent upon his will and pleasure. Such an admission speaks well for the genuine desire of the

head masters to meet the wishes of the assistants—for, to men nursed in the old traditions, the proposal might seem to smack of heresy. It was recognized that the changes involved an amendment of the Endowed Schools Acts; but it was thought that the Board would be favourable both to this and to the proposal to afford an appeal to the Board against alleged unjust dismissal.

To the amazement of every one concerned, the Board, after a delay of many months, returned, in July of last year, a reply intimating that the desiderated reforms were impracticable. And, in spite of a subsequent deputation, grudgingly admitted, it seems clear that South Kensington is entirely disinclined to move in the direction of the *concordat*—though no formal reply to the deputation has yet been issued. The Board, it appears, desires to maintain the view of the Endowed Schools Commissioners, although this view is approved by neither schoolmasters nor by Education Committees, and although circumstances have entirely altered since the Commission sat, and several new factors have appeared.

Had the *concordat* been at once accepted, it is probable that the assistant masters, though inclined to be restive under the belief that too much power had still been left to the head master, would have abided loyally by its conditions. But it has been for some time evident to observers that a revolt has been gathering strength among assistant masters. There are two prevailing currents of opinion. There are those who say that at any seeming sacrifice of immediate gain the profession must show a united front; the real cleavage, argues this section, is between the professional and the administrative sides—blood is thicker than water, and assistants must range themselves with their titular chiefs. The other party, inclined to trust to the tender mercies of Local Authorities, is, it appears, gaining weight. The reasons for this are not far to seek. While the head masters are timidly making up their minds to a tardy instalment of long-awaited reforms, some of the Education Committees have made proposals which will go far to render the *status* of the assistant master a dignified and honoured one.

Probably every assistant master in England has read Dr. Snape's scheme for the improvement of secondary education; and other authorities, so far as they have expressed their views, seem no less sympathetic towards the natural desire of the assistant master to claim a worthy *status* for himself. At the recent meeting of the Association of Directors and Secretaries for Education, the President (Mr. Wilkinson, of Bolton) devoted part of his address to this question. Here are one or two short extracts:—

Surely the assistants in our secondary schools have their rights as to tenure as well as head masters! Is there no court of appeal? Is the head master's stable-boy to be in a better legal position than the responsible assistant in the secondary school? . . . Is he to be for ever without any remedy for a grievance which cannot be defended on any moral or sane grounds? . . . Why should the Local Authorities be asked to consent to a system which is little removed from the serfdom of the middle ages? . . . The assistants in endowed secondary schools have been too long in bondage, and now the opportunity is coming when our Committees can help them to their emancipation. I sincerely hope that the Authorities of this country will protest in the very strongest manner against this modern recrudescence of despotism.

There is a good deal more in the same style. Discounting Mr. Wilkinson's platform oratory, and admitting the natural desire of an Education Secretary to have his finger thrust well into the pie that the Local Authority has helped to fill, we yet find a sufficient indication of the attitude of Local Authorities towards secondary schools. And this indication of the direction of the prevailing wind does not lack ample support from other quarters. It cannot be denied that the government of endowed schools is a survival out of harmony with democratic times. Before long the need for financial aid will considerably modify the position of governing bodies.

But it is not only in the matter of tenure that the Local Authorities seem to be the best friends of the assistant master. The Head Masters, more timid than the Head Mistresses, have hesitated to publish and press forward a salary scheme, as they ought to have done. The Local Authorities, on the other hand, after preparing scales of salaries for teachers in public elementary schools, cannot do otherwise than mete out the same treatment to the staff of such secondary schools as are under their control. If it be true that the governing bodies have come to an end of their supplies, and cannot, if they would, find

money for increased salaries and pensions, an additional reason is offered for reliance on Local Authorities, who hold the strings of a purse of unknown depth.

The Association of Assistant Masters has great vitality in the North of England, and it is just in these districts that the Education Committees seem most disposed to combat the head master's claim to autocracy, and most inclined to find liberal funds for the payment of the staff, so long as their legitimate demands for control are not opposed. Under these circumstances, it is no wonder if assistant masters doubt whether blood is thicker than water. The Northern Section, accustomed to deal with Local Authorities alike generous and determined to make of secondary education a structure of which the country may well be proud, are justified in asking if it be really for the good of the Association to remain under the wavering banner of their traditional leaders. The apparent failure of the negotiations with the Board seems to have given a clean slate.

Yet, need it come to this? Those who welcomed so cordially, and worked so hard to keep green, the olive branch held out by the head masters will surely rise in protest. Granted that, in an ideal State, all alike—Board of Education, governing bodies, Local Authorities, head masters, and assistants—will work together for the benefit of education; yet, in our imperfect conditions, it seems that there must be parties. These parties may co-operate in a perfectly friendly manner, but on certain points the teacher will not always see eye to eye with the administrator. Those who work in the class-rooms understand certain aspects of the problem, and possess a knowledge, that must always be a mystery to the Education Committee or its secretary. Questions are not infrequently arising on which schoolmasters hold a different opinion from that taken by the guardians of the public purse. The Association of Assistant Masters has been eager in promoting the proposed Federation of Secondary Teachers. It will not desire to cause dissension in the camp, and therefore it will be coy in its coquetting with the Local Authorities.

But the assistant master who objects to this policy may inquire if, for the sake of a traditional sentiment and in the hope of a problematic benefit, he is to yield in his struggle for independence and to be content with the scanty crust that the head master throws him. It does not seem that matters have yet come to such a pass. The present position of the assistant master is exceedingly strong. For the moment, he seems to have the game in his own hands; he holds the winning cards. Want of funds is forcing, in the case of most schools, the governing body to appeal to the Local Authority. The provision of these funds inevitably means more public control. The assistant master will become more of a public servant. The amount of his salary will be printed in reports, and will be made the subject of discussion at committee meetings, and perhaps in the local press. To a certain extent this publicity will be a protection. It may be open to question if the assistant will quite like the changed conditions in all their aspects, but they seem to be inevitable. It behoves, therefore, the head master to recognize that he is losing his traditional autocracy, and that, if the professional element is to make itself felt, he must unite with the assistant master on a platform of common interest. It is clear that, unless the conditions of tenure are very greatly improved—that unless larger salaries are paid, and unless automatic increases and pension funds are provided—there will be a serious falling-off in the supply of assistant masters. Already, in the opinion of many observers, the supply is showing signs of deterioration in quality, if not in quantity.

There is no desire, in this article, to overlook, or even to minimize, the dangers that lie ahead as a result of the democratizing of secondary education. The ratepayers, in their ignorance, may want to establish a system of cheap and showy secondary schools. To prevent such a catastrophe, the profession should unite to offer its expert advice. This union can only be effected if the head masters will whole-heartedly join with their junior colleagues in demanding the reforms that are long overdue. The most pressing of these reforms are—firstly, tenure. The assistant master must be recognized as the servant of the school, appointed and dismissed, if occasion should arise, by the governors. The head master, as adviser to the governing body, will retain, to a very large extent, his power of selection—though this power will depend upon his personal character. The second urgent reform implies the provision of further funds for secondary education. Such funds

will be forthcoming when their absolute need is demonstrated. The head masters ought not to hesitate to urge that in the interests of the country salaries must be increased and must rise automatically, and, further, that pensions must be granted. The minimum salary for a fully qualified assistant master is £150, rising by £10 a year to £300. This is the minimum below which no school supported out of public monies ought to be allowed to fall.

Circumstances are forcing the hands of the head masters. The Reading School affords an object lesson not to be overlooked. The head masters will be no weaker, but, on the contrary, considerably strengthened, if, by yielding to the legitimate demands of assistant masters, they thereby retain their allegiance. The question, then, we started with is answered; blood is thicker than water. The friend of the assistant master is the head master. But an alliance demands mutual forbearance and consideration; each side must enter into the feelings of the other.

QUANTITATIVE READING.

By T. S. OMOND.

IT may seem rash to assert that most of us neglect quantity in reading Greek or Latin. Knowledge of quantitative rules has been the hall-mark of English scholarship, a "false quantity"—within certain limits—the worst of blunders. But the limits have always been strangely narrow. The teacher who would be shocked if his pupil said *profugus* has himself no scruple in saying *prōfugus*; he probably says *oris* for *oris*, almost certainly *Italiam* for *Italiam*. Nor is it only unaccented syllables which are thus maltreated. In my young days, at any rate, it was common to hear *cay-no* for *cā-no*, *prēces*, *mīhi* (or even *mīhi*), *rōsa*, *ūtinam*, and the like. I trust things are different now. It seems absurd to teach quantities by rote, and violate them in daily practice. Ear as well as memory should be pressed into the service.

At present, however, I wish to go a step further. Do any of us really observe quantity in reading Greek or Latin verse? Classic quantity, we all know, depended on time not on degrees of stress. All authorities agree as to this. A dactyl, for example, is defined by the best grammarians not as a foot of three syllables, but as a foot of four "times" (*συνεῖα, morae*). Its first syllable occupied two of these time-spaces, its second and third one each; and the whole foot therefore "divided evenly." Do any of us so read it?

The matter can be brought to a simple test. Let us beat time to our reading, as a child does to its music. A Greek dactyl answers precisely to a bar of common time in modern music; say, to a minim followed by two crotchets. Its first syllable must be prolonged over the time of two beats, just as when the child gives two beats to its minim. Counting the beats with outstretched forefinger—1, 2, 3, 4 to each dactyl or spondee—it will be easy for us to determine whether we really dwell on each long syllable for the entire time of two beats. Unless we do so, we are not reading by quantity.

My impression is that the reading of few will withstand this test. Most of us will discover that we have mistaken accentuation for quantity, and seldom or never have protracted the duration of a long syllable to double that of a short one. Habitually we read:

Arma virumque cano, Trojæ qui primus ab oris,

to the same time as

This is the forest primeval, the murmuring pines and the hemlocks.

That time, if I mistake not, is triple time with a strong stress on the first beat. When a child beats time to triple rhythm, it counts "one, two, three—one, two, three—one, two, three"—with a strong stress on the word *one*; but that stress does not alter triple time to common. Three crotchets with an accent on the first is by no means the same thing as a minim followed by two crotchets. Nor is our habitual rendering of hexameter rhythm the same as that expounded by ancient grammarians.

The value of this test is greater than some will suppose. In all verse time is a factor of incalculable importance. On it

mainly depends the character of a metre. It is true that, in English verse, syllables do not represent time; from this point of view it is correct to say that our syllables have no quantity. But we must not conclude from this that our verse bears no relation to time. Verse without time is about as conceivable as music or dancing without time. Ignored by most of our grammarians, time remains in our as in all verse the essential and fundamental element. And much becomes clear when we realize that the solemn and stately rhythm of Greek hexameter—a rhythm which possibly some of my readers may first realize in making experiment as above—was something widely different from the "jiggety jig" which we have associated with it. It is evident, for instance, that so-called "English hexameter" verse cannot possibly represent the music of its prototype. Apart from other differences, ably described by Calverley and others in well known papers, there remains a difference of temporal movement sufficient to produce total dissimilarity of general effect. Similar arguments may throw doubt on the correctness of describing our ordinary blank verse as iambic. In fact, once we learn to distinguish clearly between accentuation by stress and prolongation of time, much prosodical analysis and prosodical terminology will be probably pronounced suspicious or misleading.

An ingenious friend, indeed, argues that all such tests are needless. Good poetry, he says, can be enjoyed even when we do not understand its measure. "I read French verse," he declares, "with my British accent, and can tell what lines are good and what bad. I read Greek and Latin verse by accent instead of quantity, and their best lines produce due effect." Few of us, I imagine, will be ready to accept this way out of difficulties. Our reading of Homer may be a travesty, after all endeavours; it may be that to an ancient Greek it would sound as to us does the average Frenchman's reading of English verse. I am profoundly sceptical as to the possibility of reproducing by book-lore the spoken effect of a dead language. But at least it cannot be right to ignore the great principle which underlay all Greek speech, its prose as its verse, and formed the basis of its metre—the principle that in actual duration of utterance a long syllable took twice the time of a short.

Incidentally, the above test throws light on the question whether modern Greek speech sacrifices quantity to accent. Athenian authorities, I understand, do not admit that they say *ἄθρονος* [*sic*]; while accentuating the first syllable, they claim to sound an *omega* and not an *omicron* in the second syllable. But I think they would not pretend that they prolong the duration of that *omega* through two full "times." So far, therefore, it would appear that to this extent at least they do allow accentuation to overpower quantity.

THE CONFERENCE ON SCHOOL HYGIENE.

THE Conference organized by the Royal Sanitary Institute must be viewed as a preliminary canter in preparation for an International Congress to be held in London two years hence. The principal speakers, as well as the Council of the Institute, seemed to be feeling their way cautiously over unknown, and possibly dangerous, ground. The resolutions proposed were, for the most part, either withdrawn or amended into vague and pious aspirations. The word "hygiene" has such a wide connotation that a good deal of limitation and definition is necessary before a conference quite knows what are the problems with which it has to deal. Sir A. Rücker, who presided, was generally sympathetic, and said that at the new Goldsmiths' College hygiene would form an essential part of the educational course. This means the hygiene syllabus of the Board of Education, which was referred to by other speakers as quite inadequate.

On the second day Lady Londonderry wanted instruction in home management; Mr. A. H. D. Acland wished to sweep away four-fifths of the existing school examinations, and to forbid the announcement of school successes in the remainder. Dr. Clement Dukes asked that nine or nine and a half hours' sleep should be secured for children; but he had to be content with a general assurance that ample hours of sleep were essential. Resolutions were then carried in favour of hygienic specialists as school inspectors, and especially of women inspectors for dealing with infants and girls. To lessen the dangers of infectious diseases it was resolved that the lowest age of admission to school should be six years.

head masters to meet the wishes of the assistants—for, to men nursed in the old traditions, the proposal might seem to smack of heresy. It was recognized that the changes involved an amendment of the Endowed Schools Acts; but it was thought that the Board would be favourable both to this and to the proposal to afford an appeal to the Board against alleged unjust dismissal.

To the amazement of every one concerned, the Board, after a delay of many months, returned, in July of last year, a reply intimating that the desiderated reforms were impracticable. And, in spite of a subsequent deputation, grudgingly admitted, it seems clear that South Kensington is entirely disinclined to move in the direction of the *concordat*—though no formal reply to the deputation has yet been issued. The Board, it appears, desires to maintain the view of the Endowed Schools Commissioners, although this view is approved by neither schoolmasters nor by Education Committees, and although circumstances have entirely altered since the Commission sat, and several new factors have appeared.

Had the *concordat* been at once accepted, it is probable that the assistant masters, though inclined to be restive under the belief that too much power had still been left to the head master, would have abided loyally by its conditions. But it has been for some time evident to observers that a revolt has been gathering strength among assistant masters. There are two prevailing currents of opinion. There are those who say that at any seeming sacrifice of immediate gain the profession must show a united front; the real cleavage, argues this section, is between the professional and the administrative sides—blood is thicker than water, and assistants must range themselves with their titular chiefs. The other party, inclined to trust to the tender mercies of Local Authorities, is, it appears, gaining weight. The reasons for this are not far to seek. While the head masters are timidly making up their minds to a tardy instalment of long-awaited reforms, some of the Education Committees have made proposals which will go far to render the *status* of the assistant master a dignified and honoured one.

Probably every assistant master in England has read Dr. Snape's scheme for the improvement of secondary education; and other authorities, so far as they have expressed their views, seem no less sympathetic towards the natural desire of the assistant master to claim a worthy *status* for himself. At the recent meeting of the Association of Directors and Secretaries for Education, the President (Mr. Wilkinson, of Bolton) devoted part of his address to this question. Here are one or two short extracts:—

Surely the assistants in our secondary schools have their rights as to tenure as well as head masters! Is there no court of appeal? Is the head master's stable-boy to be in a better legal position than the responsible assistant in the secondary school? . . . Is he to be for ever without any remedy for a grievance which cannot be defended on any moral or sane grounds? . . . The head masters will be no weaker, but, on the contrary, considerably strengthened, if, by yielding to the legitimate demands of assistant masters, they thereby retain their allegiance. The question, then, we started with is answered; blood is thicker than water. The friend of the assistant master is the head master. But an alliance demands mutual forbearance and consideration; each side must enter into the feelings of the other.

QUANTITATIVE READING.

By T. S. OMOND.

IT may seem rash to assert that most of us neglect quantity in reading Greek or Latin. Knowledge of quantitative rules has been the hall-mark of English scholarship, a "false quantity"—within certain limits—the worst of blunders. But the limits have always been strangely narrow. The teacher who would be shocked if his pupil said *profugus* has himself no scruple in saying *profugus*; he probably says *oris* for *oris*, almost certainly *Italiani* for *Italiani*. Nor is it only unaccented syllables which are thus maltreated. In my young days, at any rate, it was common to hear *cay-no* for *cā-no*, *prices*, *mīhi* (or even *mīhi*), *rōsa*, *ūtinam*, and the like. I trust things are different now. It seems absurd to teach quantities by rote, and violate them in daily practice. Ear as well as memory should be pressed into the service.

At present, however, I wish to go a step further. Do any of us really observe quantity in reading Greek or Latin verse? Classic quantity, we all know, depended on time not on degrees of stress. All authorities agree as to this. A dactyl, for example, is defined by the best grammarians not as a foot of three syllables, but as a foot of four "times" (*σημεία, μορᾶς*). Its first syllable occupied two of these time-spaces, its second and third one each; and the whole foot therefore "divided evenly." Do any of us so read it?

The matter can be brought to a simple test. Let us beat time to our reading, as a child does to its music. A Greek dactyl answers precisely to a bar of common time in modern music; say, to a minim followed by two crotchets. Its first syllable must be prolonged over the time of two beats, just as when the child gives two beats to its minim. Counting the beats with outstretched forefinger—1, 2, 3, 4 to each dactyl or spondee—it will be easy for us to determine whether we really dwell on each long syllable for the entire time of two beats. Unless we do so, we are not reading by quantity.

My impression is that the reading of few will withstand this test. Most of us will discover that we have mistaken accentuation for quantity, and seldom or never have protracted the duration of a long syllable to double that of a short one. Habitually we read:

Arma virumque cano, Trojæ qui primus ab oris,

to the same time as

This is the forest primeval, the murmuring pines and the hemlocks.

That time, if I mistake not, is triple time with a strong stress on the first beat. When a child beats time to triple rhythm, it counts "one, two, three—one, two, three—one, two, three"—with a strong stress on the word *one*; but that stress does not alter triple time to common. Three crotchets with an accent on the first is by no means the same thing as a minim followed by two crotchets. Nor is our habitual rendering of hexameter rhythm the same as that expounded by ancient grammarians.

The value of this test is greater than some will suppose. In all verse time is a factor of incalculable importance. On it

mainly depends the character of a metre. It is true that, in English verse, syllables do not represent time; from this point of view it is correct to say that our syllables have no quantity. But we must not conclude from this that our verse bears no relation to time. Verse without time is about as conceivable as music or dancing without time. Ignored by most of our grammarians, time remains in our as in all verse the essential and fundamental element. And much becomes clear when we realize that the solemn and stately rhythm of Greek hexameter—a rhythm which possibly some of my readers may first realize in making experiment as above—was something widely different from the "jiggety jig" which we have associated with it. It is evident, for instance, that so-called "English hexameter" verse cannot possibly represent the music of its prototype. Apart from other differences, ably described by Calverley and others in well known papers, there remains a difference of temporal movement sufficient to produce total dissimilarity of general effect. Similar arguments may throw doubt on the correctness of describing our ordinary blank verse as iambic. In fact, once we learn to distinguish clearly between accentuation by stress and prolongation of time, much prosodical analysis and prosodical terminology will be probably pronounced suspicious or misleading.

An ingenious friend, indeed, argues that all such tests are needless. Good poetry, he says, can be enjoyed even when we do not understand its measure. "I read French verse," he declares, "with my British accent, and can tell what lines are good and what bad. I read Greek and Latin verse by accent instead of quantity, and their best lines produce due effect." Few of us, I imagine, will be ready to accept this way out of difficulties. Our reading of Homer may be a travesty, after all endeavours; it may be that to an ancient Greek it would sound as to us does the average Frenchman's reading of English verse. I am profoundly sceptical as to the possibility of reproducing by book-lore the spoken effect of a dead language. But at least it cannot be right to ignore the great principle which underlay all Greek speech, its prose as its verse, and formed the basis of its metre—the principle that in actual duration of utterance a long syllable took twice the time of a short.

Incidentally, the above test throws light on the question whether modern Greek speech sacrifices quantity to accent. Athenian authorities, I understand, do not admit that they say *ἀνθρώπος* [*sic*]; while accentuating the first syllable, they claim to sound an *omega* and not an *omicron* in the second syllable. But I think they would not pretend that they prolong the duration of that *omega* through two full "times." So far, therefore, it would appear that to this extent at least they do allow accentuation to overpower quantity.

THE CONFERENCE ON SCHOOL HYGIENE.

THE Conference organized by the Royal Sanitary Institute must be viewed as a preliminary canter in preparation for an International Congress to be held in London two years hence. The principal speakers, as well as the Council of the Institute, seemed to be feeling their way cautiously over unknown, and possibly dangerous, ground. The resolutions proposed were, for the most part, either withdrawn or amended into vague and pious aspirations. The word "hygiene" has such a wide connotation that a good deal of limitation and definition is necessary before a conference quite knows what are the problems with which it has to deal. Sir A. Rücker, who presided, was generally sympathetic, and said that at the new Goldsmiths' College hygiene would form an essential part of the educational course. This means the hygiene syllabus of the Board of Education, which was referred to by other speakers as quite inadequate.

On the second day Lady Londonderry wanted instruction in home management; Mr. A. H. D. Acland wished to sweep away four-fifths of the existing school examinations, and to forbid the announcement of school successes in the remainder. Dr. Clement Dukes asked that nine or nine and a half hours' sleep should be secured for children; but he had to be content with a general assurance that ample hours of sleep were essential. Resolutions were then carried in favour of hygienic specialists as school inspectors, and especially of women inspectors for dealing with infants and girls. To lessen the dangers of infectious diseases it was resolved that the lowest age of admission to school should be six years.

Sir W. Anson, who took the chair on the Thursday, recalled some of the speeches of Sir J. Gorst in saying that Lord Londonderry was inclined to attach much value to the hygienic branch of the Board's work. But Sir William did not forgo his usual caution in dealing with an audience of well meaning enthusiasts. He spoke particularly of the teaching of hygiene to young children, and pointed out that such teaching must be of the most simple character. "In the past," he said, "sometimes their instruction had been misleading, owing to the effect of strange ideas, couched in still stranger language, upon the youthful mind."

Sir Aston Webb would have the sun shine on all the rooms, and free circulation of air round the building. These are excellent proposals, but even the Board of Education in their much attacked building regulations do not ask for the impossible.

After deciding on Thursday that some of His Majesty's Inspectors should be hygienic experts, on Friday the Conference discussed a proposal that all schools should be placed under the control of the sanitary authority. In the end, both resolutions and amendments were discarded, and the question was referred back for the consideration of the Sanitary Institute. On the next day, of the two resolutions moved, one, dealing with the instruction in hygiene of teachers in elementary schools, was passed after being amended. The second, dealing with registration on "Column B," was thrown out as not being understood. Who does understand this puzzle?

We have said enough to intimate the many-sidedness of the subject. It is not a matter of wonder that the net results of the Conference should seem to be small. We will not, on that account, say that they are valueless. The actual vagueness that exists shows how necessary discussion is in order to clear the air. There are limitations in practice to the aspirations of the idealist. In addition to the many burdens already put upon them, teachers cannot become experts in physiology and hygiene. What would become of our poor innocent infants if such a result were reached? Some admixture of the quality known as common sense is absolutely essential. It is well that Prof. Findlay was present to represent the teachers' point of view.

Teachers should be able to read fatigue signs, and should learn from physiologists what amount of intellectual pressure is permissible; they should have their attention directed, if this is necessary, to questions of fresh air and ventilation. We look to governing bodies, enlightened or admonished by the Board of Education, to see to it that the buildings are suitable, and that the hours of study are not too long and do not include too much desk work. We will not admit the possibility of teaching to young children the "laws of hygiene" from a text-book. It is true that greater care has become necessary, owing to the comparatively unhealthy conditions of life in crowded centres of population. It is true that teachers are generally in advance of their times in hygiene, as in other matters; but in these things it is example, slowly working towards habit, that tells. Instruction from books is of little account. We all know, even doctors, that it is bad to remain for hours in vitiated air, and that a bedroom window should be open. We know the fact and usually rest content with the knowledge. Teachers also know that attendance at conferences is most fatiguing owing to the absence of ventilation in conference halls.

CORRESPONDENCE.

HOW OUR TEACHERS ARE TAUGHT.

To the Editor of The Journal of Education.

DEAR SIR,—At the beginning of this month I was asked to act as one of four examiners at an oral examination, the result of which was to partly decide the award of studentships offered by the Education Committee of a county within a hundred miles of London. The candidates were divided into two classes—those under fourteen years of age who are still attending school, and those over fourteen who are receiving instruction at centres and central classes for pupil-teachers, but who have not yet passed any public examination qualifying them for admission to pupil-teachership. My duty was to hear the candidates read aloud, and also to test their general intelligence and information by putting to them simple questions dealing with such subjects as current events, local history, natural objects and phenomena—possibly even with the examination room itself. I had also to look through and mark the English composition exercises of the older candidates. May I be permitted to give you, in a perfectly candid and unbiassed fashion, the opinion I formed of those candidates I examined, and of the

result of their training, so far as my conversation with them enabled me to judge of it? With regard to the composition of the older candidates, I was unpleasantly impressed by the very poor style in which they expressed themselves; a style so faulty, in fact, that I could only draw the conclusion that the writers must have the very slightest acquaintance with standard authors, and, moreover, that instruction in the really simple art of punctuation had been practically neglected so far as they were concerned. One candidate put a comma every time between the subject of a sentence and the verb, and another used "s" deliberately as the sign of the plural. But, though the remaining candidates did not commit these glaring faults, yet the general impression left on my mind, after looking over the papers, was that the composition of these senior candidates is poor in the extreme, and I feel quite sure that it would be difficult for one of them to express himself, or herself, correctly in an ordinary letter. The formation of a correct habit of expressing one's self seems to me of vital importance to those who intend to devote themselves to teaching others, and I am quite certain that children of any rank in life can be taught to form such habits if those in charge of them exercise sufficient care in such matters. With regard to the purely oral part of the examination, I did not have anything to do with the older candidates, but I only passed under review a selection of the younger ones. Most of those I talked to were the children of small farmers, and said they were in attendance at an elementary school. The passage selected for reading aloud usually furnished a starting point for this part of the examination, and our talk touched on a great variety of subjects, from points of interest in the neighbourhood of the candidates' homes to the war going on at present between Russia and Japan. In spite of some conspicuous examples of powers of observation and reasoning, my feeling at the end of the day was that I had just been passing in review a number of children whose minds were alert enough, but who seemed to possess little or no material on which to exercise their powers, and whose mental horizon was a terribly circumscribed one. They impressed me as the products of a machine-like routine; outside that routine they seemed to know practically nothing. Even when I reckoned on the routine, the result was not always satisfactory—as, for instance, when I talked to one fairly intelligent girl about a picture hanging in the room, and I learnt that she had never heard of Switzerland as a land of snow-covered mountains. Yet she learns geography! Another girl read aloud a description of Vesuvius in a state of eruption, as my fellow-examiner (Mr. M—) and I had previously ascertained that she had heard of Vesuvius. After the reading was over, however, though she could define Vesuvius as "a burning mountain," she was unable to answer Mr. M—'s question: "Well, what does it burn—coal, gas, or what?" Several candidates had never seen a map of their native county, and others seemed to have no idea in which direction London lay. One little girl—but she was an extreme case—had been more than once to a seaside town close to her home, where there are a celebrated castle and a still more celebrated cliff, but she seemed to be ignorant of their existence even.

I feel confident that a similar want of general information, outside ordinary school subjects, would not characterize children of the same class educated in the public schools of Germany, Switzerland, or Norway. With regard to accent in reading—a point to which the Education Committee for whom we were examining called special attention—a provincial twang was very conspicuous; but I think that a better class of teacher might effect a great deal towards helping children gradually to rid themselves of this. So long as they hear in school the same accent and the same mispronunciation of words as they must, generally speaking, hear at home, for so long, of course, will pupil-teachers perpetuate a slovenly and illiterate way of speaking and reading. I dare say the pronunciation of certain vowels might never be quite pure in every instance: that, perhaps, is a result to be expected, more or less, from the nature of the case. But the letter *h* initially ought certainly to be a fixed quantity, and it most certainly was not on the occasion which I am now describing. I am afraid that I have dwelt somewhat on the dark side of the picture, but I must not end without saying that, in spite of the many deficiencies to which I have called attention in this communication, I nevertheless retain a very fair impression of the general capacity and intelligence of the majority of the junior candidates whom I

examined. They did not strike me as being at all deficient in mental power, but as being in woeful want of correct information about common things. It is a fact that one candidate had not the slightest idea of the reason for stamping letters. I am sure that more scope must be given in the future to teachers in elementary schools, so that they may be able to devote themselves specially to helping those under their care to become generally well informed. I say "must" advisedly; for, should nothing be done in this respect, and if the candidates I interviewed are to be taken as typical examples of all that we in England can do in our elementary schools, then I consider the prospect for future generations, and for our country as a whole, to be a very gloomy one.—Yours faithfully,

M. T. HINDE,
English Mistress at the
Simon Langton School for Girls, Canterbury.

"THERE WAS NO ONE HURT."

To the Editor of *The Journal of Education*.

SIR,—Can some English scholar explain the use of "there" as employed in the above example? English grammars generally explain "there" as really an adverb of place, and the sentence as equal to "No one was hurt in that place." This explanation seems to suit neither the sense nor the construction—to have been evolved rather than ascertained by inquiry into earlier forms.

The following seem to me good enough reasons for supposing "there" to stand for "it"; but it would be interesting to have them set right or approved by others. In Old English we find impersonal verbs without a pronoun subject: "Me gemæth," "I dreamed." We also find: "Thær was gebroht win," "Wine was brought." But even then "thær" was often used for "hit" ("it"), as in "thæron," "on it." In Middle English "it" was introduced, as in "It is na tung ma tell," "There is no tongue may tell."

I suggest therefore that from the first "there" was equivalent to "it," and never had any locative force. Consequently "there" should be considered as a "preparatory it." This contention is borne out by comparison—

(a) With the use of "y" in French.—"Y" was first used in "il y a" in the sixteenth century. On the other hand, "il" was not originally used in "il y a." Even now "tant y a que" requires no "il." In French therefore "il" and "y" have much in common.

(b) With Italian.—"Non c'è (or v'è) pericolo," "There is no danger," where "ci" and "vi" = "there."

(c) With Dano-Norwegian use of "det" ("it") and "der" ("there"), which are used almost indiscriminately as subjects to impersonal verbs and expressions.—We have: "Det er varmt," "It is hot"; "Der staa skrevet," "It is written"; "Det fortalles," "It was rumoured"; "Der fortaller," "It is rumoured."

The point is a small one; but it is not without interest for those who have to teach analysis.—Yours, &c.,

G. H. CLARKE.

Hull, February 15, 1905.

PROPOSED REFORM OF THE CAMBRIDGE LITTLE-GO.

To the Editor of *The Journal of Education*.

DEAR SIR,—The proposals of the Studies and Examinations Syndicate in regard to certain changes in the Previous Examination are to be submitted to the Senate on March 3 and 4. Members of the Senate may record their votes on either of these days between 1 and 3 or between 5 and 7 p.m. The controversy has chiefly turned on the proposal to abolish compulsory Greek, and it is mainly on this question that the issue will be decided.

The Secretaries of the Committee in support of the recommendations of the Syndicate will be glad to hear from non-resident members of the Senate who have not already intimated their intention of supporting the proposed reform. It is believed that amongst resident members of the Senate a majority will vote in favour of the new scheme, but the decision is largely in the hands of non-resident voters. As it is proposed to issue a final list of supporters shortly before March 3, it will be a convenience if additional names are sent to A. C. Seward, Emmanuel College, Cambridge, as soon as possible.—Yours faithfully,

HENRY JACKSON, Trinity College,
Chairman of the Committee in support of the recommendations
of the Studies and Examinations Syndicate.

JOHN PEILE, Master of Christ's College.
V. H. STANTON, Ely Professor of Divinity.

R. VERE LAURENCE, Trinity College

H. RACKHAM, Christ's College

A. C. SEWARD, Emmanuel College

Honorary Secretaries.

Cambridge, February 23, 1905.

COLONIAL AND FOREIGN NOTES.

FRANCE.

Sainte-Beuve attained to the honours of a centenary on December 23, last year. Upon such an occasion it is customary to look afresh at a man and to contemplate his work from every possible point of view.

Not unnaturally the pedagogues would fain count the great critic among themselves. He, for his part, repudiated all claim to speak with authority about their work. "Il y a longtemps que l'on discute sur l'éducation, et l'on en dispute encore," he wrote once somewhat wearily; he would hold aloof from the subject partly because he disliked polemic, and partly by reason of the exalted idea he had formed of the talents and virtues necessary for the instruction of youth. Yet it was impossible for one who discoursed of Rabelais, Fénelon, Rousseau, and Madame de Rémusat to withhold himself from all consideration of educational problems, and the works of Sainte-Beuve form a store-house from which may be drawn not a complete system of education, but an abundance of wise and suggestive remarks about it. Read the "Causerie" on Charron: "Le tout est de distinguer entre la bonne instruction et la fausse. La véritable est celle qui ne s'applique point extérieurement et machinalement à l'esprit, qui ne lui impose pas des formes une fois trouvées, et par lesquelles on se croit dispensé du ressort intérieur et de l'invention naturelle." The writer of such words as those had penetrated to the inmost heart of education with an insight given by genius alone. These again flowed from the pen of one who had a true sympathy with childhood: "Commençons l'enfance par quelques heures d'abandon et de simple causerie enfantine; commençons la semaine par un dimanche." Whilst religious warfare is still raging about the school, it may be interesting to know how he conceived the State should stand towards such conflicts: "Je dirai plutôt que la disposition vraie d'un Gouvernement dans ces sortes de questions devrait être une équitable et suprême indifférence, une impartialité supérieure et inclinant plutôt à la bienveillance envers tous, de manière toutefois à maintenir et à réserver les libertés et les droits de chacun." In short, if Sainte-Beuve may not be reckoned to the pedagogues, he divined much of the best that they have to say, and illumined their sphere when by chance he approached it.

The welfare and success of a school depend, in general, on a close attention to details. Important among small, but weighty, matters is the length conceded to the mid-day break. It is one of the things in which local conditions are determinative; but the substance of a French official circular recently issued may be of service. Complaints have been made, says the Minister of Instruction, that in some schools an interval of only one hour has been allowed at mid-day, and that this is insufficient alike for day boys and for boarders. Many Committees on School Hygiene, and, quite lately, the Permanent Commission on Tuberculosis, have urged that, if work goes on until twelve o'clock in the morning, it should not be resumed until two in the afternoon. Accordingly he desires that *provisseurs* and principals will arrange their time-tables so as to leave a break of two hours in the middle of the day. To us the duration of afternoon school seems to be a factor in the case. Teaching an overfilled boy for a long summer afternoon is a task that many are glad to have behind them as soon as possible.

M. Gaston Varenne, of the Lycée Condorcet, contributes to the *Revue universitaire* an article on "The Place of Grammar in the teaching of Modern Languages." For some years, he reminds us, fierce conflicts raged about the subject, grammar being for some a Bastille to be demolished; whilst others made it a refuge and fortress to be defended at all costs. The question that divided the two parties was: Ought the teaching of languages to be *inductive* or *deductive*? This is an idle dispute about words. It is precisely in the teaching of grammar that the two methods should be reconciled and should supplement each other. We should lead up to grammar inductively and apply its results deductively. The study of grammar ought not to be neglected in the teaching of languages, but it ought never to be the point of departure. Grammar must confine itself to stating to the pupil facts that he knows already; he ought, as it were, to *possess his grammar before learning it*. Correctness he should acquire from the outset by usage and practice. Example, under all circumstances, should come before precept.

So far M. Varenne on the general position. For his application of principles to method we must send our readers to the article itself—it is in the number of the *Revue* for January 15. Since we cannot condense it with justice here, we leave the subject for another. Some amusement has been caused by the will of Mlle. Lassence, who, desirous of emulating American beneficence to learning, has left property to establish on her estate at Mare-aux-Moines (Seine et Marne) a "Université des Hautes-Études." The Ministry, whilst accepting the legacy, directs that the sum bequeathed shall be left to accumulate in the three per cents. for

ninety-nine years; whence one is disposed to infer that the wealth of the testatrix was not in proportion to the grandeur of her intentions. Speculation is naturally rife as to what a University will be like in A.D. 2004. Quite unselfishly we suggest that the institution should be organized to provide chiefly for Englishmen engaged in the study of French.

Reading the educational journals, you might suppose that modern languages nowadays were to be acquired solely for commercial purposes. It is partly in protest against this view that a new step has been taken. At a meeting presided over by M. Paul Boyer, Professor at the School of Oriental Languages, there were voted the statutes of a Society for the Study of Modern Languages and Literature not from the practical, but from the scientific, point of view. Its object is to bring together all who are working upon the history, philosophy, literature, or art of the civilized countries of Western Europe (France excepted). England, Germany, and Scandinavia will be its special domain.

ITALY.

The secondary teacher in Italy fares little better than in England; as to salary, since his maximum is £120 a year, he is rather worse off. But Italian teachers have something of solidarity, and can exercise influence by threatening to cast themselves into the arms of the revolutionary party. Hence they have been able to stir the Government to action in regard to secondary education, and Sign. Orlando, the Minister of Public Instruction, has introduced a Bill to deal with the question. Some of the teachers are to benefit under it. In Italy there are many private schools conducted under the authority of the State. These schools are to be empowered to raise their fees; in return for which they are to pay their teachers the same commencing salaries as those in State schools receive; and four times in a teacher's career they must give him an increase of salary equal to at least a tenth of his minimum. State teachers get nothing, on the ground that at their Congress they declared "any exclusive amelioration of our condition would be inopportune so long as the door is not shut against intrigue." We get a hint of what kind of intrigue is meant from another clause. No person is henceforth to be admitted as a teacher unless he gains a place on a list drawn up by a Commission; and appointments are to be made in regular order from that list. On this Commission teachers are to be represented by four elected members, five others being nominated by the Minister. As to promotions, two-thirds must be by seniority; and no teacher may be promoted on two consecutive occasions by selection. Especially desirable posts will be filled no longer by the Minister's nomination, but according to the results of an examination held every other year. With regard to fixity of tenure, the provision is somewhat elastic. Teachers are only to be retired or removed at their own request; or if the exigencies of the public service demand it. In the latter case, the opinion of the Higher Council of Public Instruction is to be taken. For head masters are to be substituted teachers elected by their colleagues for three years and relieved of some of their ordinary duties. The system of inspection is to be developed, and special cases for inquiry are to be investigated by special means.

UNITED STATES.

"Teaching the Indian child to speak English forms the basis of all efforts to educate him," says Miss Estelle Reel, the well known and self-sacrificing Superintendent of Indian Schools. Inexperienced readers may wonder how teacher and child communicate; experienced will know that it is by means of things. Thus, a table will be covered with familiar objects. Fences are represented by sticks, trees by twigs, buildings by little blocks of wood; whilst roads, creeks, and ditches are traced in sand, and toy animals rest on mimic fields. Then the teacher, holding up, for example, a toy horse, pronounces the word "horse" and encourages the children to repeat it after her. Next she makes the toy horse jump, and gives the class the sentence: "The horse jumps." These words are spoken in a loud, distinct voice, recited again and again by the class in concert, and then by each child alone. Lastly, the word "horse" is traced in sand, and there resolved into its elements or letters. Charts, too, may be used containing lists of articles employed in laundry, kitchen, or dining-room; but a plate or drawing proves less effective than a model. Another system is for the teacher to acquire a little of the Indian's speech. The sky above him is *mah-pi-ya*. Having learned this, she bids him call *mah-pi-ya* "the sky." It is all very interesting; for it is practically the difference between the New Method of teaching modern languages and the old method by translation. We find it stated of a teacher who uses what we may call the rational system that her pupils can speak more and better English in three months than many in other schools learn in twelve.

"No," said a teacher, decisively, "it does not pay to be a school

Does it pay?

teacher. Any man who has brains enough to earn twelve hundred dollars a year by teaching could make twelve thousand by doing something else."—So does a writer in *Leclie's Magazine* introduce an article on a very old subject. He points to a phenomenon with which we are familiar in England—the man who teaches "until something turns up." At Princeton last year out of a class of two hundred and eighty-three graduating only twelve expressed an intention of taking up teaching as a profession; but it is most probable that a large number of them will teach for a few years. So, as to those who took their degrees from another Eastern University fifteen years ago, of those who taught in the first year after graduation, only 35 per cent. are teaching now. Both in America and in England men fall out of the ranks because it is unremunerative to remain in them, although at first money may more easily be got by teaching than from the exercise of any other profession. We have before pointed out that *training*, whatever other benefits it may confer, *serves as a test of earnestness*, and excludes from the school the waiters on Providence. As to the question "Does teaching pay?" readers will anticipate our answer: "Not perhaps in money, but in the things that money cannot buy." Yet the teacher is entitled to demand such a salary as will enable him to discharge his social obligations and to pursue his work immune from sordid anxieties. Those States prosper best in which he gets this immunity.

We spoke lately of fraternities or societies in secondary schools for boys. It appears that girls in like manner have their "sororities"—the word being as unknown to Dr. Johnson as the thing would have been odious. A few months ago a Committee of School Principals reported on the influence of both kinds of association, after having conducted an inquiry by the usual means of the *questionnaire*. Parenthetically, we observe that these *questionnaires* must be getting as great a nuisance in America as are in England the editors' letters to head masters asking "Are our boys deteriorating?" "Ought they to sew on buttons?" and "Do your masters keep tuckshops?" As to the American school societies, teachers are sometimes admitted to them; but "it is a rather noticeable fact that sororities are more anxious to take in women teachers than fraternities are to receive men teachers." Whenever a society can afford it, a "chapter-house" or a set of rooms is rented. The character of the meetings held proves to be very various. One sorority is reported as doing sewing, needlework, and cooking at its meetings. Whilst the conduct of the girls is found to be, as a rule, perfectly proper, and some of the boys take a pride in keeping their meetings respectable, in a few cases smoking, drinking, and card-playing have been indulged in by boys, and horseplay by girls. The course advised by the principals reporting is generally unqualified abolition; whereas a few would be willing to see the clubs maintained under supervision. On the other hand, parents are usually indifferent, but sometimes positively favourable to them; as to which a principal pungently remarks: "Parents in general have no sense where children are concerned." The societies are of interest for us as representing a feature of life in American schools that has, so far as we know, nothing like it in English.

There is much talk about the "Batavia system" of instruction, and for the benefit of the uninitiated we explain it as well as we can in a few lines. Conceive a school-room in which there are from fifty to eighty children. Two teachers are employed in it. One of these conducts the lessons, maintains discipline, keeps the records, and attends to the general business of the school; the other, co-ordinate with the class-teacher, uses all her time in working at a desk with individual pupils who have been found to be backward or, for any reason, are falling behind in the class. By this method the two teachers work as one. If there be only thirty or forty pupils, one teacher divides her time, employing half for class and half for individual instruction. It seems very simple, does it not? Yet the system is said to yield astonishing results. At least, at Batavia (New York), where it has been tested for six years, no voice is heard except in approval, and it has been introduced into about twenty cities of the United States and Canada.

CAPE COLONY.

The official *Education Gazette* calls the attention of managers and teachers of poor and small public schools to the opportunities offered them of providing their schools with libraries at a nominal cost. The Department offers to present to such schools, free of cost, a library of sixty volumes in uniform style of printing and binding, on the following conditions:—(1) that there is a reasonable assurance of the permanence of the school; (2) that a satisfactory lock-fast bookcase or cupboard is available for the safe keeping of the books; (3) that the gift is recommended by the Inspector.

The *Gazette* also supplies us with an illustration of a fact that we have often thought curious. When we extend our Empire we seldom think imperially of our educational duties. We are far from speaking unkindly

of the work of missionaries. We consider it strange, however, that they should be left to represent the State in respect to an important part of its proper activity. In Cape Colony there is often better provision in the outlying "Territories" for native than for white children, even where the district is practically a white man's country. The paragraph that we quote explains the situation: "It is instructive to compare the modes in which schools for aborigines and schools for Europeans originate. For the purpose of providing education for European children there is at present no permanent local organization whatever. In the case of aborigines there are actually competing organizations, every missionary church being bent on the establishment of schools. So zealously, too, is this work pursued that schools are opened whether a Government grant be available or not. In one Inspector's circuit where there are 114 aided schools, there are as many as 40 unaided, the latter being managed in the main by the same missionary superintendents as the former. The European population, being small and scattered, needs greater guidance and assistance to secure education facilities, but receives less."

UNIVERSITIES AND SCHOOLS.

OXFORD.

In the absence of any large or burning question, such as the proposals of the Cambridge Syndicate for the reform of the "Little-go," which will be decided at the beginning of March, a certain amount of public attention has been directed to the offer made by the well known Mr. Beit, of South Africa (and Park Lane), to endow the University with funds for the promotion of the study of Colonial history. Probably those of your readers who are interested in the proposal would be glad to know more exact details, which are as follows:—

1. The annual income of the foundation is to be £1,310. It is (very judiciously) offered at first for seven years only; but, if before the end of that time it appears to the Council, after consulting the Electoral Board who appoint the Professor, that it will be of advantage to the University to continue the benefaction, the endowment will be made permanent by the investment in Consols of a sufficient sum to produce £1,310 per annum.

2. The foundation will provide for a Professor of Colonial History; assistant lecturer in the subject; an annual prize of £50 for an essay on some subject of colonial history, and the payment of examiners; the purchase of books to the value of £50 bearing on the study.

3. The offer is subject to conditions which may be briefly summarized as follows:—the Professor shall reside, and shall give (besides the ordinary lectures) at least one public lecture each year: the subject shall include (a) the history of Imperial policy towards the colonies, (b) the detailed history of the separate self-governing colonies (including America before the independence), and of all British possessions, except India and dependencies: the special subjects in the Modern History School shall include a subject connected with colonial history.

These provisions were embodied in a series of Decrees, proposed to Convocation on February 14, which allocated various sums to the different portions of the offer as follows:—

For the Prize (annual)	£50
„ Examiners for the Prize	10
„ Lecturers	300
„ Books	50
Leaving for the Professor	900

It is tolerably obvious, from the sum offered, that the details had been carefully considered by the founder, probably by informal communication with Oxford, before it was made public. However that may be, the offer, with the above scheme formulated by Council, was approved by Convocation (on the above-mentioned date) without opposition.

Doubts have been expressed in some quarters as to the wisdom of the University in accepting an offer of this kind. It is very likely true that in some of the American Universities the reliance of the authorities on the bounty of living wealthy donors may have been accompanied by certain drawbacks. It may be the case that elsewhere, in certain new foundations, the authorities have been tempted away from their proper duties to "captation" of possible benefactors; and even that cases have arisen where the need of propitiating such persons has interfered with the freedom of the investigator. But, however desirable foresight and caution may be in these matters, it seems an extravagant suggestion that there is any such danger to be feared in the English Universities. The recent history of theological study in England, where much weightier influences might be feared than the prospect of attracting the rich founder, is entirely reassuring on such a point.

The organization of military instruction at Oxford, in view of the new departure whereby commissions are to be assigned annually to University students, is engaging the steady attention of the recently

Military Instruction.

appointed Delegacy. Courses of instruction are already arranged in Military History and Strategy, in Military Engineering, in Military Topography, and in Tactics, Military Law, and Administration. The candidates must be over twenty and under twenty-five when they present themselves for nomination; they must have qualified for a degree, with a special qualification in mathematics for those who aim at the Royal Artillery; must have been "attached to a Regular unit" for twelve weeks, and obtained a certificate; and must have passed an examination (held twice a year) in military subjects. The adaptation of the special arrangements for the military course to the condition of the ordinary studies has been carefully prepared: e.g., Artillery candidates are advised to read for Mathematical Moderations; the "Military History" special period is now included in the History School subjects; and Military Law, History, Strategy, &c., can be offered in the Final Pass School, so that three out of five of the subjects required in the Military examination can be taken for the Pass degree.

The report for 1904 of the Geography School has just been issued (February 21, *Gazette*), and is interesting for the full details given of the work done. In the past year the students' numbers have steadily risen from 107 to 146, of which about one-sixth were women. In two years the numbers have about doubled; and they include a few students from France, Germany, Italy, Egypt, and the United States. Besides attending lectures (of which twelve courses were delivered in the year), the students write periodical essays for the Reader and Lecturers; and practical instruction courses, a *seminar* for discussion, and excursions for practical field work give further opportunities for profitable study. There is also a holiday course in August, attended by thirty students, with a large and varied programme of lectures, besides field-surveying, practical map-making, excursions, &c.

I have noted from time to time the various items of University legislation which have extended University privileges to students from foreign and colonial seats of learning. One such small item appears among recent Decrees of Convocation, viz., the admission of students of the University of Manitoba (Winnipeg) to the privileges of the statute dealing with "Colonial and Indian Universities."

The following deaths have been recorded in the past month:—The Right Rev. Dr. Lewis (Worcester College), Bishop of Llandaff, aged eighty-three; Rev. A. J. Miller (Exeter), Vicar of St. Frideswide, Oxford, aged fifty-two; Dr. J. C. Wilson (brother of the late Warden of Keble College), Lecturer in Jurisprudence to several colleges, Alderman of the City of Oxford.

In last month's letter the name of the late Mayor of Oxford was printed "Caphouse" instead of "Taphouse"; and it was some time last year, not "some years ago," that he received his honorary M.A. degree. We have to thank Mr. C. J. Jerram for the correction.

CAMBRIDGE.

Since my last letter the term has divided. This very simple and ancient phrase means that we are half way through the term, and that college lecturers have received the lecture cards of out-college students, and that the end is in sight. But there is much to happen first.

In the meantime we have had a little controversy on the Library—a most fruitful ground of controversy it always is. This time what we could not be clear about was the meaning of the word "library." Is a

"library" a building in which books are stacked for preservation or kept for use, or is a "library" a collection of books which may be divided over *n* rooms in *n* buildings? We decided, after writing and reading a number of fly-sheets, that a library is a collection of books, and that the University Library is the collection of some half a million books owned by the University and not by the Library Syndicate. In plain terms—now that the main principles are clear—we decided by 80 votes to 63 that, under proper conditions and subject to the approval of the Library Syndicate, certain books bearing on law may be kept in the new Squire Law Library, a building some ten minutes' away from the University Church. It is with some regret that we shall see a part—though a very small part—of our books housed under a separate roof, but want of space would, in any case, have made this necessary in the long run, and there is the prospect of a greater usefulness of the books under the new arrangement.

On getting back to our rooms after the Library vote we received another fly-sheet on Greek, and Greek has since been our one interest. The Syndicate in charge of the question has reinstated the option of set books

in Greek and Latin, in deference to widely expressed opinion, and has reduced the amount of grammar required of candidates. This is a change which should gain for the proposals a good many doubtful votes. A paper on logic has been added to the alternatives in Part III., while freedom to do a Greek Gospel instead of an English Gospel and the English "Acts" has also been conceded—both distinct improvements.

The complaint is now made that the Gospel is being thrust into the background. Logic, however, was in the old Little-go; and such knowledge of undergraduate nature—indeed, of human nature—as I have acquired leads me to prophesy that far more men will take the Gospel

than will ever take either logic or inorganic chemistry—the particular bugbear of some querulous people. We all like “soft options.” It is, perhaps, not too uncharitable to say that this cry of “Church in danger!” means just as much on this occasion as it usually does. It is a pity that it should have been raised, for it adds an element of irritation to a situation which is painful enough to friends who feel strongly, but on opposing sides.

The voting will be on Friday and Saturday, March 3 and 4, from 1 to 3, and from 5 to 7 p.m. It is desirable that all who sympathize with Liberalism in education should try to come up and vote *placet* for the proposals. Some of the colleges are entertaining at lunch on those days all their members who are voting, irrespective of the side on which they vote.

Mr. Frank McClean has left the Fitzwilliam Museum a remarkable collection of MSS., early printed books, and objects of art. The MSS. are two hundred in number, and the exhibition of them in the Museum the other day

was extremely interesting. They are in Greek, Latin, Irish, and a great many other tongues, and the illuminations are very beautiful. The objects of art in some cases furnish the Museum with fine examples of whole classes of things hitherto unrepresented. It is a splendid bequest, and a great example to all collectors.

Two commissions in the Indian Army will be added each year to those already allotted to the University, bringing the number of commissions in all the forces up to fourteen.

Prof. Boas is giving his Clark Lectures on English Literature at Trinity. His subject is “The Academic Drama.” He has given two lectures this term on “*Pedantius* and other Cambridge Comedies,” and “*The Parnassus Plays*.”

The subject for the Seatonian Prize Poem (open to all Masters of Arts) is “*St. Columba*,” and exercises should be sent to the Vice-Chancellor by September 30. The same subject was set some fourteen years ago for the Chancellor’s Medal for English Verse. It would be interesting if the successful poem of that day should, with or without revision, win a second prize. It was quite good enough. However, when one remembers how many prizes there are and how few subjects, one ceases to be inspired at coincidences.

The sudden and untimely death of Mr. A. Austen Leigh, Provost of King’s, deprives his College of a genial and capable Head and the University of an administrator who worked quietly but indefatigably in many good causes. The stately funeral service in the great chapel on February 1, attended by hundreds of resident and non-resident friends and colleagues, bespoke the widespread mourning his loss has caused.

On January 28 a Latin address of congratulation on his eightieth birthday was presented by a large number of pupils and admirers to Prof. J. E. B. Mayor, who has held the Chair of Latin since 1872. Cordial speeches were made in St. John’s Combination-room by Sir R. Jebb, the Master of Trinity, the Vice-Chancellor, and others. The veteran professor made a vigorous reply, in Latin and English, in which he touched *more suo* on many things, old and new. The Master of Clare, who examined him for his Tripos in 1848, was present to do him honour.

A sum of £630 contributed as a memorial of Sir Leslie Stephen has been offered to the University for the foundation of a Lectureship in Literature, on the model of the Rede Lectureship.

Scholarships and Prizes awarded: Burney Prize, L. Alston, B.A. (Christ’s); Craven Scholarship, R. L. G. Butler (Trinity); Battie Scholarship, H. Mattingly (Caius); Browne Scholarship, P. J. Pearce (Trinity); The Chancellor’s Classical Medals—(1) K. J. Freeman, B.A. (Trinity), (2) F. A. H. Atkey, B.A. (Pembroke), and C. E. Stuart (Trinity), equal; Hulsean Prize, E. A. Edghill (King’s); Smith’s Prizes, H. Bateman, B.A. (Trinity), and P. E. Marrach, B.A. (Trinity); Isaac Newton Studentship, F. J. M. Stratton, B.A. (Caius).

Appointments: I. L. Tuckett, M.A. (Trinity), Additional Demonstrator in Physiology; the Rev. H. J. C. Knight, M.A. (Corpus), Hulsean Lecturer; H. Jackson, Litt.D. (Trinity), Fellow of Winchester College.

MANCHESTER.

Two very interesting events have signalized the past month at the University—the unveiling of the Withers Memorial, and the opening of the Public Health Laboratories. The memorial has taken the form of a bronze tablet in the Whitworth Hall, bearing the words: “In remembrance of Harry Livingstone Withers, first Sarah Fielden Professor of Education. 1889 to 1902”—and a quotation from Plato’s Republic in the original Greek, selected by Prof. Alexander, who was so largely influential in connexion with the foundation of the Fielden Chair. The tablet was presented to the University on behalf of the subscribers by Mr. P. A. Barnett.

The new Public Health Laboratory was opened on January 27, by Mr. W. J. Crossley; the Chancellor of the University (Earl Spencer) presiding. A special tribute was paid to the devoted labours of Prof. Délepine, to whose work the establishment of the Laboratory is so

largely due. Later in the afternoon a Degree ceremony was held at the University. In the course of his opening remarks Earl Spencer referred to the special pleasure it gave him to be present on account of the fact that he had himself been averse to the division of the Victoria University. The degree of D.Sc. was conferred upon Prof. Calmette, of Lille, Prof. Perroncito, of Turin, Prof. Salmarsen, of Copenhagen, and Commander Scott, R.N., of the “*Discovery*.”

As already announced in this column, the work hitherto done as Lecturer in Economic History and Commerce by Mr. W. G. S. Adams has been taken by Mr. H. O. Meredith, M.A., Fellow of King’s College, Cambridge. Mr. Adams’s work as Extension Secretary is taken by Mr. S. P. P. Waterlow, B.A., formerly attached to the English Embassy at Washington.

At the meeting of Convocation it was unanimously decided that in future graduates shall become qualified for registration as members of Convocation immediately on receiving their degrees. Convocation also urged that increased facilities should be given for proceeding to the higher degrees in Law.

The Government grant to the University of Manchester has been increased from £3,500 to £6,000.

This term Prof. Sadler is in residence and is giving two courses of lectures open to outsiders—one on “*Representative Educational Leaders*,” the other (which commences on March 1) on “*The Organization of Secondary Schools for Boys and Girls*.”

At a debate at the Union on Mr. Balfour’s fiscal policy, opened by Mr. Joynton Hicks, who is opposing Mr. Winston Churchill, the narrow majority of one was recorded for the Government. A college song, with music by Dr. Carroll, is published with the current number of the *University Magazine*.

At the Grammar School the celebration of the centenary of the birth of Harrison Ainsworth has naturally turned attention to that writer’s graphic description of his old school in “*Mervyn Clitheroe*.” The school library contains among its treasures the complete M.S. of the “*Preston Fight*.” By the appointment of Archdeacon Diggle to succeed Dr. Bordsley as Bishop of Carlisle, an Old Mancunian replaces an Old Mancunian. A similar change has just taken place in the captaincy of the Oxford University La Crosse Team, while another *alumnus* of the school has been appointed Lecturer in Mathematics at King’s College, London. Mr. Bateman, the Smith’s Prizeman, was also a scholar of the school.

The series of school lectures for the term was opened by Lieutenant Armitage, who was second in command on the “*Discovery*” Antarctic Expedition. Among the other lecturers the name of Archdeacon Wilson is one that will, we fear be very much missed in future. The removal of Archdeacon Wilson, consequent on his appointment to a canonry at Worcester will create a gap in the ranks of educational leaders in this district which it will be very hard to fill.

At the High School for Girls the Old Girls’ Association has been addressed by Miss Burstall on the subject of “*The Careers open to Women*.” The opening of the new Botanical Laboratory and Conservatory by the Lord Mayor and Lady Mayoress of Manchester is announced for March 3.

The annual meeting of the Association of Technical Institutions, which has taken place this year at the Manchester School of Technology, will no doubt be fully reported elsewhere. The paper on “*The Co-ordination of the Work of Evening Continuation Schools and Municipal Technical Institutions*,” by Principal Reynolds, M.Sc., has since been published in pamphlet form. It has been found necessary to apply for sanction to borrow an additional £100,000 in connexion with the erection and equipment of the Manchester School of Technology. Up to January 31, 1905, the total payments on these accounts amounted to £337,564. In connexion with the Municipal Evening School of Commerce, an interesting publication has recently sprung into being, entitled the *Students’ Magazine*. The first two numbers give good promise of the success of the venture.

At the meeting of the Education Committee the grants in aid to institutions in the City were confirmed and continued. These include £4,000 to the University, £600 to the Grammar School, and £300 each to the Girls’ High School and the College of Music. Miss Burstall called attention to the decrease in the return of children maintained in industrial schools, which she regarded as evidence of the work done by the School Board.

The Salford Education Commissioners, who have been giving some attention to the question of cigarette smoking, have adopted the resolution suggested by the Elementary School Committee asking teachers “to do all they can, both by precept and example, to wean boys from the evil habit of cigarette smoking, and to refrain themselves from smoking in the vicinity of the schools.”

A curious protest has been made to the Manchester Education Committee by the shopkeepers in the vicinity of the Central Municipal Schools against the schools having the “*facilities*” of a sweet shop. They point out that such an undertaking “is entirely outside the work of education, and injurious to us as shopkeepers and ratepayers.” The annual report of the Manchester Schools’ Savings Banks shows a total of 1,123,554 transactions during the year, resulting in a deposit of nearly £37,400.

The authorities at the Pupil-Teachers' College have issued a set of notes entitled "Suggestions to Pupil-Teachers on Learning to Teach." About 700 elementary-school teachers are attending the lectures on improvements in the teaching of drawing given at the School of Technology on Saturdays.

At the annual meeting of the Teachers' Guild Mr. Paton, in closing his year of office as President, described the Guild as the only society which "magnifies the office of teacher, and represents the solidarity of the profession."

The adult school movement is attracting much interest at present in Manchester. The report of the Education Association shows that the Committee have under consideration the anomaly that "the amount of time given in the municipal provided schools of Manchester, and of Salford, to Scripture teaching and religious exercises is far in excess of the time given to the same subjects in non-provided schools." An interesting correspondence on the subject of "Religious Instruction in Schools," opened by Mr. C. S. Roundell in the columns of the *Manchester Guardian*, has drawn from Archdeacon Wilson two letters, one, of an earlier date, addressed to the Vice-Chancellor of the University. "I believe," writes the Archdeacon, "that the great majority of Churchmen, clerical and lay, would surrender denominational teaching in school hours, and a majority in management, if they could obtain any security that the Bible shall continue to be taught, and taught by persons qualified in knowledge and disposition."

The Child Study Association have held a special meeting to consider a number of recommendations which they propose to submit to the local Education Committees on the subject of the teaching in the infant schools. The recommendations are in the direction of removing the "three R's" from the teaching of the very young children, and raising the age for leaving the infant schools.

The newly formed Classical Association, under the leadership of Prof. Conway, has now enrolled about a hundred and twenty members. The second meeting, held at the Rylands Library to inspect the early copies of the classics treasured there, was a great success. A special Excavations Committee has been formed, and a fund is being raised for the support of excavation and other work in connexion with the sites of Roman settlements that surround the city.

In distributing the prizes at the Hulme Grammar School, Oldham, Prof. Sadler said he came back to Lancashire every year as a resident, and what struck him more and more each time was the purposeful look of things. He strongly advocated a reduction in the size of classes in elementary schools.

In presenting the estimates for the year, the chairman of the Lancashire County Council Education Committee (Sir H. Hibbert) stated that a sum of £114,566 would be necessary for higher education, of which £74,566 would be required from ratepayers, the balance being accounted for by the Customs and Excise account. During the next five years it was calculated that the amount required might rise to £150,000. The total expenditure on elementary education was estimated to amount to £480,235. The estimates were approved.

BIRMINGHAM.

The University of Birmingham has lately made an alteration of its regulations which may have an important influence on its relations with the secondary schools of the Midland district. Hitherto all students who come to the University for degrees have been required to pass the Matriculation Examination before they can enter upon the usual University courses which lead to a degree. There are, however, a number of schools—both for boys and for girls—that are easily able to prepare their scholars up to a higher standard of attainment than is represented by the Matriculation Examination. In Birmingham itself the High School for Boys and the High School for Girls of King Edward's foundation have always their best scholars on much beyond the ordinary Matriculation stage, and there are several other schools within easy reach of Birmingham which are in a similar position. The University has decided, therefore, to recognize the excellent work of these schools by allowing their pupils to present themselves at entrance for the Intermediate instead of the Matriculation Examination. In this way the abler or more advanced students will be able to enter the degree course at a higher stage than they have hitherto done, and will not be obliged to repeat work which is already more or less familiar to them. They will, in fact, take in their first year's University course the course laid down normally for the second year. It is not, however, intended that University students shall be enabled to graduate in less than the three years which is laid down as the minimum length of a degree course; but by devoting themselves to work of a higher type they will be able in the Faculties of Science and Arts to make themselves eligible for the Master's degree. The altered regulations will also have a similar effect on students for degrees in Engineering and Medicine. The four years' course for a degree in Engineering may thus be reduced to three, and the five years' course for a degree in Medicine may thus be reduced to four. The revised regulations will be issued by the Registrar in a few days.

WALES.

Now that the Welsh Education Council, which is to be developed into a Home Rule Parliament, is taking definite shape, there is much speculation as to the future of the Central Welsh Board. The Home Rulers wish to absorb it at once, but expert opinion is unanimously against them. Under the rule of the very men who will compose the new Council, the business of almost all the County Education Committees has been so badly mismanaged that profound dissatisfaction prevails nearly everywhere. It is unlikely, to say the least, that those whose competency to deal with the educational requirements of county areas has yet to be demonstrated will successfully handle the delicate questions which a Council supervising both elementary and secondary education in the whole of Wales would have to deal with. The only condition under which such a Board can be effective is that it should contain a liberal admixture of real experts. On the new Education Council it is almost certain that there will be practically no real experts, though there may be a superfluity of *soi-disant* experts (every man who has served even on a rural School Board claims to be an educational expert in Wales nowadays). The fate of the Central Board depends entirely on the Board of Education, which can by a stroke of the pen transfer its functions to the new Council. It is believed that the Board of Education's present intention is to continue the Central Board in existence until it is satisfied that the new Council contains a sufficient number of real experts to enable it to tackle its responsible work with some prospect of success. In that case the Central Board will live much longer than many even of its friends think at present. The danger is that, if the Liberals get into power, the party which is now predominant in Wales will have sufficient influence to override the Board's objections to an educational Council of unlearned amateurs. Time may show that the new Council is competent to do the work now so successfully done by the Central Welsh Board, in which case there may possibly be advantages in entrusting the care of both grades of education to one body. In the meantime, the real educational experts of Wales sincerely hope that the Board of Education will leave well alone.

Until the present time, despite platform heroics, few have seriously believed that there was going to be a fight between the Board of Education and the Welsh Education Authorities. It was felt that some *modus vivendi* would assuredly be discovered. Now, however, after the failure of the endeavours of the N.U.T. and the Welsh University Authorities to arrange a truce, even the most sceptical are beginning to fear that there is a real danger of the Defaulting Authorities Act being put into operation. The Board of Education have issued what looks remarkably like an ultimatum to the Merionethshire and Barry Education Authorities, and the possibilities of the seemingly inevitable conflict are being much canvassed. The general opinion seems to be that in Merionethshire the Education Authority and the parents will support the Lloyd-George policy. In Barry the great majority of Education Authorities will certainly carry out the behests of the Member for Carnarvon, but it is very doubtful whether the parents will back them up. The population of Barry is very cosmopolitan, and the Welsh nationalist spirit does not burn as fiercely there as in other places. The leaders of the labour party in the town do not seem inclined to dance to the Cardiff Convention tune; and a strong Catholic minority is indignant at the treatment meted out to the Catholic school. The Board of Education's chances of victory are, therefore, far brighter in the mushroom town which is supposed to derive its name from St. Baruch than in Tom Ellis's old constituency. The money question is troubling even the stalwarts in that county. There has been much talk of a fund of £100,000, but so far only a very insignificant sum has actually come to hand, and doubts are freely expressed as to the feasibility of collecting sufficient funds to carry on the campaign. Those who are interested in secondary education are wondering whether the county schools will be closed at the same time as the elementary schools. Mr. Lloyd-George is believed to be anxious to shut up schools of all grades, but there does not seem to be any reason whatsoever why the secondary schools should cease their activities, and it is thought that means have been devised to avoid this calamity in the unfortunate event of the conversion of chapels, &c., into makeshift elementary schools.

The latest educational sensation comes from Aberdare, where all the certificated assistant teachers have tendered their resignations as the result of a resolution passed by the Education Committee depriving them of the power of inflicting corporal punishment. A vigorous controversy is now going on in the Welsh press as to the justifiableness of their action. It appears from inquiries made that the teachers have other grievances than this resolution, which is regarded as the culmination of a long series of insults. They maintain that certain labour members on the Education Committee have been carrying on such a campaign against them for many months that discipline had been seriously undermined, even before the passing of the now famous resolution, and that since it

has been passed their pupils have got completely out of hand. They claim, too, that the resolution was not brought forward for educational reasons, but out of personal spite against certain assistant masters. It is one of life's little ironies that the mover of the resolution, who spoke eloquently on the necessity of basing discipline on love and not force, is known to share George Borrow's interest in the noble art of self-defence outside the scholastic sphere.

The officials of the Guild of Graduates deserve all praise for their efforts to breathe life into the dry bones of that institution, and it is to be hoped that they will soon achieve a success commensurate with their exertions.

A well attended meeting was held at Cardiff at the beginning of last month, when Sir William Preece lectured on "Science Teaching in Schools." The rules of the Guild have now been altered to enable the Warden to hold office for four instead of two years.

All Welshmen who are interested in secondary education join in congratulating Mr. T. W. Phillips, Head Master of the Newport Intermediate School, on his appointment as Inspector of Secondary Schools under the

Board of Education. Under his administration the Newport School has won an excellent reputation.

SCOTLAND.

Probably the most important event of the month has been the publication of the Minute of the Education Department on the training of teachers. The object of the new arrangements which are proposed in the Minute is

Training of Teachers.

"to ensure that the training of teachers shall be brought into as close connexion with the University organizations as the attainments of the students upon entering admit of, and to provide means whereby School Boards and others directly interested in the question of the supply of teachers shall be in a position to secure due consideration for their views." The new system which will be instituted under the Minute amounts, in brief, to this—that, in connexion with each of the four Universities, there will be established a new Local Committee, which is intended to have practically complete control of the training of teachers within its district, and which is to receive the Government grants for this purpose. The new Committees will supersede the present University Local Committees (corresponding to the English day training colleges), and they are empowered to take over the management and property of the existing denominational training colleges; but they are expressly debarred from spending money on "the purchase or rent of any premises which are held in trust" by the managers of a training college "for the purpose of training teachers." They can, of course, purchase or rent from the denominational managers premises which are not thus held in trust.

It will practically be necessary—for the Presbyterian Training Colleges, at least—to hand over their buildings to the new Committees. To this they have already agreed, and it is made a condition of transference that "provision shall be made" in the colleges transferred "for religious instruction in accordance with the views of the Church or denomination" owning the colleges, "to an extent not less than that which is at present customary in the college so transferred, which instruction may either be provided by the accepting Committee or the transferring Church or denomination, as may be agreed between them." Further, representatives of the transferring Church or denomination must be co-opted by the accepting Committee as fully privileged members. The Committees are also empowered, if they so determine, to give on their own account instruction in religious subjects. And a still more important change is introduced by the provision that the Committees may train teachers not only for elementary, but also for secondary schools.

The new Committees are each to consist of representatives of the University, the technical, commercial, and agricultural colleges and the schools of art, the Chairmen of School Boards in various towns and counties, and the managers of secondary schools in the district. Three teachers are to be co-opted by each Committee, as well as a number of representatives of the Churches, which transfer their colleges, to be settled by agreement, or in the case of failure to agree by the Department. The Chief Inspector for each district is to represent the Department on the Committee as an assessor without vote. The Committee will inevitably be large, and a good deal of the work will therefore fall to sub-committees. The St. Andrews Committee will number 23, the Glasgow Committee over 40, the Aberdeen Committee about 40, and the Edinburgh Committee over 35. The size of the Committees is due to the very large amount of representation given to School Boards, which will have almost, if not quite, a majority in every instance. It is to this point that criticism is mainly directed. The system, in general, with its provision for the thorough organization of training, is heartily approved. But there is a general feeling of surprise at the predominance of the School Boards in the constitution of the Committees. It is probably too late to seek for a reduction in the number of School Board representatives; but there is a very strong

opinion in favour of increasing the University representation. If, as the memorandum attached to the Minute declares, it is one of the main objects of the change that the training of teachers should be "brought into close connexion with the University organizations," it seems a great mistake to give no more than five representatives to any one University on Committees that may number from forty to forty-five. The School Board interest is doubtless an important one; but it is difficult to see why it should receive a larger representation than all the other interests put together. Some of the existing Local Committees are making suggestions to the Department on this point, and it is to be hoped that the Minute may be modified before it is submitted to Parliament. Another defect in the constitution of the Committees is the absence of any definite provision for the inclusion of women as members. Women are, of course, eligible, but, as so many of the students are women, it is most desirable that some security should be given that women will actually be elected. Apart from these defects the scheme seems to be an admirable one, and it may be expected to work a salutary revolution in the training of teachers in Scotland.

In submitting the annual statement of accounts to the Aberdeen University Court, Prof. Matthew Hay mentioned that, although the number of students had increased by only eighteen last year, the growth in revenue from class fees had been about £1,600, as against £1,100 in the previous year. This increase in fees is, of course, to a great extent due to the liberality of the Carnegie Trust in granting fees for practical and honours classes. But Prof. Hay pointed out that, when the new regulations of the Trust, which require all students to pass the Arts and Science Preliminary Examination, come into force, the income per student will probably shrink instead of growing. It may be hoped, however, that this will be only temporary, and that the majority of the medical students will in time qualify themselves to pass the higher examination.

The University Court of Edinburgh is drafting a new ordinance in order to secure the addition of geography to the subjects qualifying for graduation in Arts and Science.

Glasgow University has lost a valuable counsellor through the death of Sir John Neilson Cuthbertson, who was for many years a member of the University Court and chairman of its Finance Committee. His services to education generally are cordially recognized in Glasgow, where for a long period he did admirable work as Chairman of the School Board.

A University Settlement has been established at Edinburgh to carry on social work in a poor quarter of the city.

The Scotch Education Department has issued circulars explaining arrangements which are being made for an interchange of French and Scotch teachers. The French Government is willing to employ young teachers in Scottish secondary schools for one year in French *lycées* and *collèges*. Their main duty will be to conduct small conversation groups of five or six pupils, and they will have ample opportunity to carry on their own studies in French. They will not be paid for their work; but they will receive board and lodging at the institution to which they are attached. It is proposed that a similar arrangement should be made for young French teachers in Scotland. In no case will their duties occupy them for more than two hours a day; but they may, of course, give voluntary help in connexion with school games or in other ways. The arrangement seems an excellent one, and it ought to result in much benefit to education in both countries.

We regret that the Irish letter reached us too late for insertion.

SCHOOLS.

S. CATHERINE'S SCHOOL, BRAMLEY, GUILDFORD.—Thirty pupils from the school were entered for the Cambridge Examinations held in December, 1904. All of these passed.

HAILEYBURY COLLEGE.—The following scholarships have been gained by members of the school:—R. L. Yorke, Worcester College, Oxford; I. S. Hood (History Demysip), Magdalen College, Oxford; C. E. Woodhouse (Mathematics), Pembroke College, Cambridge; H. G. Stokes, Pembroke College, Cambridge; H. F. Knight, Caius College, Cambridge. S. J. Galloway has gained an Exhibition at Jesus College, Cambridge. G. N. Bignell and A. T. de M. Uttersen have passed into R.M.C., Sandhurst, direct from the school.

ROSSALL SCHOOL.—C. A. Storey has won Latin Hexameter and Greek Iambics Prizes. The following College Scholarships have been awarded:—W. K. H. Campbell, Classical Exhibition, Wadham College, Oxford; G. S. Woodman, Classical Scholarship, Jesus College, Cambridge; F. W. G. Douglas, Classical Scholarship, Clare College, Cambridge; V. W. Richards, Classical Exhibition, Jesus College, Oxford; R. B. Abell, Classical Exhibition, Lincoln College, Oxford; G. G. Woodruff, Mathematical Scholarship, Caius College, Cambridge; R. C. Cutter, Choral Exhibition, Jesus College, Cambridge. The new observatory is in building to house the new telescope. The Rev. W. H. Abbott, of New Guinea, gave us a most interesting lecture (February 6) on life in that region.

(Continued on page 206.)

NEW IMPRESSION. JUST READY.

NELSON'S

Differential and Integral Calculus for Beginners.

*SPECIALLY ARRANGED TO SUIT THE REQUIREMENTS
OF STUDENTS OF PHYSICS AND MECHANICS.*

By **EDWIN EDSER.**

Associate of the Royal College of Science, London; Fellow of the
Physical Society of London; Lecturer in Mathematics
and Physics, Woolwich Polytechnic.

Cloth. Price 2s. 6d.

Written for the benefit of Students of Physics. All extraneous difficulties
are removed, and the fundamental principles are simply explained.

A MATHEMATICAL MASTER writes:—"I have carefully examined
the book, and am very pleased with it. The interest in the work which
can be developed by happily chosen examples of its applications is
indeed well brought out by Mr. Edser. From that standpoint the book
is a *revelation* even to a teacher—perhaps especially to a teacher. The
book is so wonderfully cheap."

THOMAS NELSON & SONS,
35 and 36 Paternoster Row, London;
Edinburgh; Dublin; and New York.

MOFFATT'S PLAYS OF SHAKESPEARE.

Edited by THOMAS PAGE.

The following books in this well-known Series are all **PRESCRIBED
FOR FORTHCOMING EXAMINATIONS**, and contain every
help that the student can possibly require:—

J. POOLE & CO.,

(ESTABLISHED 1854)

104 CHARING CROSS ROAD, LONDON, W.C.

(Late of 39 Holywell Street, Strand.)

SHREWSBURY HIGH SCHOOL.—The Company's Scholarship was awarded to D. Haydon. Letters from the Joint Board were gained by M. Carthew and A. Franklin, the latter obtaining Distinction in Botany. J. Mansell passed the London Matriculation Examination, and A. Wilkinson Responsions in Classics and Mathematics. M. Pugh passed in the Advanced Grade of the Associated Board Local Examination, and two other pupils in the Intermediate Grade. In the Royal Drawing Society's Examination thirty-nine Honour and seventy pass certificates were obtained, and at the Society's Exhibition M. Gough was awarded a gold and M. Rice Oxley a bronze medal. In the Exhibition of Drawings from all schools of the Girls' Public Day School Company B. Wace gained Miss Gurney's prize for Design and M. Gough the second prize for Foliage. Miss E. Wigglesworth and Miss E. Cunningham have left the staff, and their places have been taken by Miss Reeve, Newnham College, and Miss Lloyd Evans, M.A. St. Andrews. The annual prize giving took place on Friday evening, December 16, 1904. The report was read and the prizes and certificates distributed by the Head Mistress. Then followed a programme of music rendered by the pupils.

PRIZE COMPETITIONS.

The Translation Prize for February is awarded to "Walkerburn."

The Extra Prize for February is awarded to "Nelto."

"H. M. B.," winner of the Extra Prize for November, asks that the guinea may be sent to the Convalescent Home for Poor Children, St. Leonards-on-Sea.

The winner of the Translation Prize for January is E. R. Morgan, Esq., 22 Vicar's Hill, Ladywell, S.E.

The winner of the Extra Prize for January is Dr. R. L. Batterbury, Berkhamsted.

Ein Gärtlein weiss ich noch auf Erden,
Drin wandl' ich gern bei Tag und Nacht,
Das kann mir nie verwüstet werden,
Es ist von Engeln stets bewacht.

Da zeigt sich noch den Augen immer
Der Himmel wolkenleer und blau,
Da äugelt noch wie Demantschimmer
An Gras und Blättern Himmelstau.

Da fliessen noch die Brunnlein helle,
Nichts hemmt noch trübet ihren Lauf,
Da spriessen noch an jeder Stelle
Die schönsten Blumen morgens auf.
Da müssen noch die Klagen schweigen,
Da ist das Herz noch allzeit reich;
Da hängt an immergrünen Zweigen
Noch traulich Blüt' und Frucht zugleich.
Da gibt's noch keine finstern Mienen,
Nicht Zank noch Neid, nicht Hass noch Zorn;
Da summen stachellos die Bienen,
Und Rosen blühen ohne Dorn.
Da lächelt schöner noch die Sonne,
Und heller blinkt uns jeder Stern;
Nur nahe sind uns Freud' und Wonne,
Und alle Sorgen bleiben fern.
O sucht das Gärtlein nicht auf Erden!
Es ist und bleibt uns immer nah'.
Wir dürfen nur wie Kinder werden—
Und sieh, gleich ist das Gärtlein da.

By "WALKERBURN."

Somewhere on earth is blooming lowly

A garden where I love to stray;

Secure it lies, for angels holy

Watch over it both night and day.

In all the sky above it bending

No cloudlet ever flecks the blue,

And, more than diamond-radiance lending,

Flashes from leaf and blade the dew.

Adown its slopes the streams run singing,

Nought comes to check their even flow,

And morn by morn fresh flowers are springing

Till all the garden is aglow.

No sound is heard of doleful sighing;

For here the heart finds richest dower

Where trees through all the year undying

Bear two-fold load of fruit and flower.

(Continued on page 208.)

. . IMPORTANT ADDITIONS TO . . PHILIPS' "SEMI-UPRIGHT" COPY BOOKS

A NOVEL and extremely useful addition has been made to the popular series of "Semi-Upright" Copy Books. After No. 10a three additional books have been inserted—these three are written in French, and are designated 10b, 10c, and 10d.

The Publishers believe that such an addition will be welcomed by teachers and parents, inasmuch as it provides further aids to the acquisition of that style of writing which has successfully stood the test of long experience, and also furnishes a means whereby the scholar may be pleasantly familiarized with the correct writing of easy French Exercises.

At the present time a very wide and intelligent interest is being taken in the teaching of French, and practicable ideas, that tend to make such teaching sound and interesting, are cordially received and adopted. In this new departure of adding an admirably designed French section to the "Semi-Upright" Series of Copy Books, the Publishers have embodied an idea which they believe will be universally recognized as providing a very interesting and valuable auxiliary to the teaching of French. The three books contain a judicious and comprehensive selection of useful exercises, which are treated with thoroughness and attention to practical details by teachers and examiners of experience.

Nos. 10b, 10c, and 10d are admirably fitted to meet the requirements of schools where frequently a few lines of writing in French are given as a Home Exercise. The use of these books on such a plan will be found an acceptable means of securing excellent penmanship, and, at the same time, of *arousing, or quickening, an intelligent interest in the French Exercise.*

THE SERIES IS COMPLETE IN 21 BOOKS. PRICE 2d. EACH.

MERRYWEATHERS,
FIRE ENGINE MAKERS TO H.M. THE KING,
63 LONG ACRE, LONDON, W.C.
WORKS: GREENWICH ROAD, S.E.

Here is no strife nor envy, bringing
The gloomy shades of hate and scorn ;
The very bees forget their stinging,
The roses bloom without a thorn.

The sunshine here gives double measure,
Here are the stars more crystal clear ;
The only guests are joy and pleasure,
And troubles never venture near.

Oh ! you have sought, and own with sorrow
You find it not, this garden sweet ?
A childlike heart you first must borrow,
And lo ! the garden's at your feet ?

By the PRIZE EDITOR.

Still upon earth I know a garden,
Where day and night I love to roam ;
An angel at the gate stands warden
To keep from harm this happy home.

There still the heavens are ever beaming,
A cloudless vault of living blue,
And every blade and leaf is gleaming,
Besprent with diamond drops of dew.

There rivulets still ripple gaily,
Unchecked, unsullied as they run,
And everywhere fresh flowers daily
Unfold their beauties to the Sun.

There is no room for idle sighing
Where every heart is satisfied,
Where on green branches never dying
Blossom and fruit hang side by side.

No brow is knit, no visage lowers
With anger, hatred, envy, scorn ;
There bees flit stingless 'mid the flowers,
There roses bloom without a thorn.

There the Sun smiles serenely, clearer,
More radiant twinkles every star ;
There joy and merriment are nearer,
And heaviness is banished far.

Yet not on earth shalt thou inherit
This garden ; 'tis within the mind.
Become again a child in spirit.
And straight the garden thou shalt find.

We classify the 115 versions received as follows :—

First Class.—Otag, West Country, G.E.D., Queen, Walkernburn, E.H.O., Gwalia, Cléo Val, Bruce, Bildad the Shuhite, Yoland, Anglice, Dudevant, A.M., Cruthy.

The Fallersleben lyric calls for little comment—*solvitur transferendo*. As I have before remarked, it is for the translator to show cause for deserting the metre of the original. Here there seems to me no sufficient reason, and even the double rime presents no difficulty except in the fifth and last stanzas. There is in the original a verbal contradiction between

“I know on earth a garden”

and

“Seek not on earth the garden.”

The translator must not suppress or ignore this, but he may show that it is merely verbal—the garden is on the earth, but not of the earth. The recurring *noch* was ignored by many. Otiose “do” and “doth”

(Continued on page 210.)

SIX RECENT BOOKS FROM GINN & COMPANY'S LIST.

The Sonnets of Shakespeare. With Introduction and Notes by H. C. BEECHING, M.A., D.Litt., Canon of Westminster. lxvii + 145 pp. Price 3s.

All the most recent theories on the subject are discussed, and the Sonnets are divided into groups and annotated with scholarship and care.

“Canon Beeching's introduction . . . is a scholarly and able contribution to the literature of the subject.”—*Spectator*.

“This edition of the Sonnets is a model of ripe scholarship, sound judgment, and temperate utterance.”—*School*.

“None has produced a more satisfactory compendium of all that is really necessary to be known about the ‘Sonnets,’ or afford a more serviceable key to their numerous difficulties.”—*Academy*.

Selected Poems of Elizabeth Barrett Browning. With Introduction and Notes by ELIZABETH LEE. xxix + 173 pp. Price 1s. 6d.

The poems selected are chosen with a view of presenting something of all the more excellent sides of Mrs. Browning's genius. The shorter poems are given in their entirety; the longer are represented by a few passages only.

“The selection is excellently made; it is fairly representative; and the Introduction is concise and complete.”—*Guardian*.

“... an intelligent and appreciative Introduction, and a series of concise and admirably lucid notes.”—*Bookman*.

Locl Critici. By GEORGE SAINTSBURY, M.A., Professor of English Literature in Edinburgh University. v + 439 pages. Price 7s. 6d.

Passages illustrative of critical theory and practice from the works of the masters, from Aristotle to Matthew Arnold.

“For classes in higher English literature the book is invaluable.”—*The Journal of Education*.

“A book of incalculable service to all students of critical theory.”—*Pall Mall Gazette*.

“The book was worth doing, it is well done, and it should have been done by no other. . . . We welcome this scholarly selection from the works of the masters of rhetoric.”—*School*.

DESCRIPTIVE LIST POST FREE ON APPLICATION.

Machiavelli and the Modern State. By LOUIS DYER, sometime Tylorian (Italian) Scholar of the University of Oxford, and formerly Assistant Professor in Harvard University. xviii + 163 pp. Price 4s. 6d.

Chapters on his “Prince,” his “Use of History,” and his “Idea of Morals,” being three Lectures delivered in 1899 at the Royal Institution.

“Written with a wide knowledge of the subject, and a sympathetic realization of Italy and the Italians of the Renaissance. . . . We gladly welcome Mr. Dyer among the ranks of Machiavelli's champions.”—*Oxford Magazine*.

“Clear, well written, and based on considerable thought and study.”—*Guardian*.

A Short History of England. By E. P. CHEYNEY, Professor of European History in the University of Pennsylvania. 695 pp. Price 6s. 6d.

For Higher Secondary Schools. The earlier period is treated in some detail, with a view to a clearer understanding of the later story of events in the life of the nation. The book contains about 150 drawings and 40 maps.

“We welcome this book. . . . A few more such will do much to revolutionize the history lesson, and to make possible a clearer idea of the function of history.”—*Academy*.

“Combines breadth and freshness of treatment with excellence of print and binding, and wealth of appropriate and artistic illustration.”—*Guardian*.

Readings in European History. By J. H. ROBINSON, Professor of History in Columbia University. 551 pp. Price 7s.

Selections chosen to illustrate and expand the author's “History of Western Europe.” Care has been taken to include only really clear and interesting passages, the importance of which can be readily grasped.

“An excellent book, the perusal of which will make history more living; and the study thereof by our teachers and elder scholars will go far to give them a knowledge of history, and, above all, a desire for more.”—*School World*.

WHAT IS THE TRUE ETYMOLOGY OF THE WORD "EDUCATION"?

By WILLIAM JOLLY, late H.M. Inspector of Schools.

THE etymology of the word "education" has been generally given as from *e* or *ex*, "out," and *ducere*, "to lead"; and it is explained as the "leading" or "drawing out" of the faculties of the mind of the pupil. As put by Edward Irving: "The true idea of education is contained in the word itself, which signifies the art of *drawing out* or *educing*; and, being applied in a general sense to man, must signify the *drawing forth* or *bringing out* of those powers which are implanted in him." Beyond question, this is an admirable statement of the most important function of all teaching, which is the development of mental capacity. So well has this happy expression of the chief end of all education recommended itself, that this derivation has almost universally been accepted as the real one—so much so that it requires some courage to dispute it, and to seek to shatter an admirable exposition of the main purpose of all true teaching. But the one question in this, as in all other inquiries, is: What is the *truth* of the matter? We may feel assured that the truth, when found, will carry its own compensations and beauties; though it may, as in other fields of investigation, break some ancient idols in education, in which iconoclasm is as necessary and salutary as elsewhere.

First, then, the fact of its philosophic completeness, when one thinks of it, is enough to throw doubts on its verity. For the words we are investigating contain within them the ideas of our ancestors regarding the training of their children, at a period when simple notions of the process could alone have existed, and when philosophic accuracy and insight could not be expected; like the words, *instruction* and *culture*, in which the task is happily and simply expressed by comparing it with the work of building and tilling, with which early tribes are familiar. But it is a very different matter when an etymology asks us to believe, that our rude forefathers had such an insight into the process of training as to perceive that it involved the development of innate, latent powers in the mind and body of the infant.

In regard to this, it may at once be asserted that, among the Romans, with whom the word *Education* originated—a practical, unphilosophic race—no such conception existed, in regard to the upbringing of children, as that the child was a being possessed of a congeries of faculties in embryo, which it was the function of parents and tutors to bring to perfection. This is a form of thinking regarding the training of a child that has come late into the thought and practice of the race. It could arise only after mankind had attained a certain level of philosophic reflection and culture; against the all-too-prevalent tendency to substitute telling and cramming for true mental and moral development.

As Prof. Simon Laurie, summarizing his admirable history of Roman education, says:

The humanities and learning, art and the beautiful—these were not the motive forces of Roman education, as they had been among the Greeks, but rather those arts which might be of political service. Harmonious development, culture—either of mind or body—for its own sake, was an idea alien to the Roman mind. It was only when the seeds of decay had been already sown that Hellenic aims and Hellenic culture found a place—and then only partially. The practical Roman life was essentially opposed to the Greek æsthetic life.*

But let us look more closely into the philology of the word itself. The word *education* is certainly and admittedly derived from a verb of the first conjugation—*ēdūco*, *ēdūcāvi*, *ēdūcātum*, *ēdūcāre*—in which the *u* is short and the *a* long; whereas *duco*, *dūxi*, *dūctum*, *dūcere*, to lead, is of the third conjugation, with the *u* persistently long and the *e* of the infinitive short. So that to derive *ēdūco* from *duco*, to lead, we have to violate the laws of vowel length and conjugation, which in Classics were rigid to a degree to which we, in English, are strangers.

Moreover, we have the true and regular derivative itself from *e*, out, and *ducere*, to lead, in *ēdūcere*, with its natural and regular meaning—to draw, or lead, out—like the other derivatives from that verb, with their long vowels, as represented in English by *produce*, to lead forward; *reduce*, to lead back; *seduce*, to lead

aside; and many more. The existence of *ēdūcere*, to lead out, would seem at once to warn us against taking the word *ēdūcare* from the same verb; thus duplicating its meaning and introducing into the one in question the extreme philosophic notion of mental evolution that is necessary to justify the etymology thus popularly adopted.

Then, as if to warn us against the current etymology of the word, we have the regularly formed noun from *ēdūcere*, in *eductio*, -onis—that is, *eduction*, which signifies a leading out or removal from one place to another, as from a camp—a frequent use of the word in its literal physical signification; not *ēdūcatio*, -onis, or *education* in its metaphorical meaning, which it only came to signify in late Latin, and as used by philosophers.

But let us inquire into the real signification of *ēdūcare*, in order to ascertain, if possible, what idea it conveyed to the practical Roman mind of early times. This would seem to lead us still further away from *ēdūcere*, to draw out, as its root. For *ēdūcare* meant truly to feed, to nourish, to bring up, and was used of animals and plants, as well as human beings—pointing conclusively to the notion of nutriment or food as its simple and essential thought. Though it may, with some force of reason, be contended that development of faculty might be its idea as applied to the human child, it will scarcely be argued that such a notion as the development of innate powers was natural or possible in its application to plants and rats and mice!

Examining the matter still further, we find that the word *ēdūcator* in Latin meant a rearer, nourisher, or bringer-up of children. And, what is more remarkable, the Romans had the word *educatrix*, or *educatress*, solely in its application to the nurse of the baby, with its meaning of feeder and caretaker. The existence of this word in the feminine, as the designation of a woman, generally a slave, the nurse of the new-born infant, is of special significance. It is a most suggestive proof that *feeding*, the imparting of nutriment, and not *educating* in the sense of development, as applied to the function of the female attendant on the child, was the genuine, natural, and primary meaning of the words *educatio*, *educator*, and *educatrix* among the Romans.

An additional and singularly interesting fact, pointing in the same direction, is this. That the Romans, from their natural tendency to polytheistic thought and the multiplication of deities for the functions of life, had a number of gods and goddesses to take care of the child during the trying period of infancy, and to help the mother and others in their many duties. Thus they had *Janus*, to open the door of life to the child; *Cunila*, to attend to the cradle and watch him during sleep; *Rumina*, to supply milk to the breast; and *Potina*, to give him drink. Among the host of assistant tutelary deities, there was also *Educa*, whose special duty was to take charge of its food.

The existence of this old Roman goddess, *Educa*, with a specific function, one of all importance—to take care of the food administered to the infant—seems (does it not?) a pretty and conclusive proof that the simple idea, that of feeding, is the true one as conveying the signification attached by the Romans to the word *Education*. It is also a revelation of the extreme simplicity of the early Roman mind, and the practical and unphilosophical tendencies of that people, that they had such a host of attendants on the child, each having a plain and practical task assigned to her, in the feeding and *education* of the Roman child. Is it not a proof that it is in such simple and natural notions that we must seek for the true idea attached by that people to the word *Education*, and not in an ultra-philosophic thought like *development*?

A very significant passage from the lost works of the Roman philosopher Varro has happily been preserved, in which the different designations and offices of those who had to do with the upbringing of the child among the Romans are etymologically discriminated and explained. It is this: "Edūcit obstetrix, edūcat nutrix, instituit pædagogus, docet magister." This may be thus translated: The midwife *educes*, or draws forth, the child at birth; the nurse feeds, or *educates*, him; the pædagogus (or slave attendant) takes charge of him; the schoolmaster teaches him." Here, at once, and clearly expressed, we have the distinction between the two words—*ēdūcere*, to lead out, and *ēdūcare*, to feed—placed before us, and compared and distinguished. This shows that, in Varro's view, as expressing the general opinion of the Roman people, the two words were not only not derived from each other, but were originally carefully

* "Historical Survey of Pre-Christian Education," by S. S. Laurie, LL.D. (Longmans, 1895.)

discriminated; and that *educāre* meant to feed, to nourish, as its real idea and root. The word *nutrix*, or nurse, being used for the other, *educatrix*, points to the fact that they were interchangeable in meaning and usage. *Nutrix*, the female slave nurse, and *educatrix*, the female *educatress*, are thus proved synonymous.

All investigation into Roman life shows how largely home life and infancy, the nursing and upbringing of their children, bulked in the thought and polity of the Romans; and all investigation into their family arrangements reveals the same wise and kindly spirit, and the active personal interest they took as parents in the rearing and educating of their offspring. It also shows how natural it was for such a domesticated people to conceive of the educational process as signified by the chief care of the nursery, in providing the infant with appropriate nourishment; and to name the whole education of the child by these earliest solitudes, on which his whole health and development depended; and to conceive of its *after* stages as but a continuation of the means by which this was secured in its initial years in the home—that of *nourishment*.

But what are the opinions of Philologists as to the etymology of the word *education*? Till recently, the majority, if not all of them, were in favour of the orthodox opinion, from *e* or *ex*, out, and *dūcere*, to lead; but of late, doubts have begun to be expressed on the subject. One excellent educational authority—Kiddle and Schem's "Dictionary of Education," of New York—asserts that "it is extremely unlikely that the Romans connected the idea of 'drawing out' with *educatio*." Skeat does not seem to have given it much consideration; for he dismisses it summarily as from *dūcere*, to lead. Dr. Murray, in his monumental "Dictionary," has doubts about it evidently, though he does not pursue them to any definite finding—speaking, in regard to it, of the "quasi-etymological notion, drawing out," and saying, not that it is derived from *dūcere*, to lead, but "related to it." In regard to this relation, it is no doubt true that such a connexion, in meaning and usage, did, in time, exist in Latin, as in English and other tongues; and that the idea that the one was derived from the other became dominant and influenced thought and speech on the subject. But, though this is granted, it is no proof of the etymological relation of the one to the other, much less of the derivation of the one from the other.

Let us now try, if possible, to discover the true root of the word *educāre*, to educate. It has been suggested that it comes from *edere*, to eat; the English word *eat* itself being from the same radical as the Latin, *ad*, to eat, to consume, which is represented in Sanscrit, Greek, and most European languages, the same root also giving rise to *dental* and *tooth*, the instruments of eating. If this is the root of *educāre*, to educate, this Latin verb might be viewed as a causal form of *edere*, meaning to cause to eat, to feed—the middle syllable *uc* representing the root of *agere*, to do, to drive, to be the agent of, which is the source of a host of English words like *agitate*, *action*, *active*.

It has been pointed out that a similar cognate form occurs in the verb *manducāre*, to chew, to masticate; which is a lengthened form of *mando*—to chew, to use the mandibles, or jaws, upon. There are difficulties in connexion with this etymology, such as, the origin of the middle syllable in *educāre*; the fact that this syllable in *manducare* is long, and not short, as in *educāre*; the fact of the first syllable in *edere* being short and the first syllable in *educāre* being long—though this might be accounted for by the absorption in it of *e* or *ex*, out, or as an intensive.

The philological and other difficulties in deriving *educāre* from *edere*, to eat, make it desirable that another radical or derivation associated with the central conception of *educāre*, as that of feeding and fostering, should be found. After much investigation, I would suggest the Aryan root, *√dhugh* or *√dug*, to give milk to, or take milk from. This root contains the short vowel *u* and all the requisite consonants needed for the derivation; and thus gets rid of the philological objections of *educāre*, as from *dūcere*, to lead, as well as the insurmountable hyper-philosophical conception of the development of faculty. It carries with it the idea of nourishing and feeding in its earliest, most elementary, and most significant form—that of giving *milk* to the child; and it is associated with its tenderest, most suggestive, and most natural and nutritive food—the milk of the mother or the nurse or foster-mother.

From the same Aryan root, *√dug*, we have also that fine

word *daughter*, which is represented in Sanscrit by *duh-itri* (from the Sanscrit *duh*, to milk), and which runs through all the Indo-European languages—both the Classical branch, as in the Greek *θυγάτηρ* (*thug-atēr*), and the Teutonic branch, as in the German *Tochter* and the Scotch *dochter*. But this word *daughter* has, in its original signification, been wrongly explained, in my opinion, to mean a milker of cows. This seems not only odd, but erroneous; as it designates a child from one of her duties in after life—like that of *spinster*, the spinner—instead of from a sign or function cognate with her infancy, and indicating her sex as distinguished from that of a son. It would seem more natural and sensible to associate the notion of milking, from which the name *daughter* is derived, with her breasts, as a distinguishing sex mark from the first; thus signifying the child "with the breasts" or "dugs," that is *daughter*.

This old word *dug*, a breast, which has degenerated in use, is from the same radical as that of *daughter*—*√dug*, to milk. It had originally a kindly application to humanity and womanhood, in a reputable and tender sense, up to the time of Shakespeare. He tells that the nurse of Juliet applied wormwood to her "dugs," to relieve them of pain, when that sweet child was weaned. As Dr. Johnson, the lexicographical pioneer, puts it: "it seems to have been used formerly of the breast without reproach"—quoting, also, Spenser, in proof, who speaks of a woman that was "as mild and gentle as the cradle-babe, dying with its mother's 'dug' between its lips."

I submit, therefore, that in this root, *√dug*, to give milk, we have the original source that we are in search of for the word *educāre*—to feed, to foster, to educate; and the true reason of its constant association with nutriment and nourishing, as in the phrase already quoted from Varro, that the child's nurse "educates" the child—*nutrix educat*. This shows, primarily, that educating the infant was feeding it: supplying it with its first natural food—milk from the breast. The first syllable of the word *educate* is, of course, from *e* or *ex*, out, and expresses the action of the child in sucking; or it may be used simply in its common form of an intensive.

This self-evident, suggestive, and natural analogy between educating and nourishing is applicable to the whole process of Education, even in its more advanced stages of study and learning. It has originated the telling and most expressive phrase *alma mater*, as descriptive of the function of a University to its students—signifying that these students are simply children, imbibing instruction or learning up to its highest stages and in all branches of the arts and sciences, as from a Mother, whom they affectionately and appropriately designate their Nourishing Mother—*alma* being derived from *alere*, to feed. So, in pursuance of this happy association of ideas, we have the word *alumnus*, a student—literally and significantly, a *child* who gets *nourishment*—intellectual food from his learned mother; this term, *alumnus*, under the Romans, signifying a nursling, a pupil, a scholar.

In conclusion, I would direct the reader's attention to the peculiar point of view in regard to Education, its purpose and process, to which our researches have led us. According to the received etymology of the word, *education* signifies the art of "drawing out" the faculties of the child. According to the etymology we have reached, education is the art of "putting in," instead of drawing out—of supplying the child with food for his development. This natural and simple conception, based on early home nurture, recommends itself as true in fact; and its simplicity and wisdom will be the more seen the more it is considered. But it requires special reflection in order to fully comprehend its significance—all the more that our ideas of the educational process have been dominated by the common conception of "drawing out." It will, perhaps, be best apprehended by consideration of plant life and culture.

There is a tree in your garden, which you wish to cultivate, in order to obtain from it flowers and fruit. To enable it to do this, there is only one way—you must feed the plant; you must provide it with appropriate nourishment, to be assimilated by its rootlets, that it may grow and develop and produce the desired flowers and fruit. That is, you must *feed* the plant, to enable its innate powers to evolve the wished-for products it is capable of giving.

The same holds true of animals and man. You must furnish them with appropriate *nourishment*, that they may grow, and develop their innate capacities of body and mind; and there is no other way. At first, this food is the milk of the mother,

then other milk, and, in time, other food, according to the age and growing capacities of the child. And it is this idea of feeding, or supplying nourishment, that is the central thought in the conception we have reached as the true etymology of the word, *Education*. It is in no sense antagonistic to the other idea of evolving or drawing out the powers of the child or pupil; but it directs special attention to the means or process of doing this—by supplying the necessary materials for this development, to enable the child to evolve and exercise his faculties. In a word, it signifies the providing of aliment to make possible the development of faculty, which is one of the chief ends and results of true education.

This idea of *feeding*, as the root thought of Education, is full of happy suggestions and instructive analogies, pointing out true methods and aims in teaching and educating. It indicates the need of careful preparation of the food to be administered, and its adaptation to the age and capacity of the child. It points out the folly of cramming, that is, forcing to eat, what is unpalatable or unhealthy or beyond the amount that can be digested. It shows the wisdom of being guided by the central principle of all education—that all the mental food administered must be partaken of by the child himself, and assimilated by him, to become the means of healthy growth in all parts of the system. It proclaims that all healthy teaching, like all healthy feeding and eating, is regulated solely by the power of digestion; and that everything in defect or excess or in violation of it must result in starvation, repletion, or disease. It enforces the importance of variety in the constituents of the food imparted; so that it may include all the elements requisite for the building up of all parts of the system—the bones of moral action, the muscles of intellect, and the nerves of æsthetic and spiritual perception. Thus we are led once more to the grand conception of all true instruction and education; as that of full development of the whole manhood and womanhood of the race: so as to lead to a healthy and vigorous constitution, capable of happy work and the progressive evolution of human capacity.

REVIEWS AND MINOR NOTICES.

A Companion to Greek Studies. Edited by LEONARD WHIBLEY.
(Price 18s. net. Cambridge University Press.)

When Greek studies were revived in Europe it was the utmost joy of a scholar to possess himself of a Greek manuscript. Perhaps he would then hug it in secret, or, making his good fortune known, derive a malignant satisfaction from the envy of the learned world; perhaps he would put forth a Latin version of it, or, as subsequently came to be usual, he would employ it, or allow it to be employed, in the constituting of a text for the press. As Greek books were multiplied by the new machinery of production, they attracted numerous readers, who won to their meaning by comparing their contents. Then lights were got from external sources, above all, from inscriptions. By various means a body of knowledge, or of what seems to be knowledge, has been accumulated vast enough to have appalled those who first inspired the revival. Boccaccio will hardly have imagined that so much was to be known of the Greeks as is told in the pages of a *Pauly-Wissowa*.

The time is deemed to have come when the accumulated mass may properly be subjected to a sort of analytical process, the certain being separated from the uncertain and put at the disposal of students in a concise form. Not that the speculative is to be discarded as wholly valueless: some measure of imagination has been found serviceable in many branches of science, even in archæology. But there are those who are intolerant of hypotheses. Again, there are those who love the truth most when it is most closely condensed; and there are those before whom to hesitate is to be lost. Youth, for example, requires facts, expects them to be stated with a brazen confidence, and is impatient of the details, instructive or ornamental, in which age delights. In short, youth demands a handbook. The "*Companion to Greek Studies*," now before us, is, if we must class it, simply a handbook. But it is a handbook that no one will be ashamed to own and consult, a handbook that will be sure to fill a place not only in libraries

designed for the young, but also on the desk of the teacher and on the shelves of the scholar.

The best way in which we can give our readers an idea of the new book is to remind them of an old. The "*Companion*" does for Greek what Paul's "*Grundriss*" does for Germanic philology. Only it is on a much smaller scale. It is a single volume of seven hundred pages. Into this compass there has been brought a great store of varied information, and that of a kind not contained in ordinary histories and grammars, about Greece, the Greeks, and their language. Every subject has been assigned to some one conspicuously an adept in it. Geography by Mr. Tozer is the opening topic. Canon Tristram discourses of fauna and flora; Mr. R. D. Hicks of chronology and of the later schools of philosophy; and Dr. Jackson of the earlier down to Aristotle. To tell of art we have a Waldstein, of mythology and religion a Gardner. Miss Harrison talks about birth, marriage, and death; Lady Evans about dress. As was to be anticipated, it is to Dr. Sandys that the history of scholarship has been allotted. To name only a few other contributors, epigraphy is done by the Master of Caius, palæography by Mr. J. Rendel Harris, and metre by Dr. Verrall; whilst Prof. Sir Richard Jebb, treating both of literature and of textual criticism, moves like a master among his own goods.

The book is edited by Mr. Leonard Whibley, who also furnishes a section on constitutions. What the functions of an editor are has long been disputed; what the present editor has done in the present case we have no means of determining, so that we cannot appraise his work rightly. We can see, however, that it is not faultless. Possibly such a team, if we may use the figure without disrespect, was hard to drive. At any rate one or two discrepancies in writing have been left unreconciled. "*Suidas*," for example, appears in the earlier pages; afterwards Dr. Sandys will hear of nothing but "*Suidas*"; so we have Dion as well as Dio Cassius. Furthermore, a few oversights or misprints have escaped detection. Thus the first part of Delbrück's "*Geschichte der Kriegskunst*" was published in 1900, not (as asserted on page 474 by Mr. Oman, the rival and abler strategist) in 1902; and it was the fourth, not the third (see page 345), edition of Preller's "*Griechische Mythologie*" that was intrusted to Carl Robert. But it would be unjust to leave an impression that slips of this character are many or important. The book is printed with an uncommon degree of correctness. On the other hand, it has a real blemish for which the editor must be held responsible. The index is sadly imperfect. Moreover, Mr. Whibley has actually permitted to stand in it an entry which implies that Herodian the historian was identical with Aelius Herodianus the grammarian. Even an index-maker might have seen that a writer who flourished c. A.D. 160 could hardly have composed a history that goes down to A.D. 238.

Albeit that the book is planned to contain the "substance of our knowledge," there is no reason to fear that it will discourage inquiry and harm education by stifling curiosity. A little illustration may show how difficult it is to reach finality. We used to be taught that the navel-stone at Delphi was *in* the temple. About 1896 a writer for the *Pauly-Wissowa* (II. 65) emphasized the fact that it was outside. Two years later Dr. Frazer persuaded us that, having once been inside the temple, it had been moved to the outside before the days of Pausanias—persuaded us, or almost persuaded us; for we felt that the same result would have been obtained by moving the temple, and that the navel-stone, with its peculiar significance, was hardly a proper object for flippant transportations. Now Prof. Gardner, who has doubtless the latest intelligence from Delphi, avers without any limitation of time that it was *in* the temple, and so restores the old teaching to honour. There is room still for the archæologist who will contend that, passing through a wall, the stone was either inside or outside, according to the point from which it was regarded. And, if the "*Companion's*" knowledge is not always final, is it invariably sound? Prof. Gardner and the *ὀμφαλός* set us thinking. Do we *know* that the *σεπτήριον* was performed at the Pythia? Were the *φαρμακοί* led out at the festival of *θαργήλια* or on the day before it?

Perhaps there are a few small inaccuracies in the statements that we have been considering, all on page 308. If so, we must ascribe them to what we judge to be the chief fault of the book—to over-compression. The copious matter is too tightly packed. Conciseness has its dangers; moreover, it may

become repulsive. Not as a fair specimen of quality, but to bring out our meaning, we make a short extract :—

The learned printer Robert Estienne or Stephanus (1503-59) produced his Eusebius in 1544, his Greek Testament in 1546, and the works of Dionysius and of Dio Cassius on Roman history in 1546-8. His son Henri Estienne (1528-98), who is best known for his Greek *Thesaurus* (1572), and for his *Plato* (1578), was a pupil of Turnebus (1512-65), who as Greek Professor and as Director of the Royal Press in Paris produced editions of Aeschylus, Sophocles and the *Ethics* of Aristotle. Dorat (c. 1504-88) edited the *Prometheus* in 1549. The fame of Lambinus (1520-72), who spent nine years in Italy, and of Muretus (1526-85), who lived there from 1563 to his death, rests mainly on their Latin scholarship, though Lambinus translated the *De Corona* of Demosthenes, and the *Ethics* and *Politics* of Aristotle. The same is partly true of Scaliger (1540-1609), who passed the last 16 years of his life as Professor at Leyden.

Since there were two notable Scaligers, the father and the son, the identity of the one here in question might have been fixed through the forenames—Joseph Juste. But is not the passage dull even as occurring in a work of reference? No touch of colour! We are compelled to think of a Catalogue of Ships as it would be drawn up, not by a Homer, but by a Clerk to the Admiralty. Let it not be doubted, however, that Dr. Sandys, who wrote thus, had valid grounds for writing so; among them probably this: that he has dealt fully elsewhere with much of his subject. Yet he brings home to us that it is possible to carry condensation so far that the residuum is unpalatable or even nauseous.

Not always as we read did we feel this. Dr. Wilkins on education we found illuminative. From Prof. Sir Richard Jebb, in particular, we drew pleasure. A sentence of his (from an excellent paragraph, by the way) may serve to indicate that the language of a handbook need not perforce lack all distinction:—"For the subject-matter of textual criticism is the play of human thought and emotion in creating literature, and the subsequent play of human agency, or of chance, in defacing it." And, as to Homerology, how delightful it is to get, after many buffetings, some sort of stability from his cautious teaching! Often, while we lingered over the pages that he contributes, we caught ourselves desiring more. We should have liked him to expatiate, for instance, on the theme of Hellenism giving place to Byzantinism; and since he goes down to the reign of Justinian he might have talked a little of Procopius, who may be Byzantine, but who, upon occasion, can make his reader's blood course faster. Once only did Sir Richard irritate us. Could he not have devised some fitter term than "scholar" for the lying monk John Xiphilin called the Younger? No man should lightly bestow the proudest of his own titles.

But now to a conclusion. If there are imperfections to note in the "Companion," nevertheless, on the whole, it is a good book, worthy of English scholarship. Therefore we wish it "fair and prosperous voyage."

The Literature of the Highlands. By MAGNUS MACLEAN, M.A., D.Sc. (Price 7s. 6d. net. Blackie.)

Dr. Maclean, as we have seen, has already treated the literature of the various Celtic nationalities as a whole; he now deals specially with literature of the Highlands of Scotland in comparatively recent times because of "the greater divergence of production" associated with greater divergence of the Celtic peoples. In the present volume he keeps to the modern side of the Forty-Five, covering a period of a century and a half, which he reckons "the golden age of Highland poetry," and leaving to English Literature distinctly English books by modern Highland authors. Practically he breaks fresh ground; for Prof. Blackie and Dr. Nigel Macneill can be regarded as little more than pioneers, and Dr. Maclean's work differs from theirs in design and disposition. It is very welcome as a distinctive and able contribution to literary history.

Till the time of the Rising in '45, strange to say, "that part of the country—so full of the pathos and poetry of the past—had not a single original production of its own in print, if we except a vocabulary compiled by Alexander Macdonald. The Gaelic volumes in circulation did not exceed half-a-dozen, and these consisted of translations of the following religious works—Knox's Liturgy, The Psalter, Calvin's and the Shorter Catechisms, and the Confession of Faith." The written materials were similarly meagre. Moreover, the people had

been distracted by continuous strife—clan feuds, national convulsions, raids, and fighting. Yet poems and ballads and prose romances circulated through the straths freely by oral transmission. And the cruel day of Culloden ushered in a new order of peace, when the Gaelic genius, fostered by the oral tradition and free from warlike alarms, produced a literature in print, marked by a stronger mastery of the language, a larger power of expression, and a widely extended range of subjects—not only elegies and eulogies and war-songs, as of old, but the romantic cycle of Jacobite devotion, a passionate burst of love songs, an emotional response to Nature through all the seasons, and the soothing practice of religious poetry. In 1760 the tide of lyric effusion was reinforced by the epic stream of Ossian, whose impulse was distinctly felt for several decades. Very interesting is Dr. Maclean's brief reference to Jerome Stone, Rector of Dunkeld Grammar School, the gifted pioneer of Macpherson: he died at twenty-nine. "None of the nineteenth century poets," Dr. Maclean admits, "notwithstanding their originality and freshness, rival the great bards of the eighteenth": perhaps the Sassenach distractions are more vividly felt. It does seem singular that, in view of the Celtic reputation for fancy and imagination, the Highland poems of this class should be comparatively few. Nor have there been but rare and doubtful examples of philosophical and dramatic poetry: the nearest approach to dramatic representation in the older time being the dialogues of Ossian. Still more striking is the dearth of Gaelic prose: the best is attributed to Dr. Norman Macleod—father of a more famous son of the same name—whose style, according to Prof. Blackie, his translator, is "marked by the dramatic grace of Plato, and the shrewd humour of Lucian." Of the clans, "the Macdonalds, on the whole, figure as the most prolific contributors to Gaelic literature, "though the Macleans, the Macleods, the Mackays, the Mackenzies, and the Campbells have done well also." We are specially interested and pleased to note that "we owe most of the best of our Highland literature to men who, at one time or another of their lives, engaged in scholastic work."

We will not follow Dr. Maclean through his detailed treatment of the various aspects of Highland literature in separate chapters. We hope our readers will be attracted to do so for themselves. The treatment is ample and fair and always interesting. Perhaps most interesting of all is the chapter devoted to a careful review of the Ossian controversy, with a thoughtful estimate of the mental character of Macpherson. Messrs. Blackie have produced the volume in excellent style—a worthy pendant to "The Literature of the Celts."

Reformation and Renaissance, 1377-1610. By J. M. STONE. (Price 16s. net. Duckworth.)

Mr. Stone combines in a single volume—a spacious volume certainly—two great revolutionary movements that the "Cambridge Modern History" has difficulty in disposing of in two still more spacious volumes. His object, is less comprehensive: he takes his stand at the point of view of "the old religion," and represents the various main aspects of the Reformation and the Renaissance in relation to the Catholic Church and to the world at large, as well as their mutual reaction. However one may disagree with the results, one cannot but acknowledge that it is well to have a popular, and at the same time scholarly, presentation of the subject from Mr. Stone's standpoint. The volume is most liberally furnished forth, and the sixteen plates, representing the more notable personages of the two movements, add value and interest to the fluent and perspicuous narrative of events. We do not care to lay much stress of exception on the introductory chapter, which describes at disproportionate length, with considerable irrelevance, and in disjointed form, the condition of Europe at the close of the Middle Ages; nor yet on the frequent interruption of biographical details, anecdotes, or quotations. The personal interest, indeed, gives a more vivid interest to the narrative.

One may well admit that there were many isolated reformers within the Church in Germany and Holland in the fifteenth century, or even that "in Germany the evil state of the Church was largely owing to the evil state of the realm," without accepting such arguments as apologies for the Church. Wycliff's doctrines may have preceded Luther's theses even in Germany, and Geiler may have already preached faith and laid down a precise and clear doctrine of penance and indulgences; but how can such things subvert the essential efficacy of Luther's

work? In connexion with both Luther's and Erasmus's translation of the New Testament, Mr. Stone points to the many earlier editions available, and he pours hot scorn upon Froude for saying that "the living facts of Christianity, the persons of Christ and the Apostles, their history, their lives, their teaching, were revealed to an astonished world" by the version of Erasmus. Not in his text at the point of his criticism, but in the end of his Appendix list of early Bibles, he indicates their precise character: "these Catholic Bibles, all of them translations from the Vulgate." Having brought together these points, we quote a short passage of Prof. Pollard's on Luther in the "Cambridge Modern History," Vol. II., page 164:

The old error that versions of the Scriptures in the vernacular tongues were almost unknown before the Reformation has been often exposed, but it is not so often pointed out that these earlier translations were based on the Vulgate and thus reflected the misconceptions of the Church against which the Reformers protested. It was almost as important that translations into the vernacular should be based on original texts as that there should be translations at all.

It is useless to pursue the narrative of events in England or in other countries: the standpoint of the author continually causes disagreement. Yet there is much interesting matter in the midst of much perversity.

A Student's History of Scotland. By DAVID WATSON RANNIE, M.A. (Price 3s. 6d. Methuen.)

Mr. Rannie, an Oxonian Scotsman, sketches the main features of his country's history "from one definite point of view—namely, the relations between Scotland and England"—for the benefit of young students, and especially of such as already know the elements of English history. This is, no doubt, the main point of view, for the simple reason that, so far as political matters go, England was always on the Border and most usually keen to put a finger in the pie on the northern side; but there does not seem to be any cogent reason why it should be taken as the sole point of view. The attractions of Mary Queen of Scots and of Scottish Protestantism may have deflected other writers from "the main interest of Scottish history"; but the avoidance of these attractions need not deflect anybody else in some other direction. Mr. Rannie's fundamental principle "has obliged him to end his story in 1746, when the Union of Scotland and England was at last made finally secure." So much the worse for his principle. Sir Henry Craik has written the history of Scotland during a century after that date, and a very instructive history, too. Mr. Rannie says "the history of Scotland ceases, and the history of [Great] Britain takes its place"—a theory that we leave him to settle with his fellow-countrymen. However, the early stop gives more space for the period treated, and the important movements and crises are set forth with more than ordinary fullness and in lucid narrative. Mr. Rannie "has striven to tell his story from original sources"; but it is plain—say, from his chapter on the War of Independence—that his critical appreciation of the original sources falls short of the judgments he might have found in some modern "secondary authorities." His political estimates—especially his estimate of the Union and its results—do not always bear the imprint of experienced political thought. Still, the large outlines of fact are well drawn and the general bearings are graphically expounded. The book will be very serviceable for its purpose. There are four very helpful maps.

Siepmann's Primary French Course. Part II. Comprising a Reader, Grammar, and Exercises. (Macmillan.)

There is no need to recapitulate Mr. Siepmann's method, which, for brevity, we may describe as the half-way house between Sir William Smith and Prof. Rippmann. All that need be said is that it is admirably carried out in the present volume. The Reader, consisting of thirty brief passages relating the visit of an English boy to a French boy in Paris, has been specially composed so as to introduce the pupil step by step to grammatical forms and constructions. A story written under such conditions must necessarily bear the same relation to a story with no *arrière pensée* that *bouts rimés* do to poetry; but the author, if he dances in chains, has managed very skilfully to conceal them. Some of the renderings in the vocabulary might be more idiomatic—"when you have passed through the

school; right in the forest; dorsel; official plants"—and *honneur* is given as feminine.

The School Manager's Handbook, 1904-1905. By JOSEPH KING, M.A., Barrister-at-Law. (Edward Arnold.)

This is intended as a handy guide for the management of public elementary schools, with a reprint of the Education Acts of 1902 and 1903 and the full text of the Education Code of 1904. There are really few or no short books on the duties of managers of schools. Many managers who are new to their work often want a guide to help them to understand the Acts, and it seems to have been these considerations which induced the author to write these notes. We certainly think the book is very useful and will supply a want to the class to which it appeals. The letterpress is good and the style is clear and short. The first chapter consists of a useful, yet short, explanation of the different Local Authorities and their respective functions, and the author wisely points out that, though the Local Authority is the same as that under the Local Government Acts, yet all these Authorities will almost certainly have an Education Committee with executive power, with whom the school managers will have to deal directly, and that it will be to the advantage of the managers to promote a good understanding with this Committee. School managers will do well to read Section 6 of the Act of 1902 and Section 2 of the Act of 1903. The former refers to England other than the London area, and lays down the number of managers of the voluntary and the Council schools respectively; while the latter relates to the London area and provides how the number of managers is to be determined by the Borough Council, subject to the consulting of the Local Authority, with the approval of the Board of Education. A very important subject, and one we cannot too strongly impress on the attention of managers, is the proper provision for school buildings, and, in particular, as to light and air. Every part and corner of a school should be fully lighted, and the light should, as far as possible, and especially in class-rooms, be admitted from the left side of the schools. It has been forcibly pointed out that irreparable injury has been done to the eyesight of thousands of children owing to the neglect of these rules. Further, it is important that ventilation should be provided, apart from doors and windows. The above are taken from the rules prescribed by the Board of Education in planning and fitting up elementary schools, and we think the advice most sound and sensible, such as no manager can properly overlook. The book is not intended for specialists in the Education Acts; for these must go to a treatise, such as that of Sir Hugh Owen. But, as a good practical guide for the ordinary man, the manual can be highly recommended.

The Schoolmasters Yearbook and Directory, 1905. (Price 5s. net. Sonnenschein.)

The third issue of this "Yearbook" has grown in bulk and in comprehensiveness. Part I., giving general professional information, now extends to 500 pages, and Part II., with names of masters and lists of schools, to 558 pages. A new feature is particulars as to Minor Local Education Authorities. We have tested the volume in a variety of ways and not once found it lacking. We welcome the enlarged bibliography, but reviews of books seem to us out of place. The selection must be more or less arbitrary. The list of educational publishers has not been brought up to date, and half a dozen of the addresses are wrong. Mr. Humberstone is a most painstaking and accurate editor, and we hope that we may now look on the continuance of the "Yearbook" as assured.

The Teaching of German in Secondary Schools. By E. W. BAGSTER-COLLINS. (Price 6s. 6d. net. Macmillan.)

Mr. Collins, who is adjunct professor in Columbia University, gives the outgrowth of his experience as a teacher and lecturer, which, in its turn, was founded on his observation of teaching in various German schools. The method he recommends is at each stage reasoned out and connected with pedagogic principles. He is himself an eclectic and holds the balance fairly between the new and the old school, laying full emphasis on pronunciation and oral teaching and at the same time insisting that, for American students, the main aim in view must be to read German. It is a work that no teacher of German can afford to neglect.

The History of Art throughout the Ages. An Illustrated Record. By S. REINACH. Translated from the French by FLORENCE SIMMONDS. (Price 10s. net. Heinemann.)

Prof. Reinach's popular lectures, delivered at the École du Louvre, well deserve to be reproduced in English. To cover the history of art from eoliths and the pictures of cave men down to Rodin and John Sargent in a volume of three hundred pages is an impossible task; but it is quite possible to give, as it were, a genealogical tree, to indicate not only the relationship, but also what branches and what members of these branches will best reward further study, and to tell the pupils where to go for materials. Such a work no man is better qualified than Prof. Reinach to execute. In particular, the full bibliographies affixed to each chapter will prove invaluable to the art student. The

book is plentifully illustrated, and, though the insets are on too small a scale to be beautiful in themselves, they suffice to recall the picture to those who have seen it and to indicate roughly the type and character.

The Teaching of History; and other Papers. By H. L. WITHERS. Edited, with Biographical Introduction, by J. H. FOWLER. (Price 4s. 6d. net. Manchester University Press.)

This memorial volume is a grateful, though inadequate, tribute to a remarkable man cut off in the prime of life. His many friends will be glad to have, in a collected form, the chapter Mr. Withers wrote for Mr. P. A. Barnett's volume and other fugitive pieces. Further, the reminiscences of Mr. G. Macdonald and Prof. Alexander bring out different phases of a simple and very lovable character. The letters, on the other hand, are disappointing—genial, sensible, and unaffected, but dealing mainly with the commonplace and revealing nothing of the *vie intime*. The sad fact is that, from various impulses, all of them honourable, Withers was early drawn into the maelstrom of practical life, and, in addition to his professorial duties, undertook an amount of examining, inspecting, and hack work that would have fully occupied the whole time of an ordinary man. The wonder is how he retained to the last his vigour and his freshness, and, though we grieve our loss, we cannot count him unhappy to have perished in the light.

"Library of Devotion."—(1) *A Day Book from the Saints and Fathers.* Edited by JOHN HENRY BURN. (2) *Light, Life, and Love.* Edited by W. R. INGE. (Price 2s. each. Methuen.)

(1) There was room for a really good selection from the rich storehouse of Christian devotional literature such as is here, with excellent taste and discrimination, set forth by Mr. Burn. Mr. Burn's wide acquaintance with Christian literature of all departments has enabled him to compile a truly representative collection of apposite extracts for all the days of the year. Augustine, Ambrose, Chrysostom, Athanasius, Hilary, Ephraim, Thomas à Kempis, Teresa, Jeremy Taylor, Bishop Joseph Hall, and Fénelon are some of the names that appear in the selection. The book may be cordially recommended as an excellent example of its kind.

(2) This volume consists of "selections from the German mystics of the Middle Ages." All Mr. Inge's work has the charm of distinction. The present little volume contains a really admirable *catena* of representative passages from Eckhart, Tauler, Suso, Ruysbroek, and the "Theologia Germanica." This is preceded by an introduction, full of insight and fine exposition, dealing with "The Precursors of the German Mystics" (§ 1), "Meister Eckhart" (§ 2), "Eckhart's Religious Philosophy" (§ 3), "The German Mystics as Guides to Holiness" (§ 4), "Tauler" (§ 5), "Suso" (§ 6), "Ruysbroek" (§ 7), "The 'Theologia Germanica'" (§ 8), "Modern Mysticism" (§ 9), and "Specimens of Modern Mysticism" (§ 10). According to Mr. Inge, "nothing can prevent the religion of the twentieth century from being mystical in type. The strongest wish of a vast number of earnest men and women to-day is for a basis of religious belief which shall rest not upon tradition or external authority or historical evidence, but upon the ascertainable facts of human experience" (page lviii). By all who wish to understand and follow the movement of this vital tendency of modern religion Mr. Inge's book is one to be not merely read, but possessed. It is, besides, full of interest and charm.

"Finsbury Technical Manuals."—*Elementary Telegraphy and Telephony.* By A. CROTCH. (Price 4s. 6d. net. E. & F. N. Spon.)

This very elementary account of telegraphy and telephony will be found useful by operators who desire to know something of the construction and theory of the instruments they use. No knowledge of magnetism or electricity on the part of the student is assumed by the author, and nearly half the book is given up to a very elementary account of these subjects. The remainder of the volume is more technical in character and describes some of the principal instruments in common use and the methods adopted in duplex telegraphy. There are also short chapters dealing with submarine telegraphy and the methods of testing lines for faults. We think that the author might, with advantage, have been more explicit in his statements on pages 8 and 16 regarding steel and its properties: not only are they very vague, but are likely to mislead. The area of a circle is given on page 81 as $2\pi r^2$ instead of πr^2 .

Electricity and Magnetism, Theoretical and Practical. By C. E. ASHFORD. (Price 3s. 6d. Edward Arnold.)

In order to obtain a proper grasp of the principles of magnetism and electricity, it is quite as necessary for the individual student to work through a suitable selection of experiments, qualitative and quantitative, as it is for the beginner in chemistry to work in the laboratory. Mr. Ashford's book is essentially one to be used in the physical laboratory, and is modelled on more or less heuristic lines: those portions of the subject which do not easily lend themselves to this method are dealt with in the usual text-book manner. The apparatus required is throughout very simple and inexpensive. We agree with the author's contention that the early use of the amperemeter and voltmeter should be permitted: every teacher of the subject must be familiar with the vague ideas possessed by most beginners with respect to electrical magnitudes, and these misty notions can only be dispelled by practical

acquaintance with the units. A boy who has worked steadily and intelligently through this book will have laid a sound foundation for more advanced reading in the future.

Electric Lighting and Power Distribution. Vol. II. By W. PERRIN MAYCOCK. (Price 7s. 6d. Whittaker.)

This is the second volume of a comprehensive work on electric engineering which is intended to provide beginners with an elementary text-book covering the requirements of the Ordinary Grade Examination of the City and Guilds of London Institute. The present section deals with dynamos, motors, meters, secondary cells, transformers, and systems of supply. The treatment is simple and the exposition clear, although it must be understood that an acquaintance with the elements of electricity is taken for granted. One of the chief features of the work is the abundance of diagrams and illustrations, which number more than four hundred and are uniformly excellent. We notice, in the text of page 77, that the references to Figs. 34 and 35 should be to Figs. 35 and 36. We think that the inclusion of the processes for the manufacture of calcium carbide and carborundum (page 456) under the heading of "Electrolysis" is misleading to a beginner: in these cases the action which proceeds is merely an ordinary chemical reduction at the high temperature afforded by the electric arc. The work can be thoroughly recommended to that class of student for which it is intended.

Elements of Electromagnetic Theory. By S. J. BARNETT. (Pp. 480; price 12s. 6d. net. Macmillan.)

Advanced students of magnetism and electricity who need a thoroughly good introduction to the fundamental principles of electromagnetic theory will find that this volume supplies their wants in a very satisfactory manner. Naturally, the subject is treated rather from the mathematical than from the experimental standpoint, and the student should supplement his reading by reference to works written from the second point of view. The subject-matter is quite up to date and logically arranged, and the printing and illustrations leave nothing to be desired.

Treatise on Thermodynamics. By Dr. MAX PLANCK. Translated by ALEXANDER OGG. (Price 7s. 6d. net. Longmans.)

The applications of the principles of thermodynamics to physical and chemical problems are so numerous and important that every fairly advanced student of those subjects must have some acquaintance with it. Prof. Planck's work has long been a standard text-book on thermodynamics: it has now been made more accessible to English readers by Dr. Ogg's translation, and is a welcome addition to the rapidly increasing library of translations of standard scientific works by foreign authors.

A Preliminary Course of Practical Physics. By C. E. ASHFORD, M.A. (Edward Arnold.)

The Head Master of the Osborne College has put before us an excellent little handbook and one well adapted for the use of young students who have never yet penetrated the mysteries of a laboratory. As the author explains, the book was first privately printed for use at Harrow and has been used there for about six years. Each boy works through the book in one term, but the time apparently given each week to science at Harrow, as at most of the great public schools, seems absurdly small. However, the book, no doubt, is well suited for its purposes: it provides a large number of easy experiments to be worked out by the student. The description is so complete that it scarcely seems necessary for the learner to derive any knowledge from the teacher. We are glad to see that the author insists strongly on the importance of beginners gaining accuracy and rapidity in both measuring and weighing, and we do not think that there are by any means too many of such experiments included in the book. The apparatus required is simple and inexpensive, and, in the hands of a teacher of experience who may predict the mistakes likely to be made by boys, the book should prove useful and instructive. A feature of the book is that the student enters up in it his results obtained as he goes along, and this obviates the necessity of his having a special note-book with him. We also think that the book will be useful both to mathematicians and physicists who are endeavouring to work their subjects together with some idea of co-ordination, and, if it be for this alone, we certainly advise teachers to get the book and study it.

Botany Rambles. Part II. *In the Summer.* By ELLA THOMSON. (Horace Marshall & Son.)

The writer has now given us the second part of this charming series, and here, too, she discloses her name. As we have before said, she is to be congratulated on the result attained. It is not easy to write a simple book well, but in the book before us we find an interesting and natural description of many of the ordinary objects in the country-side during the summer time, and yet the whole thing is done quite simply. The writer gives us pictures of the well known leaves, such as that of the beech, the oak, and the lime, and explains the various functions of the different parts of the leaf. The manner in which the pear seed is fertilized is well yet simply described, and the writer does well to bring to the minds of young observers the important part in this respect played by bees and other insects as indirect agents as they fly from

blossom to blossom. The writer points out how, in order to get the sunshine, some trees have longer branches near the base than higher up; and, again, how the willow seed, owing to its peculiar construction, is blown by the wind to a distance from the parent tree in order that it may strike root some distance away from the shade of the parent tree; and, again, how in self-defence the holly has stronger prickles lower down than at the top. In conclusion, we may say that this little work is full of good things, simply told, within the compass of not much more than a hundred pages, and we shall be glad to read the succeeding parts in this subject from the writer's pen.

Statutes of Practical Utility passed in 1903. By J. M. LELY, M.A., Barrister-at-Law. (Sweet & Maxwell; Stevens & Sons.)

The author has included, with notes thereon, twenty-four out of the forty-seven public statutes passed in the Session of Parliament which terminated last August. Considering the multiplicity of modern statutes, we scarcely know what the practitioner would do without some such book as this, published annually, for of course it is in continuation of the well known "Chitty's Statutes." The book also contains certain incorporated enactments and selected statutory rules. We are principally concerned with the three Acts dealing with education, of which the principal one is (c. 24) the Education (London) Act, 1903. The Act provides for the application of the Education Act of 1902 to London, and for the management of schools provided by the Local Education Authority, which is now for London the London County Council. The number of the managers and the manner in which schools within any metropolitan borough are to be grouped under one body of managers are determined by the Borough Council after consultation with the London County Council and subject to the approval of the Board of Education. Two-thirds of such body of managers are to be appointed by the Borough Council and one-third by the London County Council. Section 5 enacted with certain reservations that the Act should come into operation on the first of May of this year. And hence from that day the old School Board for London has ceased to exist. The author has conveniently included in the book the Elementary School Code of 1903 to be read in conjunction with the Act. A system of this kind is very beneficial in view of the complicated character of recent educational legislation, and, whatever may be the general opinion as to the principal Act of 1902 and the Act of 1903, we must admit that the general arrangement is excellent. The recent Acts relating to motor cars, pistols, and poor prisoners are also included; but these it would be somewhat outside the scope of the present review to criticize.

The Fourth Dimension. By C. HOWARD HINTON, M.A. (Sonnenschein.)

To the philosophic mind this book is quite fascinating. The author has carried out his task in a pleasant manner. He says himself in the preface that a lack of mathematical knowledge will prove of no disadvantage to the reader; for no mathematical processes of reasoning have been used. He commences with the analogy of the plane world, and takes the reader by inductive processes from plane to solid and from solid to four-dimensional space. The chapters on "The Higher World" and "Evidences for a Fourth Dimension" are particularly stimulating. We are not quite sure that we agree with his application to Kant's "Theory of Existence." The book contains on its frontispiece coloured views of the "tesseract" or the simple hypothetical four-dimensional figure. We can well recommend the book to thoughtful readers.

Bird Life in Wild Wales. By JOHN A. WALPOLE-BOND. (Price 7s. 6d. Fisher Unwin.)

A pleasantly written record of bird-nesting, mostly in diary form, illustrated with photographs by Mr. Oliver Pike. Mr. Walpole-Bond is not only an ardent sportsman but a keen observer, and he contributes much fresh information as to the *habitat* of the kite, raven, buzzard, pied flycatcher, and other rare and fast disappearing species. He is judiciously careful not to betray the exact position of his favourite haunts, and is himself more intent on observing than on collecting. His advice to take a whole clutch of eggs if any at all, on the ground that the birds will then rear a whole second brood, seems to us dangerous doctrine. At any rate, it can only apply to the early season. The table of observations on birds and their nestings seen by the author between March 1 and July 1, 1902, includes 118 species, from the raven, first egg March 1, to the nightjar, first egg June 15.

"Allyn & Bacon's Series of School Histories."—*A History of England.* By CHARLES M. ANDREWS. (7½ x 5 in., pp. x, 588, illustrated; price 6s.)

Mr. Andrews is Professor of History in Bryn Mawr College, and his book is one of a capital series. It tells its story simply, clearly, impartially, and interestingly. It is well informed, accurate, and scholarly; and from the point of view of proportion, perspective, and skilful arrangement of material it deserves a hearty welcome. Prof. Andrews is well aware that his task has been to trace "through a long period of time the career of a people the greater part of whose history is our history, and whose early struggle to win constitutional liberty is

our heritage as well as theirs." This is the right, and indeed the only sane, spirit in which to approach the subject; and it is evenly and equitably maintained throughout. Like most American school books, its general outfit is excellent; but, alas! also like most American school books, it is very heavy to hold in the hand—a fact due to the heavy loading of the paper used. The maps, genealogical tables, illustrations, and list of source books are all that could be desired. At the end of each chapter we are given a full and useful bibliographical note; and the book closes with a helpful list of books for practical use in schools, a chronological table, and a full index. Two characteristics make this book specially welcome and interesting—its complete freedom from the covert sneering and depreciation still to be found, but less frequently than heretofore, in such books when written by citizens of the United States, and the entire absence of that tone of half-conscious self-complacency to be found at times in histories of England written by Englishmen. In fact it recognizes history as history, and not as a weapon of partisan warfare or party politics.

The Wonderful Century: the Age of New Ideas in Science and Invention. New Edition. By ALFRED RUSSELL WALLACE. (7¼ x 5½ in., pp. xii, 527, illustrated; price 7s. 6d. net. Sonnenschein.)

Most of our readers will doubtless already be acquainted with this interesting book. The edition before us has been revised and largely rewritten—to such an extent that it may be looked upon as substantially a new work. The most important addition is that of four new chapters on Astronomy and one on Electricity; while the chapters on Locomotion by Land and Sea, on Photography (especially as regards its application to artistic illustration—e.g., in photogravures and Woodburytype prints), and on Chemistry have been much enlarged and copiously illustrated. The most important omission is that of the very long attack on Vaccination—which, to our mind, was out of place in a book of this kind. And we should not be sorry if in the next edition some more of the chapters of Part II. (which contains the matters entitled "Failures") followed the example of that on Vaccination and departed. There have been more "failures" than those mentioned; and it is not generally agreed that all of those so condemned are failures. The book, as a whole, is very well informed and interestingly written, and most of the 107 illustrations are good in themselves and all are very much to their purpose. It will form a most acceptable present to older boys and girls and to that strange wild-fowl the "general reader." Nor can we recommend it more strongly than by mentioning that it is written by the author of "The Malay Archipelago," "Travels on the Amazon," and "Island Life."

"Bell's Handbook to Continental Churches."—*Bayeux.* By the Rev. R. S. MYLNE, M.A., B.C.L. Oxon., F.R.S. Scots, F.S.A., &c. (G. Bell & Sons.)

So many English and American tourists visit Bayeux that this addition to Messrs. Bell's excellent series of handy guides to Continental churches is sure of a welcome. Following the arrangement of its predecessors, this little volume includes a description of the cathedral and other buildings of interest both in the city and in the immediate neighbourhood, and it has an additional chapter on the tapestry, with a list of the fifty-eight scenes which it represents. The illustrations are numerous and good. The book, however, does not please us so well as most of these guides. Where did Mr. Mylne find that Bishop Odo received the Earldom of Hereford, or that there was an Earl of Harcourt, raiding in Normandy, in the reign of Edward III.? Of the first of these statements we can make nothing. The noble described here as the Earl of Harcourt was Godfrey of Harcourt, Lord of Saint Sauveur, slain in 1356, a son of John III., Count of Harcourt; no Earldom of Harcourt existed until the eighteenth century. The architectural account of the cathedral is less full than could be wished, and too much space is devoted to talk about the sculptures in two panels which, though well worthy of attention, are not of a unique kind. Above all, Mr. Mylne should have written in a more sober and more manly style. His ecstasies and exclamations—"How rich is their workmanship! How exquisite is their design!"—are out of place, and so are such sentences as "Be sure to notice his tiny little toes!" And the same must be said of his wordy method of calling the tourist's attention to the *lanterne des morts*. "What," he writes, "is this odd-looking turret-like little thing? Can it be an old chimney from some nobler edifice of days gone by that has somehow got into this strange position? Are those narrow apertures to let the black smoke escape? No! It is nothing of that kind." These guides are not meant for babies, and should not be written in the style of the sermon on Mother Hubbard.

The Book of Isaiah according to the Septuagint. Translated and Edited by R. R. OTTLEY, M.A. Vol. I., Introduction and Translation, with a Parallel Version from the Hebrew. (Clay.)

This very useful volume consists of a parallel translation of the Hebrew and Greek (LXX.) texts of Isaiah, with short critical notes appended, and preceded by an introduction. The latter (occupying pages 1-58) deals with (a) the early history of the LXX., (b) text of the LXX. in Isaiah, (c) methods of rendering, and (d) differences between the LXX. and the Hebrew. There are some excellent classified

lists, giving details. The text here followed is that of A as against B, which is regarded as (in this book) decidedly of an inferior character (pages 9 and 10). The mixed character of the text attested in all the MSS. is, however, rightly insisted on. To any one who has ever worked at the subject in detail this fact is painfully evident. Even the value of the old Latin as a criterion—so often insisted upon by Mr. Burdett—is doubtful, so elusive and inconsistent are the actual data. The possibility of a truly critical reconstruction of the LXX. text is yet a long way off. Mr. Otley's volume, while not offering any very brilliant or startling results, is scholarly and thorough. The appearance of the second volume, which is to contain the Greek text, with selected variants and full philological and critical notes, will be looked forward to with interest.

Dent's "Modern Language Series."—*Features of French Life.*

Second Part. By FRANK R. ROBERT.

The first chapters are headed—"Money," "Postage," "A Fair Day," "Vintage." These will indicate sufficiently the matter. Illustrations abound; those on post-cards, visiting cards, actual bills are particularly to be commended. There is the usual *questionnaire*, with notes on derivations, &c. The book has been well planned and would furnish, by itself, a good term's work for beginners.

La Mise de la Marquise; et, La Fille du Chanoine. Par E. ABOUT.

Edited by O. B. SUPER. (Price 2s. 6d. Ginn.)

We are glad to see, in a well bound and well printed edition, these two novelettes of About—not too hard French for beginners, but thoroughly idiomatic. Prof. Super has supplied the needful explanatory notes without the usual padding of grammar and a vocabulary.

The Platonic Conception of Immortality. By R. K. GAYE.

(Price 5s. net. Clay & Sons.)

This, the essay which gained the Hare Prize in 1903, was well worth publication. Mr. Gaye attempts to show how Plato's conception of immortality grew out of—and was, as it were, as a corollary to—his theory of ideas; how, in other words, his philosophy—or, rather, his theology—had an ethical basis. Incidentally, he points out the curious similarity between Plato's doctrine and that of Browning. The preface gracefully acknowledges his indebtedness to his teacher, Dr. Henry Jackson.

The Story of English Literature. By ANNA BUCKLAND.

New and Enlarged Edition. (Cassell.)

Since the first edition appeared in 1882 this deservedly popular manual has been reprinted no less than eleven times. There is no attempt at subtlety or profound criticism, but plain common sense is the distinguishing characteristic. The book is brought down to late Victorian times, but, if we are not mistaken, Mrs. Ritchie has the honour of being the only living author mentioned.

Emile et Hélène. A French Primer. By Mrs. J. G. FRAZER.

(Price 1s. Macmillan.)

Mrs. Frazer's name is so well known that it almost suffices to say, "Here's another French play book, as good as the rest." We must add, however, that the book is not all play. The dialogues are followed by a short grammar and exercises. Mrs. Frazer does not believe in "the present fad of all French," but she is so far a convert to the New Method that the exercises are designed to be done orally, not written.

Larousse Dictionnaire complet illustré de la langue française.

(Price 2s. 6d. net. Dent.)

Messrs. Dent have made arrangements with the French publishers whereby they are enabled to supply separately the first part—i.e., the dictionary proper—of "Larousse": in France it is a common noun as much as Bradshaw is in England. We should like to see every pupil in his second year of French study provided with a copy. There would then be no need for the vocabularies of Messrs. Dent's Readers.

The Holy Roman Empire. By JAMES BRYCE. A New Edition, Enlarged and Revised throughout. (Price 7s. 6d. Macmillan.)

No prize essay, we are safe in saying, has ever enjoyed such popularity or passed through so many editions. If we reckon reprints, this is the twentieth, and it has been translated into German, Italian, and French. The chief additions in this last issue are a chapter on the Byzantine Empire and a concluding essay on the constitution of the new German Empire. Prefixed are chronological tables of Emperors and Popes and of important events, which occupy forty-eight pages. We have, besides, three inset maps showing the extent of the Empire at the deaths respectively of Charles the Great, Frederick I., and Maximilian I. The essay has grown into a history, but it keeps its original charm—the clear and strictly defined boundaries of a single idea and institution.

Horace. Vol. I.: *The Odes and Epodes.* With a Commentary by E. C. WICKHAM. (Price 6s. Clarendon Press.)

This edition may be briefly described as the school edition of 1891 brought up to date. The text is that edited by Dean Wickham for "The Oxford Classics," and the notes have been revised in accordance with the author's library edition. We have more than once awarded

Dean Wickham the palm among English commentators on Horace, and in our opinion he still holds it. We would call his attention to Mommsen's interpretation of Ode III. ii., to be found in the last volume of his "Addresses."

History of the High School of Stirling. By A. F. HUTCHINSON.

(Price 21s. Stirling: Eneas Mackay.)

This handsome volume is at once a record of eight centuries of Scottish education and a worthy monument of a distinguished Rector of the High School, who died before the task—which occupied his thoughts during his thirty years of office, and to which he devoted his whole time after his retirement—was quite completed. For a student of the educational history of Scotland—and most of what is best in English education has come to us from Scotland—this monograph is of the greatest value. As Dr. Robertson, in the short accompanying memoir of the author, remarks, this carefully compiled account of Reformation and sub-Reformation schools explains how Scotland so long held the foremost place in Europe in respect of its educated democracy.

The Glamour of the Earth. By G. A. B. DEWAR. (Price 6s. net.

George Allen.)—This is not a book to read straight through, but to browse on here and there at one's pleasure. Those who would revive memories of woods and downs which they have loved should be grateful to a writer who has conveyed, in this record of country sights and sounds, some of the spell cast on him by Mother Earth. The real charm we find in so many of the pages make some opinions expressed in the book the more astonishing. Mr. Dewar tells us he has found more good in the thrush's song at nightfall than in Shelley's "Skylark." We do not quarrel with this plain statement of fact. But there follows: "to rank Shelley's 'Skylark' and 'West Wind' with the bird and the might of melody which inspired him would be to put literature on a level with life, to take the reflection for the substance." We wonder what "literature" and "life" connote here, or whether the writer has ever considered that picture of the poet as one who did

"Nor hear nor see what things they be—

But from these create he can

Forms more real than living Man."

It savours of flattery to say that Mr. Dewar is, if serious, fouling his own nest. The illustrations, by R. V. A. Rouse, are good—in particular, the frontispiece.

The Local Examination Physiography. By W. J. PERRY, M.A., LL.D.

(Kelle Brothers.)

This is an excellent little book and is well adapted for the purpose for which it is written. The facts are put very clearly and the diagrams are clear. It gives the reader all he wants without going too fully into details. At the end there are several papers included which have been from time to time set at the respective Oxford and Cambridge Local Examinations. The three chapters on the atmosphere seem to us to be well worthy of the reader's attention. In reading the book, however, we have been inconvenienced by not seeing the subject of each chapter put clearly at the top of each page.

The Story of the East Country. By E. S. SYMES. (7 × 4¾ in., pp 255; price 1s. 6d. E. Arnold.)

The series of readers of which this book forms one volume is an excellent one. It tells us the story, or stories, of Norfolk, Suffolk, Essex, Hertfordshire, Huntingdonshire, Bedford, Cambridge, and Lincoln—of East Anglia, in fact. Mr. Symes, it would seem, takes down the county histories of these shires, extracts all the most telling and interesting stories, and then weaves them into the story of a small book of 250 pages. The work is excellently done, and makes a most charming reading-book—well printed and tastefully illustrated. We have seen two or three other volumes of the series, and all are admirable. We recommend the series very heartily to all schoolmasters and schoolmistresses. The age of the pupils for whom the books are suitable would appear to be about eleven and over.

A Book of French Songs. Selected and Edited by LOUIS A. BARBÉ. (Price 6d. Blackie.)

M. Barbé gives us in a cheap and convenient form twenty-three of the most familiar French songs and nursery rimes with the music: "The Bridge of Avignon," "The King of Yvetot," "Malbrough on the War-path"—all our old favourites. Those who, like the present reviewer, have marked the beneficent effect of class singing on French pronunciation will wish this song-book the wide popularity that it deserves.

The Addison Temperance Reader. By W. FINNEMORE. (Price 1s. 6d. Addison Publishing Co.)

A very effective "Temperance Reader" for elementary schools. It is, of course, one-sided, and we think it dangerous to quote Scripture without a hint that there is an equal array of texts on the other side; but there is no ranting, and the lessons are, as they should be, mostly in the form of anecdotes. There are useful supplementary chapters on the evils of youthful smoking.

Griechisches Elementarbuch. Von KARL SCHENKL. Nineteenth Revised Edition. (Price 3s. net. Williams & Norgate.)

A Greek accident in German must be a white elephant in England, but we wonder the publishers have not thought it worth while to translate, or better to adapt, a work so well planned and graduated and so justly popular in its land of birth.

An Elementary American History. By D. H. MONTGOMERY. (Illustrated; price 3s. 6d. Ginn.)

Mr. Montgomery is the author of the "Leading Facts of History Series," some volumes of which we know and like. This small book tells, in a short continuous narrative, the history of the United States in a form suitable to the wants of elementary pupils. It seems to us well done.

Messrs. E. J. Arnold (Leeds) send us a set of Registers for Pupil-Teachers. No. 1, price 1s. net, fulfils the requirements of Art. 8 (c); No. 2 (a), (b), (c), of Art. 13 (d). (a), price 2s. net, is a Class Register Record-book; (b), price 1s. net, is a Record of individual conduct and progress; (c) is an Admission Register—500 names 6s. net, 1,000 names 10s. net. The books are on good paper and strongly bound.

THE TEACHERS' GUILD OF GREAT BRITAIN AND IRELAND.

[By a resolution of the Council, of June 19, 1884, "The Journal of Education" was adopted as the medium of communication among members of the Teachers' Guild; but "The Journal" is in no other sense the organ of the Guild, nor is the Guild in any way responsible for the opinions expressed therein.]

The Council met on December 17, 1904. Present: Mr. S. H. Butcher (Chairman), Mr. H. Courthope Bowen, Miss H. Busk, Mr. G. F. Daniell, Miss F. Edwards, Mr. C. Granville, Mr. J. R. Langer, Mr. J. W. Longsdon, Mr. F. J. Matheson, Miss E. Newton, Mr. F. Storr, Mrs. J. S. Turner, Mr. W. Trevor Walsh, Prof. Foster Watson, and Mr. J. S. Wise.

The report of the Political Committee on the proposed remodelling of the Teachers' Register was considered, and modified in one or two respects, the decision of the Council being that the following alterations are desirable:—(1) That no additional names be entered on Column A; (2) that the Register consist of a single column, with the following columns appended: (a) Address, (b) Date of Registration, (c) Training Diploma, &c., (d) Academic Qualification, (e) Past Experience, (f) Present Employment; (3) that the minimum academic qualification at starting be the London University Matriculation Examination or its equivalent; (4) that this academic qualification obtain only for three years after its establishment, and that the Board of Education, acting on the advice of the Registration Council, be empowered, from time to time, to raise the standard; (5) that the other qualifications for the permanent Register, as to experience and training, be retained, but so modified as to include primary training colleges and experience in primary schools; (6) that the Regulations be so framed as to admit the registration of University teachers and professors and lecturers in training colleges.

It was also agreed that no difference of type should distinguish graduates from non-graduates on the Register.

[N.B.—A further modification of these proposals was made by Council on February 2. See below.]

A report from a joint sitting of the Finance, Education and Library, and Organizing Committees on the development of the *Teachers' Guild Quarterly* was considered. The report proposed that the *Quarterly* should be priced at 6d. for sale to non-members, and that certain associations be approached to find out whether they are willing to take space in the paper, on certain terms, for the publication of their proceedings. The report was adopted.

A report from the Modern Languages Holiday Courses Committee, setting out further the proposed arrangements for the courses in 1905, was considered. Mrs. J. S. Turner was added to the Committee on their request for the appointment of a lady.

A cordial vote of thanks to Miss H. Busk and Miss Escott, Head Mistress of the Sheffield High School for Girls, who had represented the Guild on the National Council of Women at the York meeting of the National Union of Women Workers, was passed.

Two applicants for membership of the Central Guild and three for membership of the Bournemouth Branch were elected.

The thanks of the Council were voted to the Committee of the Joint Agency for Assistant Masters for the repayment of a substantial part of the sum advanced by the Guild under a guarantee, in 1899, to help meet the deficiency in the accounts of the Agency, the repayment being in the nature of the discharge of a debt of honour, not of legal obligation.

A Congress of members of Council and officers of the Central Guild and Branches was held on January 13, 1905, in University Hall, Gordon Square, London, W.C., under the presidency of the Chairman

and Vice-Chairman of Council. The programme was published in the *Teachers' Guild Quarterly*, Dec., 1904 (pp. 45, 46). There was a good attendance of members of Council and of the Central Guild, but not more than ten branches—viz., Bath, Bradford, Brighton, Croydon, Folkestone, Guernsey, Ipswich, North Wales (Bangor), Oxford, and Worcester and Malvern—were represented, attendance having been found impossible by many officers at that date, when, in several places, the schools had already reopened.

On the subjects of the remuneration and tenure conditions of teachers, the Chairman said that they were questions of great importance to the whole nation. Salaries were too low in primary and in secondary schools, and the supply of teachers was short in both. On the whole, the secondary school teachers were worse off than the primary. Their tenure was precarious, few had any pensions. In some high schools salaries were falling slightly, though the requirements as to qualifications were rising. These conditions were the main causes of the short supply of teachers at the present time. This shortage had been preceded for many years by a fall in the academic qualifications of assistant masters in secondary schools. The case of the women teachers was more alarming still than that of the men. The minimum initial salary should be higher, with frequent increments and a system of pensions. Superannuation should carry a pension with it always. Salaries might be raised in a few cases by an increase of school fees; but the increase must mainly be by rates and Treasury grants; the former was the more likely way just now. This was the time to impress public opinion on these matters. The new Local Authorities were open-minded at present. They should be approached as business men, who would get the article that they wanted if they paid a proper price for it. Men and women of no ordinary personality were required for teaching. We could prove to Local Authorities that present salaries were on an economically unsound basis. The demand for better conditions must not be a trade union demand, but the expression of a national need. Impartial persons outside the teaching profession, as well as teachers, should press home this matter. It would be a national danger if shortage of supply of teachers be made up by a lowering of standard. Very large sums were spent on school buildings and appliances; but these were only externals. The whole structure of education depended on the teachers—the *spiritual* fabric. We must, before it is too late, do what we can to avert a national peril.

The Vice-Chairman emphasized the main points in the Chairman's address, and dwelt on the entirely new relation established between schools and Local Authorities. He found difficulty in seeing how the money for the improvement of salaries was to be provided, as the rates were at breaking point in many areas. We must also remember that grants involve control. He asserted that £150 a year, non-resident, should be the minimum starting salary of assistant masters in secondary schools, and added that, in his experience, provident pension schemes are easier to work than superannuation schemes in ordinary schools.

In the discussion it was pointed out that, by its composition, the Guild is the body best qualified to press the improvement of tenure conditions on school authorities.

The Congress, by a show of hands, was unanimous in support of the proposal of Council to take up this matter on the lines laid down.

The subject of the remodelling of the Teachers' Register was introduced by Mr. H. Courthope Bowen, M.A., Vice-Chairman of the Political Committee, and the Vice-Chairman of Council. Mrs. Bryant, D.Sc., and several others took part in the discussion. Ultimately it was decided to ask the Council to consider the scheme already sketched in the letter which precedes this summary.

By a show of hands the Congress unanimously approved the general idea of remodelling the Register.

Mr. Clifford Granville, B.A., introduced the question of the material reduction of the number of external examinations, and explained the suggestions of the Consultative Committee of the Board of Education for a system of school certificates. The proposed action of the Guild under this head was supported by the whole Congress.

The Chairman of the Education and Library Committee (Mr. G. F. Daniell, B.Sc.) introduced the question of the proposed revival of the work of the Education Society within the Guild, and the part that the Central Guild and Branches can take in this, and the Congress was again unanimous in supporting the scheme.

The questions connected with the internal position and present needs of the Guild were introduced by Miss H. Busk, Chairman of the Organizing Committee and member of the Finance Committee, and the General Secretary, under five heads, as follows:—(1) The financial position of the Guild (with elucidatory tables of figures); (2) the attendance of Branch representatives at Council meetings; (3) the local distribution of Guild publications; (4) the increase of membership by organized local effort in all parts of the Guild; (5) the improvement of the *Teachers' Guild Quarterly*, as the organ of the Guild, by the regular communication of Central Guild and Branch news of all sorts.

A strong appeal was made by Miss Busk for organized local effort to increase membership in order to strengthen the Guild for the new work already approved. Stress was laid on the increase of local interest and influence which would follow on a better attendance of

Branch representatives at Council meetings, and it was urged that the interest of individual members would be greatly increased if all publications of the Guild sent out from the head Office were promptly distributed among all members in every Branch. A suggestion was made that Branches with substantial balances in hand should contribute to general expenses from such balances. The expenditure of the Guild during the last six years was shown to have been kept down scrupulously, with no increase, even where an increase, if possible, would have been most desirable.

It was clearly shown to the Congress that an increase in annual income to the extent of £200 or £250 is necessary if the Guild is to carry on its work at all effectively.

In the interval between the morning and afternoon sittings an excellent luncheon was provided by the House Committee of the Guild, assisted by two or three ladies who kindly gave both time and presents of food.

The Council met again on February 2, 1905. Present: Mr. S. H. Butcher (Chairman), Miss H. Busk, Mr. Collar, Mr. G. Daniell, Miss F. Edwards, Mr. J. R. Langler, Mr. J. W. Longsdon, Mr. F. Matheson, Miss Rigg, Mr. F. Storr, the Rev. A. F. Titherington, Mrs. J. S. Turner, Mr. Arnold Turner, Mr. J. Wise.

The Master of University College, Oxford, the Rev. J. Franck Bright, D.D., was unanimously elected President of the Guild for the year 1905 in succession to Sir Oliver Lodge.

Sixteen applicants for membership were elected: Central Guild, 7; Branches, Bath and East Somerset, 6; Ipswich, 1; Manchester, 2.

Miss H. Busk, Miss Edwards, Mr. Matheson, and Miss Newton were appointed as the representatives of the Teachers' Guild on the Committee of the Joint Agency for Women Teachers for the year 1905.

Miss H. Busk and Mr. Daniell were appointed as delegates of the Guild to the Conference on School Hygiene in the University of London.

Miss Hill, Head Mistress of the High School for Girls, Peterborough, was appointed a Local Correspondent of the Guild for Peterborough.

The thanks of Council were unanimously accorded to the ladies who had provided the luncheon at the Congress without any cost to the Guild.

In accordance with a request of the Congress on January 13, initiated by Mrs. Bryant, the Council reconsidered their suggestions as to the remodelling of the Teachers' Register. It was decided to modify the scheme set out at the last meeting of Council by establishing a distinction between two standards of academic qualification, the higher being that of a University degree, or its equivalent; the lower, that of the ordinary Honours Certificate of the Cambridge Higher Local Examination or of the Intermediate Examination in Arts and Science of the University of London, or of the Government Certificate Examination for Teachers in Elementary Schools.

It was decided to send out a circular letter, submitted by the Organizing Committee, embodying the programme set out before the Congress, to the officers and all members of committees of the Central Guild and Branches, with a view to securing united work in all parts of the Guild in support of the programme. The letter contained suggestions as to the action to be taken in different localities, and was signed by the Chairman and Vice-Chairman of Council. It was also decided to send a short summary of the proceedings of the Congress with the circular letter.

Permission was given to the Holiday Resorts Committee to publish "Holiday Resorts" on March 15 in the present year, and on June 15 in 1906. The latter date will probably be the regular one after 1905.

CENTRAL GUILD—LONDON SECTIONS.

A. *Saturday, May 20.*—At Aske's Haberdashers' School, Westbere Road, West Hampstead. Social afternoon, from 3.30. Section C. invited.

C. *Monday, March 27.*—At 81, Priory Road, West Hampstead, N.W. Lecture by H. B. Garrod, on "The Desirability of teaching Classical Mythology and Antiquities to School Pupils who do not study Greek and Latin."

D. *Friday, March 17.*—At Bedford College, York Place, Baker Street, W. Conjoint Meeting. Limited number of tickets in hands of Hon. Secretaries of the different Sections. Lecture by the Rev. Canon Beeching, Litt.D., on "The Spiritual Teaching of Shakespeare." 8.15 p.m.

E. *Tuesday, April 11.*—Visit to the Royal Drawing Society's Exhibition at 50 Queen Anne's Gate, S.W., with a "Talk" by T. R. Ablett, Esq., Hon. Director.

Friday, May 19.—At 133 Queen's Gate, S.W. Lecture on "Parasitism," by A. Beresford Kingsford, Esq., M.R.C.S. 8 p.m.

BRANCHES.

Ipswich.—The members of this Branch met at the High School, Ipswich, on Saturday, February 18. Miss E. B. Harrison, Head Mistress of the Endowed School for Girls, and Vice-President of the Association, presided over a large gathering, which included Miss Bentinck-Smith, M.A., Girton College, Cambridge; Miss E. J. Notcutt, Ipswich High School; Mr. T. E. Cattell, Head Master, Boys' Middle

School; Mr. K. Stuart, B.A., Northgate School; Mr. Lawrence P. Andrews-Bligh; Mr. Ashton, Higher Elementary School; Miss Kennett, Head Mistress of the High School; Mr. Pridden; and others. The chief feature of the meeting was a paper on "The Teaching of Modern Languages," read by Miss Bentinck-Smith, M.A., Director of Studies and Lecturer in Mediæval and Modern Languages at Girton College, Cambridge. At the outset, she expressed disinclination to appear as the champion of any special theory of teaching modern languages. The teacher must be an artist, and not a mere copyist. Uniformity of method is as undesirable in teaching as in dress or religion, which is not equivalent to asserting that it neither matters how you teach nor how you dress nor what you believe. The ideal to be attained was that a modern language pupil should be provided with a sufficient knowledge of the language he had taken up, that when he left school he could read it well enough to keep up his interest in it. We did not know a foreign language properly unless we could express our thoughts in it. If it was impossible to get pupils to be perfect in the expression of their own ideas in a foreign language, one should aim at increasing their capacity to appreciate the thoughts of others; or, to put it plainly, turn them out more proficient readers. The best method of teaching was the conversational, or oral one, so that the child should learn to speak phonetically, before learning either to read or write ordinary script. Oral teaching was a *sine qua non* of all modern language teaching. As to the teacher, no one should be appointed unless he could speak the mother tongue of the country he was in; in other words, in English schools modern languages should be taught by English tutors who have gone through a University training. In reference to the custom of announcing set books for examinations, Miss Bentinck-Smith considered them to be the bane of all true literary training or culture. Set books were in the main a test of memory, and memory was not the faculty that required the most development in the child. Teachers of modern languages must go abroad from time to time to refresh their studies, and in order to accomplish this, higher salaries should be paid to them. Apart from foreign languages, what did the child know about his own tongue? It was the parent's duty to cultivate the children's taste for a love of good books, so that as they grew up they would avoid the trash which was so generally read. In summing up her remarks, the speaker said that, in her opinion, the teaching of French, German, and English should run on parallel lines. In each language, the best method of obtaining the child's interest, and of so getting it to learn, was the conversational method. A number of those present took part in a discussion on the paper which had been read, and Miss Bentinck-Smith replied, criticizing their remarks. Mr. T. E. Cattell proposed a vote of thanks to Miss Bentinck-Smith, which was seconded and duly carried. The company were subsequently entertained to tea.

Salop.—A delightful evening was spent by the members of the Salop Branch at the Girls' High School on Friday, February 10, when Mr. J. L. Paton (High Master of Manchester Grammar School), who was modestly announced to read a paper on "Boys' Hobbies," gave an illuminating and charming address covering a very wide range of thought and of great practical benefit to educationists. The Rev. Prebendary Moss presided, and included in the company were Mrs. Moss, Miss Wise, the Rev. J. C. and Mrs. Street, the Rev. T. and Mrs. Townsend, the Rev. R. L. Franks, Dr. Calvert, Mr. T. E. Pickering (Hon. Secretary), &c. The Chairman said it was a peculiar pleasure to him to introduce his old pupil, Mr. Paton. He always associated Mr. Paton with the removal of the school—not that he exactly removed the school—but because he was head boy at the time the school was moved, and was present on that great occasion when the school was formally opened. At Cambridge Mr. Paton carried all before him: he was head of his year, was as near Senior Classic as was possible in these days, these evil days of reform, and since then his name had been conspicuous at Rugby and now in Manchester for the extraordinary success he had obtained with his boys. But, as Mr. Paton was touched with that modesty which was peculiarly natural to Salopians, he would say no more. Mr. Paton defined a hobby as, first, a thing we do by way of a change from our routine occupation, and, secondly, a thing we do with pleasure. Hobbies must be active—a passive thing may not be counted as a hobby. Smoking, for instance, is not a hobby: it is merely a survival of that childish instinct which makes us want to pull at something in our mouths. Dealing with some boys' hobbies, Mr. Paton had much praise to give to stamp collecting, and he especially commended it to aspirants to the teaching profession, because it involved an enormous deal of patience and perseverance. Secondly, it seemed to him that it made a demand on the powers of nice observation and discrimination, and at the same time—a necessary corollary—on the powers of classification. It also taught the boys geography and gave them knowledge about the exchange value of coins, and indirectly about history, both contemporary history and the history of the past. But there was another side: like so many of our amusements in England, unfortunately, it had become a business, and whenever a thing became a business, whether in betting or professionalism, true sport went out of the window. But what he really wanted to discuss was what ought to be the attitude of teachers towards hobbies—teachers and parents, because for purposes of education they two must work

together. Of course, work was work, and a hobby was a hobby; Nero was an example of a man who overdid his hobby at an inopportune time. Teachers themselves were not perfect: a certain class thought wisdom began with them and ended with them. They were rather apt to presume, especially now that they were trying to map things out, that boys did not know anything except what they were taught; there was a danger at the present time that the machinery of education might make such increasing demands upon the child that the machine might be more and more, and the boy and girl might be less and less. Class work was, of course, necessary, but, considering what the increase of subjects had been in the curriculum, considering how even from the nursery the child was subjected to continual examinations, realizing how frightfully systematic our games had become, he thought they would agree with him that there was a real danger that the spontaneous life of the child might be sacrificed to the machinery, that it might lose much of its individuality, that it might have so much of its time mapped out and determined for it that it might lose through sheer atrophy the power of mapping out its own time and determining the object of its efforts. The mind needed its play as well as the body, and the hobby was the play of the mind. He would urge that the hobby had its educational value. In regard thereto we thought that the teacher and the parent should stand behind the scenes, and neither prescribe nor proscribe, nor find fault if boys frequently changed their hobbies. Many parents did find fault—of course, teachers were too wise—if boys chopped and changed; but it was only natural on the part of the boy. He wished to find out what he liked best, and it was all useful experience. Therefore they should not blame a boy if he was fickle with his hobby; neither should they presume, if he took up photography very vehemently, that it was worth while buying him an expensive camera. Even if the hobby took time which otherwise would be devoted to lessons, it was worth it, because from the play of spontaneous activity the mind got a freshness and an edge which otherwise it would lack. After speaking of the value of collections of plants, butterflies, shells, beetles, &c., as a means of opening lads' eyes to Nature in a way nothing else can, and saying a special word in favour of pets, Mr. Paton went on to say that there was a vandalism in boys, and even in adults where he came from, which seemed to him to be the result of a certain *lacuna* in childhood. It was the inalienable right of every child to be bred on the farm. Our usual method by which we tried to make up for the natural birthright of the child was repression, preaching, and punishment. That vandalism seemed to him to be the result of flying in the face of Nature—as the Greeks would put it, "fighting against God." Our cities were negations of what a child should have as a playground of its early life. In that dirty-mindedness which pervaded every set of boys, to a certain extent, he found those boys most free from it who had been brought up on farms and had known in an open and natural way the processes of Nature. Other points the speaker impressed were that the child should do all the work in connexion with his hobbies, and that the use of a hobby to a boy was in inverse proportion to the amount of money his father had spent on it. The more it represented of Tommy's own work and the less of his father's cash, the more educational value it would have. It was a mistake to judge by actual, tangible, visible results: the results must be looked for in the boy himself. The question to be asked was: What good has he got from doing it? and, also: What harm has it kept him from doing? Of course, it was possible that the hobby might not give pleasure to other people. Spurgeon was once asked whether it was possible that a trombone player might also be a Christian. With the strong common sense which characterized him, the great Nonconformist divine replied that he was positive that a trombone player might also be a Christian, but he was not at all certain that it was possible for the man who lived next door to a trombone player to be a Christian. A hobby, like virtue, was its own reward; but very frequently it supplied, if not an answer, at any rate a clue to the answer, to that perplexing problem, What shall we do with our boys? Charles Darwin's real self was in the greenhouse and garden rather than in the Latin verses and Greek iambs they tried to grind into him in Shrewsbury School, and he had known many instances where the hobby had determined the future career of the man. That which most distinctly stamped a child's own separate personality was the use it made of its own leisure time, when it was its own master—in a word, its hobby. That distinctive personality was the salt which seasoned the whole of life and its activities. Individualism was the corruption which destroyed life, and individuality was the salt which preserved it.—Prebendary Moss made some comments on Mr. Paton's paper, and proposed a vote of thanks to him, and to Miss Wise for receiving the meeting. Mr. Thomson seconded the proposal, which was carried with enthusiasm.

Three Towns.—On December 2, 1904, Mr. Alonzo J. Rider presided at a meeting of the Three Towns Branch at the Athenæum, Plymouth, when Mr. G. P. Dymond, of the Hoe Grammar School, read a paper on "Sidelights on American Education." Mr. Dymond said a careful examination of current articles in the American press led one to the conviction that there were many earnest-minded observers on the other side of the Atlantic who were by no means satisfied that all was as well

as the average American would have them believe. The defects of the educational problem in America were (1) the excess of manual training in schools, which led to "that dilution of scholarship which comes from the effort to teach a great many subjects in a limited time"; (2) lack of thoroughness in education; (3) insufficient development of the intellectual powers. The instinct of the true educationist was apparent when he insisted that the best service which could be rendered by the schools of the people was to teach men to think; for right thinking lay at the base of all right progress. It was interesting, and somewhat surprising, to find that the curriculum which the head of an American institute of technology advocated as especially calculated to fit a lad for subsequent training in those manual arts in which the American was generally supposed to excel was precisely that which for some years past had been in vogue in English secondary schools. The question of thoroughness was greatly exercising the American mind. Constant complaints were made in the American papers that the children were taught all sorts of "frills," but could not write or spell. One writer said the American pupils left school ignorant of what every one ought to know, and incompetent for the things that every one had to do. Indignation meetings had been held in some places in the United States to protest against the laxity of teachers with regard to some of the elementary subjects. It was noted, on the authority of Mr. W. Fletcher (of the Mosely Commission), that when the age of eighteen was mentioned in America as regards the school life it practically meant sixteen according to the English standard. It was of supreme interest that this eminently practical nation was waking up to the necessity of prolonging a boy's education. America had realized more widely than ourselves that educational short-cuts were a failure. It was constantly stated that there was no religious question in America, but a shrewdly observant Englishman who for some years had been residing in the United States wrote: "The Americans themselves have not by any means solved the question of religious education. There is powerful control over some of the leading Universities. There is beginning a very vigorous agitation for the teaching of the Bible in the common schools, which will mean mischief in a country of such heterogeneous religion as this." The Mosely Commission's report was only a partial one on the existing state of the educational life of America. There were points on which America had much to learn from England. In England, therefore, they must be careful lest in their new-found zeal for rooting up the tares they rooted up the wheat also. At the same time, it would be arrant folly to remain blind to some of the excellences of the American system. Mr. Coward had summarized what we may learn from America, emphasizing the following points:—(1) That the utmost should be done in the way of equipment and efficiency for the elementary schools; (2) that secondary schools be thoroughly organized, new schools established where necessary, and existing ones improved and controlled as much as possible; (3) that the passage from the primary to the secondary school be made as easy as possible; (4) improve evening and technical schools; (5) unite teachers of all kinds into one great profession, and train them well; (6) extend the usefulness of existing Universities and University colleges and provide new ones; (7) encourage inquiry and experiment, and secure the co-operation of other authorities with the school authorities. Mr. A. Edmund Spender, as a member of the Mosely Commission, hoped it would not be forgotten that the report did not pretend to deal in the fullest degree with the question of education. It could not be expected that the report would be absolutely perfect; the time at the disposal of the Commission was limited. He devoted the whole of his time to reformatory work and truant schools, but he did not go there to criticize, but to find out what was best. It was a question whether the time had not come for this country to turn its attention more to the training of our lads, especially in preparation for their professions in life. Competition in commerce between nations was becoming keener every day. Many of our boys did not receive the education that they should have, and it was not given through the right channel. Training up boys with the ideal of business was training them instinctively to look ahead to the days of manhood. He regretted that there were to be found a large number of boys who appeared to have no intention in life; who appeared to be drifting into the condition of supposing that it would be all right by-and-by. That was not the right path, especially when they realized the great commercial competition going on between nations. He also regretted to see that in Plymouth and other places the night schools were not so properly appreciated as they should be. That was made a very important point in America, where they would find that when the boys and girls left work they made their way to the night schools to learn something. One of the weaknesses in the educational system in America was the absence of any definite criterion or definite status. Each State worked independently; each had its own line or idea as regards education. There was no central point; but the Americans were now giving attention to this. He felt extremely glad that Mr. Quiller Couch had in an indefinite way suggested the necessity for a University in Cornwall. It might be wise if such a class of University, not altogether on too large or too expensive a scale, was started in various parts of England, where the youths could finish their education.

At the same time, such Universities should be under some central control—perhaps in London. One of the weaknesses in America was the inequality of the teachers, entirely due to the fact that they were so inadequately paid, and there was no scope given to them. He did not suppose teachers took up the profession with the idea of becoming millionaires, but it was not quite fair that they should be inadequately paid. Was it wise to spend extravagant sums upon the picturesque and the ornamental in the buildings, the material, and then very inadequately to pay the brain? Americans were also turning their attention to that matter, and he thought that within the next ten years they would have brought about a remedy to some extent.—An interesting discussion followed, in which the Rev. J. M. Hodge, Mr. G. Michell, Mr. T. P. Treglohan, and the Chairman took part.—Mr. Dymond was heartily thanked for his paper.

IN OLD TOURAINE.

(REMINISCENT OF THE TEACHERS' GUILD FRENCH COURSE AT TOURS.)

ERSTWHILE, my castles have been built in Spain,
The airy visions of my brain ;

But I have been to France, and there
Have found *châteaux* as rich and rare
In Old Touraine.

No fancy-fashioned fabrics of a dream,
But time-defying, so they seem,
These regal relics of Old France,
The scenes of love and death and dance,
And swords a-gleam.

When the rude rule of force began to wane
Learning reborn, in Francis' train,
War's spoil, from Italy was brought,
And ever grew while still she taught
In Old Touraine.

Azay-le-Rideau, Amboise, Blois, Langeais,
Chaumont, Chenonceaux mark the way
She followed through the fertile land ;
Her monuments on ev'ry hand
We see to-day.

Here kings are courtiers, and, loving, deign
To stoop to conquer, nor in vain ;
For gallantry is virtue when
Women in morals match the men
In Old Touraine.

Here meet the middle and the modern age,
On history's brightly painted page,
Where women rule and love holds sway,
Death hath no terrors, life is gay,
And passions rage.

Here, still unwarned of all her later pain,
Bright Marie Stuart lives again
For us ; a child with woman's wit,
Learning to make the most of it
In Old Touraine.

Cold, crafty, cruel Catherine is there ;
Diana, calculating, fair ;
Agnes, more loving, not less frail,
And Joan, as pure as is the Grail,
Teach kings to dare.

Here Guise, the scarred, the man of force and brain,
The giddy summit strove to gain,
Till the throne tottered at his breath ;
So he was basely done to death
In Old Touraine.

And thus the pageant strides before our eyes,
Great figures, garbed in diverse guise,
The cunning, martial, callous, fair,
The cowering crowd, the few that dare,
The fools, the wise.

As background for these dead who live again,
From moated keep to tapering vane,
Stand the grey walls in strength and grace,
Stone-written stories of the race,
In Old Touraine.

F. J. M.

Horace Marshall & Son.

The Modern School Publications issued by Messrs. Horace Marshall & Son include a number of the Books recommended by the Board of Education for a Four Years' Course in English.

Full List and all particulars, with Horace Marshall & Son's Complete Illustrated Catalogue, sent post free on application.

Hakluyt's English Voyages. (Selections.)

Edited by E. E. SPEIGHT, B.A., F.R.G.S. With an Introduction by Sir CLEMENTS MARKHAM. Cloth, crown 8vo, Picture Cover, fully Illustrated, 2s. 6d. [Now ready.]

Prescott's Histories of Peru and Mexico. (Selections.)

Edited by S. LAMPREY, B.A. In Two Parts. Cloth, crown 8vo, fully Illustrated. Peru, 1s. 3d. ; Mexico, 1s. 3d. [Ready immediate'y.]

A Book of Ballads.

Edited by C. L. THOMSON. Cloth, crown 8vo, 1s. 6d.

Stories from the Northern Sagas.

Edited by E. E. SPEIGHT, B.A., and ALBANY F. MAJOR. Cloth, crown 8vo, Illustrated, 1s. 6d.

Selections from the Morte d'Arthur.

Arranged by C. L. THOMSON. Second Edition. Cloth, crown 8vo, Illustrated, 2s.

Spenser's Faerie Queene, Tales from.

Edited by C. L. THOMSON. Cloth, crown 8vo, Illustrated, 2s. 6d.

THE CARMELITE CLASSICS.

Lays of Ancient Rome. Edited by N. L. FRAZER, B.A., of the Whitgift School, Croydon. Price 6d.

Milton: L'Allegro and Il Penseroso. Edited by C. L. THOMSON. Price 4d.

Milton: Comus. Edited by C. T. ONIONS, M.A. Price 6d.

Milton: Lycidas and the Sonnets. Edited by N. L. FRAZER, B.A. Price 4d.

Milton: Samson Agonistes. Edited by C. T. ONIONS, M.A.

Goldsmith: The Deserted Village. Edited by C. T. ONIONS. Price 4d.

Goldsmith: The Traveller. Edited by N. L. FRAZER, B.A. Price 6d.

Coleridge: The Ancient Mariner. Edited by N. L. FRAZER, B.A. Price 4d.

This New Series of "Carmelite Classics" aims at providing Standard English Texts at a low price, of attractive appearance, and containing a minimum of editorial matter. Such notes as occur refer only to such matters as pupils of school age could not be expected to know or to think out for themselves, and when quotations from Greek or Latin authors occur, they are given from Standard English translations.

SPECIAL NOTE.

The following books are now ready :—

The New Temple Reader. 1s. 6d. net.

The Preparatory Temple Reader. 1s. 6d.

The Temple Infant Readers. 4d., 4d., and 6d.

Ancient History. By W. H. SALTER, B.A. 2s. 6d.

Send for Complete Catalogue.

OCCASIONAL NOTES.

DURING the last month the Registration Council has been in a state of suspended animation, but by a Minute in Council it is now resuscitated for another year, to date from March 6. The Board of Education models itself on the policy of the Government, and lives from hand to mouth. We must wait yet another month or more for the report of the Registration Council for 1904, of which, we are informed, the Board has not yet seen fit to sanction the publication. Meanwhile we can only repeat our former criticism, that we are no nearer the establishment of a Register of Teachers, "in which the name of every registered teacher shall be set forth in alphabetical order," and which "shall be published annually," "by virtue of Section 4 of the Board of Education Act, 1899," than we were in 1902. We may further point out that, unless the Board face the situation, and set to work at once to provide a new scheme, the Register in a given time will assuredly collapse of itself, and perish of inanition. In March, 1906, the temporary conditions of registration cease to be operative, and under the permanent conditions only 150 women and 4 men have hitherto been registered. Sir John Gorst told the House that the Register was intended to be, and would be, self-supporting; but, even if the number of teachers who can satisfy the permanent requirements were quadrupled (and the provision of training for secondary masters is almost at a standstill), it is clear that an income of £200 a year will not cover office expenses, to say nothing of publication. Column A is a cardboard figment; Supplemental Registers are postponed *sine die*; and, unless something is done, and that quickly, Column B will likewise end in a *fiasco*.

THE resignation of Dr. Warre has let loose a flood of coffee-house babble in the *National Review* and the daily press, with which we need not concern ourselves.

Eton.

We cannot, however, dismiss it with the cheery optimism of the *Spectator* (Mar. 11).

That there is a difficulty in finding a successor to Dr. Warre does not prove that Dr. Warre was an ideal head master. To say that "in the matter of sanitation Eton is not worse than other great schools" is not tantamount to giving it a clean bill of health. It ought to be better. "The ventilation of a schoolroom is a small thing compared with the atmosphere of a school." True, but Eton's most loyal sons do not bear out the assumption that the "atmosphere" of the school leaves nothing to be desired. "It must be frankly admitted that the intellectual standard maintained at the English public schools is low; and, what is more serious, I do not see any evidence that it is tending to become higher. . . . We send out from our public schools year after year many boys who hate knowledge, and think books dreary; who are perfectly self-satisfied and entirely ignorant. What is worse, not ignorant in a wholesome and humble manner, but arrogantly and contemptuously ignorant—not only satisfied to be so, but thinking it ridiculous and almost unmanly that a young man should be anything else." Such is the judgment of a singularly sane, and at the same time sympathetic, critic who was for eighteen years an Eton master. Dr. Warre has worthily carried on the traditions of Eton, but we hope that his successor will not be content "stare super antiquas vias."

THE enforced resignation of Mr. A. T. Pollard at an age which for a head master would be considered the prime of life is an event which calls for comment not only on account of the withdrawal of a distinguished member from the profession, but as raising in a concrete form vexed questions of tenure and school administration. The facts of the case are simple and, though variously interpreted, undisputed. The Governors of the City of London School are the Court of Common Council, who appoint not only the Head Master, but the assistants. As a consequence of this arrangement there has, of recent years, been considerable friction between the Head Master and certain members of his staff, and the whole matter was referred to a Special Inquiry Committee. The Committee recommended that Mr. Pollard be offered a retiring pension of £500 a year, but the terms of the report were such that Mr. Pollard felt compelled to decline the settlement. At a meeting of the Court of Common Council Mr. Pollard was heard. He convinced the Court of the justice of his objection, and the Town Clerk was instructed to draft a letter stating that the adoption of the report conveyed no reflection upon Mr. Pollard's scholastic attainments or his administrative capacities. It should be added that a letter, signed by twenty-seven out of thirty-one of the staff, was addressed to Mr. Pollard stating that, as far as the signatories were concerned, their relations to the Head Master had been "of a most friendly and harmonious character."

ON the personal side there is nothing to add except to congratulate Mr. Pollard on a successful vindication of his professional character and to wish him equal success in another place. The moral to be drawn from the case seems to us no less plain. While protesting against the irresponsible autocracy which English head masters generally enjoy, especially in the matter of dismissal of assistants, we have still maintained that the appointment should, at least in the

first instance, rest wholly in their hands. Whether these appointments should be only temporary, for a period of one or two years, the subsequent permanent appointment resting with the governing body, as we have recommended, or, as was recommended in the joint resolution of the Head Masters and Assistants, the head master should be empowered to act as agent of the governing body while the assistant holds office from and under the governing body, is comparatively a matter of indifference. The more thorny question of dismissal of assistants does not here arise; but, as suggesting the desirability of a right of appeal in the case of dismissed head masters, Mr. Thomas Allen will doubtless make a note.

ON the matter of fees in secondary schools the Board of Education have been compelled to climb down. This may perhaps be taken to mean that Mr. Morant, with the Local Authorities at his back, has been able to convince Sir William Anson that the previous attitude of the Board was impossible. We are now informed that

**Fees
in Secondary
Schools.**

the case of each school will be judged on its own merits, in accordance with local circumstances. The minimum fee of £3 and the maximum proportion of 25 per cent. free places will not be rigidly insisted upon, when such insistence would prove a hardship in the locality. We do feel that a danger exists lest secondary education should be so cheapened that it may lose some of its best and most distinctive qualities. We have advocated a fee of £6 as a minimum, and have expressed the belief that the needs of the locality for cheaper education could be met by the establishment of sufficient scholarships. This position is, we believe, unassailable with regard to schools that have been generally known as secondary. There remains a distinct difficulty, however, in respect to the class of school in large towns formerly known as higher-grade. These schools, partly to secure the higher grant, prefer to become secondary rather than higher elementary. The conditions are such that either they must consist of free places entirely or they must have a very low fee, lower even than £3.

THE Local Authorities are jubilant that they have again defeated the Board; and indeed it does not seem that the Central Authority has any legal power under the Act to interfere in the question of school fees.

Safeguards.

The Local Authority provides the school, and is bound to meet the deficit. It is, therefore, to the interest of the Authority to charge parents as high a fee as local circumstances make possible. Whatever the parents pay is so much saved to the ratepayer. But, admitted that the Board had, in fixing a minimum fee, overstepped their powers, it does not follow that the Board are unable to enforce a high standard of secondary education. The Board can withhold grants from such schools as do not come up to the standard fixed. If a school, as a result of low fees, is managed in an unsatisfactory way; if the staff is badly paid, and consequently inefficient; if the children do not stay long enough to profit by the school course, or if they are intellectually unfit on admission, the Board have their remedy. They can insist that secondary education means a definite course of study pursued until the age of sixteen at the lowest. This education ought to be open to every child whose parents can pay the fees, or whose intellectual promise is such that it would pay the country to educate that child as a national investment.

THE Inter-Departmental Committee appointed by Lord Londonderry to report on underfed school-children cannot be regarded otherwise than as an evasion of the

**Underfed Children
and Whitehall.**

question by a "not very brave Government." The facts were sufficiently elicited by the Physical Deterioration Commission, and, well qualified as are the members of the new Committee, which includes Mr. Cyril Jackson and Miss Maude Lawrence, they can add little fresh information to the Report of the Commission, though they may arrive at different conclusions. The Commission, it will be remembered, recommended a regular medical inspection of all schools and provision of meals at the public cost to underfed children under certain guarded conditions. We can see no possible reason why the first of these recommendations should not have been at once carried out by the Board of Education. As to free meals, there is no need to repeat the views we have recently expressed. It seems to us that the limitation introduced in the terms of reference, "without any charge upon the public funds," will render the inquiry wholly nugatory. Sir John Gorst's position is impregnable. The first duty of the State is to see that no children are starved, and to force learning down the throats of starving children is to offer stones for bread. The second duty is to bring home to parents the responsibility for their children. Sir John Gorst believes that he has solved the equation, and found the way both to feed the children and to make the parents pay. Sir William Anson has an open mind—that is, according to Mr. Chamberlain, an empty mind—and he waits for the Whitehall staff to give him ideas. Not a very brave Government!

THE scheme for School Certificates issued by the Cambridge Local Examinations Syndicate is quite in accordance with the proposals of the Consultative Committee, and we welcome it as an anticipation of a national scheme, and one that can easily be dovetailed with such a scheme when it is formed. The new departure is that Certificates will be granted only to pupils in approved schools. To be approved a school must either have been inspected by the Syndicate or recognized by the Board of Education. The schedule of examination subjects is well considered, and holds the balance fairly between the humanities and science. Both Junior and Senior candidates are required to pass in arithmetic, English language and literature, and one foreign language. In the alternative subjects, language seems to us to have hardly its fair share. The science boy may pass on religious knowledge only, in addition to his science, but the classical boy will be compelled to take one section of higher mathematics or of science, and, if he takes French, his Latin and Greek will not count. We think that for the Senior Certificate two languages might be demanded.

THE Board of Education has recently been subjected to criticism of all kinds, much of it just and much of it arbitrary and captious. We should like to submit a protest against the delays in the publication of returns and in the payment of grants. The whisky-money return for the year ending March 31, 1903, was published in January, 1905, and the list of grants to secondary schools for the year 1902-3 is still unpublished. New regulations for pupil-teachers and secondary schools were published in July last, a few weeks before they came into operation. Forms, such as those for local scholarships, were still at the printers' a few weeks before the date for their return duly filled up. A few weeks ago Mr. Soares asked whether Sir William Anson was aware of the inconvenience to Local Authorities caused by the delay in the payment of annual and fee grants, the payments being several months

**Delays
at the Board.**

overdue. The Parliamentary Secretary pleaded "special pressure"—an excuse which, it may be hoped, will not be heard again. Lastly it may be noted that the names of the new Inspectors for Secondary Schools, who take office on April 1, have not yet been published.

WHILE we are constantly animadverting on the multiplicity of examinations, and suggesting the suppression of some and the amalgamation of others, it may seem strange to hear that yet another examination board has been formed. Yet we cannot refuse a welcome to it, as it deals with a side of work that has been neglected in the past. The Board in question proposes to give certificates of efficiency to those who want to teach hand and eye work in schools. The aim is therefore distinct from the aims of the City and Guilds Institute, whose manual examinations are directed towards the encouragement of a scientific attitude on the part of skilled artisans rather than teachers. So far from objecting, we regret that the Board of Education have not seen their way to absorb this new body. They have, however, "recognized" the examination, and appointed two of their inspectors to seats upon the Council—Mr. Legard and Mr. Marvin. Mr. Dyke Acland is President, and many other influential persons are associated in the work. Particulars can be had from the Hon. Secretary, Mr. John Cooke, at 4 Bloomsbury Square.

SOME of our contemporaries shake their heads over the insufficiency of the London County Council, with its comparatively limited membership, to deal adequately with the mass of educational business that comes before it. These argue that the control of the schools will fall more and more into the hands of permanent officials. We admit the likelihood, and indeed the inevitability, of this result; but we do not admit that any disastrous consequences are bound to follow. On the contrary, we would ask if any but trained experts are capable of visiting schools and bringing away useful information. The Board of Education consists almost entirely of permanent officials. For the action of these Sir William Anson is responsible to Parliament. In the same way the members of the London Education Committee are responsible to the Council—a body that is proportionately less occupied than the House of Commons. Mr. John Burns is uneasy at the increase of the London inspectorate, and perhaps he fancies he has checked the forward policy of Mr. Sidney Webb in this direction. But, if the members of the Council are no clearer than the reporters of those papers which aim at correct accounts of the proceedings, they may be unaware of what is happening. An advertisement that still continues to appear states that four divisional inspectors will be appointed at salaries of £600, rising to £800. According to the newspapers, this proposal was defeated.

IN London the county rate for general purposes is to be 1s. 5d. in the £ for the coming year; for education it is to be 1s. 6d. Of course, this announcement has created some alarm. Wild and exaggerated criticisms are made upon the Council's extravagance. It is natural enough; and yet it is quite obvious to any observer that a further increase is inevitable. Putting aside the expenditure on secondary schools, which must mean a large and growing annual cost above and beyond Imperial grants, and neglecting the additional sums required for the training of teachers, in spite of the increased liberality of the Treasury, there must before long be a reorganization of primary education which will almost double its cost. One of Prof. Sadler's five

points which he made the other day at Liverpool is this: smaller classes and more individual attention in the elementary schools. We all admit the need, and we must be prepared to face the cost. Children in the elementary schools have another claim which will eventually have to be met: they need play-grounds. The playing fields of Eton are, of course, a dream that cannot be realized by poorer schools; but the need for suitable physical training is as acute in the elementary schools of large towns as it is anywhere. The need will have to be met, and its provision means money. The ratepayer must be still further bled; the first thing to be done is to convince him that such expenditure is an investment that will bring in a good return.

LORD LONDONDERRY does not claim to be an expert in the teaching of art, and his remarks at Leeds, where he opened a loan exhibition of pupils' work from the Geneva School of Industrial Arts, were carefully non-committal. But Whitehall can learn a lesson from Geneva no less than the Local Authorities in England. Some time ago the West Riding Education Committee sent its art masters to study the Geneva system, and the report of their impressions has been widely circulated. This visit has been followed up by the exhibition that Lord Londonderry opened. Curiosity may be expressed as to whether the auditor will pass the expenditure or whether the ratepayer will leave it uncriticized. But perhaps the cost has been met by subscriptions from members of the Committee. In any case, the exhibition and the events that led up to it will do much good. The especial lesson, it seems, to be learnt from Geneva is the need and the possibility of co-ordinating the teaching of art from the beginnings in the kindergartens to the finished work in the schools of industrial design. Now that education is under one authority it is possible in England to plan a properly graded course of instruction in art. This means the appointment of an art inspector for each district who will have authority over the various grades of schools in the locality.

ASSISTANT masters may congratulate themselves upon the friendly reception by the Sheffield Education Committee of a deputation from the West Riding Branch of the Assistant Masters' Association. The object of the deputation was to show that the interests of secondary education demanded greater security of tenure, increased salaries, and the provision of retiring pensions. On the first point, Colonel Hughes, chairman of the Higher Education Sub-Committee, explained that, after a long struggle with the Board of Education, they had secured that the head master should sit upon the governing body, and that therefore in every case of dismissal he would have to lay the full facts and the grounds of dismissal before the governing body. With regard to salaries, Colonel Hughes interrupted the deputation to remind them that they were speaking to men already converted, and that in Sheffield they had adopted a scale of salaries which was practically the one that the deputation was advocating, *i.e.*, £150, rising to £300 by regular and automatic increases. When a rise of salary was due, the head master would be asked orally at the governors' meeting if he approved, and upon an affirmative reply the rise would be granted. It is clear that, if he dissented, the Governors would ask for reasons, and would consider the case. On the matter of a pension fund, Colonel Hughes was quite right in saying that a single Authority could not form a scheme that would be financially sound. He advised the deputation to continue to hammer at the doors of the Board of Education.

A LIST of influential names is appended to a petition praying the London County Council to extend the system of vacation schools, and to make a grant to cover the cost. The Council will certainly lend a willing ear to the proposals; but it is not probable that it will make a payment that

**Vacation
Schools.**

will cover the major part of the cost. Until public opinion has considerably advanced and brought about new education Acts with enlarged scope, the organization of these schools, as it seems to us, must remain largely in private hands and their support be looked upon as a legitimate object of philanthropy. It is certainly true that our feeling of responsibility towards those less fortunate than ourselves is steadily growing. We give book-learning free; we are on the way to the provision of food for the necessitous; and the public conscience is being roused on the subject of seeing after the leisure time of the children as well as their hours in school. To give the power of finding reasonable occupation for leisure hours is by no means the least important object that education has to aim at. The testimony of the police is to hand to witness to the disastrous effects of the idleness of children in the streets of London during the summer holidays. The vacation schools have already done much good: there must be more of them.

TO find the teachers for these vacation schools is one of the chief difficulties. Although the actual school hours of a teacher in a public elementary school work out

**How to staff
them.**

at an average of about three hours a day, taking the whole year and including Sundays, yet no wise person will suggest an addition to the burden the teacher in a town school already has to bear. A certain proportion of expert teachers there must be; but these can have as their lieutenants a number of "persons of leisure" who will do the work with enthusiasm and without money reward. It would not even be wise for teachers in secondary schools, although they have longer holidays, to give up part of August to what must be exhausting work. At present these schools are admittedly experimental. They mark a stage, and a very important stage, in the growth of the feeling of responsibility on the part of the nation as a whole to each individual. Two advantages will accrue: the success of the vacation schools will go far to convince us that our present curriculum is too bookish; and, secondly, we shall realize that, in large towns, at any rate, there must be continuous school all through the summer, and the children and the teachers must take their holidays in relays during the months of June, July, and August.

IF London is getting uneasy at an education rate of 1s. 6d. in the £, what must be the feelings of the inhabitants of the Borough of West Ham, who are now threatened with

**Unfair Incidence
of Local Rates.**

a rate of 2s. 10d.? It is, perhaps, hardly necessary to point out that this enormous rate is not the result of any special extravagance. It arises from the conditions of the locality, in which the proportion of children per thousand of population attending public elementary schools is, we believe, higher than in any other borough. The idea of supporting education out of rates is based on the ground that it is an advantage for the whole population that the children of the working classes should be educated at the cost of the country. It is clearly, therefore, unfair to lay upon any area consisting mainly of the classes that use these schools the duty of supporting them. In saying this, we do not forget that a large proportion of the cost is borne by the taxpayer. But when it is remembered that in counties a sixpenny rate, and in boroughs a shilling, will, roughly speaking, cover the rate-

payers' share, it is obviously hard that districts should be so divided that the rate falls so unevenly as it does in West Ham. The boroughs with a rate over one shilling are organizing a deputation to the Prime Minister on this subject. There is a choice of two remedies: either larger rateable areas or else a greater proportion of the expense to be borne by the taxpayer. One of these two reforms must be introduced before long.

WHILE we do not consider it feasible that the fees in public secondary schools should be raised to a sum that would pay the cost of education, for the purpose of

**Private Schools
and Scholarships.**

preventing competition with private schools—such a policy seems to sweep away the need for all Government grants and secondary education rates—yet we do feel that private schools have an undoubted grievance on the matter of the eligibility of their pupils for County scholarships. These scholarships are given out of public money on the ground that it is a good investment for the nation to provide further opportunities of education to children who will thereby become more useful to the State and who otherwise would be unable to enjoy this education. There is then no logical ground for limiting the choice of candidates for these scholarships. Whether the candidates have been educated in this school or that is a matter of absolutely no importance. The test to which they are put decides whether they show sufficient promise to justify the expenditure of public money upon them. That is all. Of course, an income qualification may be introduced; that is another matter, and does not affect the present argument that no class of children ought to be excluded from participating in scholarships provided by public funds, merely on the ground that they have been educated in a private school.

IN an able paper read to the Rochdale Educational Society, and since published, Mr. T. C. Horsfall gives a lucid account of the German school system as regards

**Mr. Horsfall
on Denominational
Schools.**

religious instruction, and states the conclusions reached by the foremost German educationists, and in particular by Dr. Rein. These are, in brief, that religion must form an integral part of the curriculum, not an extra subject to be relegated to denominational ministers, and that the *Simultanschule*, a school in which two or more creeds are taught side by side, is a house divided against itself, which cannot stand. We can only take notice here of Mr. Horsfall's application of these principles to England. He would have, wherever needed, three kinds of denominational schools, Jewish, Roman Catholic, and Protestant, with teachers of the respective denominations. So far most would agree, but what of Protestant dissenters? "Here and there it might be necessary to have a school with Church of England teachers for the children of Church of England parents, but, if the decision rested with the parents of children, and not with the clergy, I do not believe that a score of such schools would be needed." Again we agree, but we should be curious to know what the Vicar of Rochdale said to this scheme. If a Liberal Broad Churchman like Archdeacon Wilson dissents, what hope is there of winning over the Bishops and clerically minded laymen?

THE new scheme for the mutual recognition of Oxford, Cambridge, and London certificates is now in full working order. The examinations concerned are the Oxford

**Mutual
Exemptions.**

Senior Local, the Higher Certificate of the Joint Board, the Previous at Cambridge, the Cambridge Senior, and Responsions at Oxford. Roughly, the various subjects at these examina-

tions are regarded as equivalent; except that to secure exemption at Responsions the London Matriculant must have taken or must take an extra paper at the London Matriculation in Latin Prose. This paper is not part of the examination proper, but no extra fee is charged in connexion with it. The three Universities—and secondary schools also—must be congratulated on this satisfactory agreement. The evil of the multiplicity of examinations is thus considerably mitigated by a scheme more simple and practical than that of the Consultative Committee.

BY a stroke of the pen, or, to be more exact, by a short resolution, the London County Council has practically settled the tenure question in London secondary schools, excluding only a few of the older schools, such as Westminster and Dulwich. The governors of schools receiving grants from the Council are to be informed

**Tenure
in London.**

that it is the wish of the Council that they shall exercise control and responsibility in the appointment, dismissal, and payment of all teachers employed in their schools, and that they be asked, if their schemes prohibit such control and responsibility, to apply to the Board of Education for such modification in the schemes as will give them the power to sanction the appointment, dismissal, and payment of all persons employed in their schools.

An amendment, by Mr. J. T. Taylor, to move back the recommendation was defeated. The Board of Education has not yet replied to the joint deputation of Head and Assistant Masters on this question. Perhaps the receipt of a few scores of schemes for amendment will stimulate them to activity.

LOCAL AUTHORITIES.

MR. BEASLEY, at the annual meeting of the P.S.A.I., gave some interesting information that he had collected as to the action of various Local Authorities in relation to private schools. West Ham has resolved that a register shall be kept of non-Council secondary schools in the area. All such schools may be inspected at the expense of the Council, and, if pronounced efficient, shall be open for the tenure of County Borough scholarships. Middlesex and Devonshire will pay half the expense of a Board of Education inspection. Kent and Oswestry will throw open their public buildings for the instruction of private pupils in certain subjects. Lancashire offers all the advantages recommended by the Bryce Commission to all recognized schools. Bedfordshire will make grants in the same way and on the same conditions to all schools, whether public or conducted for private profit. Staffordshire, Worcestershire, and several other counties allow their scholarships to be held in private schools. Plymouth allows a large choice among inspecting bodies to schools seeking recognition.

THE Bucks Higher Education Sub-Committee have been leisurely in the publication of their report for the year 1903-4; the information given only reaches the end of July last, and no doubt further progress has been made since then in the organization of secondary schools. The county is not well supplied in this respect. With regard to endowments for secondary education the county is especially poor. The endowments included in the Roby return work out at a little over £8 per thousand of population; but these figures take in endowments for elementary education. From inquiries made by the secretary, Mr. C. G. Watkins, it appears that the actual sum available for secondary education amounts to about £4. 10s. per thousand of population. But, if the sum is compared to the number of pupils in the Bucks secondary schools, it does not seem so small. There are only 400 boys and girls attending the public secondary schools in the county out of a population of about 200,000. This shows an endowment of over £2 per pupil.

**Secondary
Education in
Bucks.
Endowments.**

It is only since the year 1900 that the Education Authority has begun to support the secondary schools, and there is a lot of leeway to make up. According to the calculations of experts, there should be 4,000 pupils instead of 400 in the secondary schools of the county. Including two schools recently instituted by the Authority, there are now seven: five

New Schools.

for boys, one for girls, and one mixed school. This gives an average of just over fifty pupils per school—an uneconomic number. With improved equipment and enlarged building these numbers will greatly increase. From accumulated funds in the hands of the Authority a sum of £12,000 has been granted to be shared among the six new schools contemplated. In addition, a loan of £11,500 is to be raised. With the exception of the girls' school at High Wycombe, the other new schools are to be "mixed." This is, no doubt, the best way to deal with thinly populated areas. The new schools are at Amersham, Aylesbury, Buckingham, Slough, and Wolverton. It is, of course, obvious that some children in the county are educated at efficient private schools, while many are attracted to public schools in neighbouring counties; and that, therefore, secondary education is not quite so lacking as the official report would imply. These facts Mr. Watkins recognizes; but there is work for the Authority to do in order to ensure that no child in Bucks shall lack a secondary education because there is no school within his or her reach.

At the request of the Education Committee of the County Councils' Association, Mr. Macan has prepared a memorandum on the relations between secondary schools under one Authority and scholars coming to them from the area of another Authority. The arguments are so sound that they will certainly convince the County Councillor; and if they do not convince the Board of Education it will be because South Kensington cannot rid herself of the old-time traditions of the Charity Commissioners. It has been stated, however, that the seat of authority has now been transferred to Whitehall, and perhaps Mr. Macan is pushing at an open door. The point in dispute is this. If an Authority subsidizes a school in its area out of money belonging to the ratepayers of that area, shall pupils from a neighbouring county attend that school on the same terms as the children of the ratepayers; South Kensington says, in effect, yes, if the school is an endowed school; for they will not allow preferential fees to be charged. If, therefore, the neighbouring county declines to make a *pro rata* grant, the Authority providing the school must share its grant with the pupils that come from over the border. This is obviously unfair. Either the neighbouring county or the parents should pay. In new schools the Authority can protect itself by means of preferential fees.

Benefits of Rates limited to Area rated.

THE Education Committee of Shropshire have issued a root-and-branch circular on the subject of physical training in elementary schools. The managers are recommended to terminate the engagements of the outside instructors of physical training. In future this instruction is to be given by the ordinary staff, and no member is to be excused unless he or she can prove some infirmity which makes physical drill impossible. The principle is a right one. The influence of the drill sergeant called in from the outside is of far less value than that exercised by a regular member of the staff. And it may perhaps be argued that in the case of young children the class teacher ought to be able to take the whole of the subjects on the time-table. On the other hand, there is obvious hardship in pressing a wise reform too far. The Circular states that all assistant and supplementary teachers will be required to attend classes unless they are already qualified to give instruction in physical training. Head teachers will have to do the same if they are reported as not efficient in this respect. It is to be hoped that a new generation of teachers will be brought up to look upon this work as an integral part of the curriculum; they and their scholars will be the better for it; but great consideration should be shown to a generation that has been trained with different ideals.

STUDYING MODERN LANGUAGES "PROPERLY."

DR. SWEET says somewhere (the chapter and verse are immaterial): "If modern languages are to be studied at all, they must be studied properly." When I read this illuminating sentence I groaned inwardly; for in that word "properly" I discerned the hitherto unattained ideal which I had been pursuing for so long in my French teaching, and it recalled to me also the conflicting counsels, the diverse systems which had been pressed upon me so pertinaciously. "Properly," forsooth! And who is to say what "properly" means amidst this babel? It used to be said that every French teacher wrote a grammar, and, if he did so, it was surely a harmless amusement. But to-day every French teacher is busy inventing a new system of learning the French language, and every school publisher (it is a class not without zeal), having acquired what he persuades himself to be the newest and best thing of the

kind, bombards the unfortunate schoolmaster with dictatorial pamphlets, specimen pages, and copies of all sorts, until the poor man's bewilderment is pathetic. It seems contrary to reason that there should be ten or twelve "best" ways of acquiring or imparting a language; but I speak without dogmatism; for each man praises his own plan with an air which appears to admit of no contradiction. Experience, however, must be the true guide, and my own experience, which is that of a teacher dealing with average boys and girls, may be of some interest to others.

Four or five years ago I was doing what at that period was still known as "teaching French"; that is to say, I was steadily drilling my pupils in the grammatical niceties of the French language, and laboriously preparing with them such books as "La Jeune Sibérienne," "La Canne de Jonc," or classics such as "Le Cid" or "Athalie." I should be the last to defend such a system. When my pupils left me they had the basis of a knowledge of *written* French, and that is all. I merely mention this stage in my progress to show the point from which I started in my pursuit of the ideal. One day I awoke to the fact that there was a revolution in the air, and that it was time to move. As one cannot move in five or six different directions at once, I had to choose, and my choice led me in the direction of an interesting family named "Chou"—a family of agriculturists, living, apparently, all together in a very small house, and engaging in ploughing, reaping, grape gathering in a manner not specially fertile in words or ideas suitable for English urban children. At all events, with these people did my classes and I live and move for certain tedious years. At first the children liked it, and so did I. But after a while doubt crept in as to whether this, after all, was really the ideal I was seeking. The sameness of the pictures, the tediousness of the pumped-up questions and answers upon indifferent or uninteresting matters, the strain of constant talking, the want of a definite grammatical basis, the lack of written exercises—all these things made me doubt. Such a plan, I concluded, gave a certain fluency within very narrow limits; but it provided a vocabulary quite inadequate for future stages and laid no solid foundation of grammar upon which future building might rest. *Exit* therefore the family "Chou"—carts, cattle, cocks, and hens.

My next experiment was in the direction of a method provided by a well known professor whose activity is remarkable, who has examined many of us, and from whom many of us have in one way or another learnt a great deal. His books are highly interesting and informing. They are full of jests, puns, riddles, songs, rimes, pictures, diagrams, and a hundred other baits for that very shy fish the interested attention of the average British boy. My pupils took very kindly to this novelty. They liked the pictures, they learned with little trouble the poems and songs which our professor provides, and on the repetition of which he insists so earnestly. And I am bound to say that, had they been likely to be examined upon anything of the kind in their future school career, the method might have been worth continuing. As it was, with "translation, grammar, and composition" examinations ahead, the defects were soon obvious: there was too little systematic grammar, the vocabulary gained was too small, and the lack of written exercises was an omission troublesome to the teacher and involving a painful want of accuracy in the pupils.

Fortunately, at this stage another reformer appeared—a true reformer of the reformers. "Reformers," said he, "who propose to teach modern languages by a purely imitative method will defeat their own object. . . It is impossible to impart a *correct* knowledge of conversational French without the careful and systematic study of grammar." This sounded like good doctrine, and I tried the book with some eagerness. Candour again compels me to say that the work is extremely interesting, with admirable pictures on almost every page, with matter excellently adapted to interest children, and with a most clear and sensible exposition of grammar. But, alas! there is always the *amari aliquid*; and what can be said by a teacher as to a "Primary French Course—First Year" which in its *first lesson* gives a reading lesson with over sixty French words, quite new of course to the scholar; a page of grammar containing the present indicative of *être*, the definite and indefinite articles, and the use of the accents; and a two-page "general exercise"? Macaulay's schoolboy might do this very well at one reading. An ordinary child, and it is the ordinary child we find in our class-rooms,

would take a fortnight or more to know it thoroughly. And this system is further complicated by the question of phonetics. Shall we or shall we not (for personally I have not had the courage to plunge my pupils into the added difficulties of phonetic spelling and transcription as a supposed means of making their general difficulties less) teach a phonetic alphabet and use a phonetic transcript; and shall we use such a transcript along with our ordinary spelling, or shall we use it by itself for a certain period, say three months, and then turn to the traditional forms? And, further, what system shall we adopt—the alphabet of the Association Phonétique, or some of the numerous modifications or adaptations of it?

No one can doubt the extreme value of a phonetic system and experience soon demonstrates its utility even with the merest beginners. At the same time, from *their* point of view, is it possible to avoid the idea that by giving a phonetic system we are giving them *two* new languages to grapple with instead of *one*? The small boy thinks of the learning of "ʒə sɥi syr yn ʒe:z" as an additional difficulty, and by no means as a help to the comprehension, of "Je suis sur une chaise."

But the methods already enumerated by no means exhaust the list. For example, there is a system widely advertised, and (one supposes) widely used, as to which, it is said, "constant speaking for each pupil of a class individually is combined with extreme fluency." This sounds attractive, but, on examination, the teacher learns with dismay that, the guiding principle of the method being constant revision, the pupils "*revise from the beginning at each lesson* until the amount of work becomes so great as to leave no time to go further ahead. When this stage is reached they devote *five minutes* to the new lesson, and the remainder to the revision." When one discovers also that what is to be revised in this manner consists of an intolerable deal of matter after this model: "Where is the gentleman?—He is in the garden. Where is the lady?—The lady is in the garden." &c., one is inclined to wonder whether pupils or teacher would be the first to succumb to mental and nervous exhaustion. And it is clear that, if learning a modern language means no more than this, then all talk about its educational value may be at once abandoned.

Another method which is (one need hardly say) described as being "according to the best and newest systems," consists of short phrases grouped under subjects, interspersed with recitations and songs, and proceeding to little conversations. The same has to be said of this as of a previously mentioned plan: with an energetic teacher it would give a certain fluency within narrow limits, but it would do but little to prepare for a solid knowledge of the language.

There is, further, another important point which is hotly debated, and as to which a French teacher is necessarily in grave doubt: Shall he teach French grammar through the medium of the English language or wholly in French? Thus we find Prof. Berthon, in a "Première Grammaire Française" recently issued, declaring that "new methods" require "new books," that there "is no grammar answering to the new needs," and that what is particularly wanted is "a grammar specially written for foreigners." And, further, he remarks that "grammar *learned and explained in French* is one of the most powerful helps that the oral method has at its disposal." Prof. Berthon's authority and his very excellent book would tend to make one adhere to his views, but immediately the voice of Mr. Siepmann is heard: "I am strongly of opinion that all explanations which break new ground should be given in the mother tongue. It is difficult enough to make pupils grasp points when they are given in their own language; if this is done in a foreign tongue, the result is hopeless confusion"; and, bearing upon this, I may quote the remark of a teacher who was extolling the advantages for his pupils of a grammar in French. "But," I asked, "do you not find that the difficulty of being sure that they understand the grammatical point is largely increased?"—"Oh!" said he, "I always translate it for them." Mr. Siepmann would have no difficulty, I daresay, in making the inference.

And, in addition to all these perplexities as to methods, there is also the perplexity caused by the existence, side by side, of the old and the new systems of examination. A French teacher (at any rate in Wales, and what Wales does to-day England will do to-morrow) has to make his pupils perfectly conversant with grammar, to ensure that they have a wide and modern vocabulary and that they can write decent French, either in "versions" or as "free compositions." All this is of the old school, and

the severity of the requirements has been in no degree relaxed. But, in addition, he has to see that his pupils read French "fluently and correctly," and that they write good *dictées*; and, still further, he has to prepare as many as possible for an individual oral test of "conversational power." If time had been proportionately increased, there would be nothing to say; but in most cases, owing to the pressure of subjects, the time has gradually diminished whilst the range of work demanded has steadily increased. To combine the two methods of examination, and to require the highest standard all round, is to cause real hardship.

I have thus tried to present a true picture of the perplexities which involve a teacher of French—or, indeed, of any modern language—at the present time. An old system utterly discredited; innumerable new systems at war equally with the old and with one another, and having as yet a lack of authority and general acceptance; a clash of argument even about fundamentals; examining bodies halting between two opinions, and neither boldly accepting the new system with all its consequences, nor holding firmly to the old; teachers working each after his own plan, having no clear guidance—such is the position, a position which renders any command to study modern languages "properly" a platitude or a conundrum.

A. J. PERMAN.

ON SOME CONTACT PHENOMENA.

A PAPER FOR TEACHERS AND INSPECTORS.

BUFFER States are proverbially prone to shocks and subject to vicissitudes, and the state of the inspector is somewhat analogous. He acts at a point where the propulsive energy of a progressive Department meets the variable resistance of an uncertain mass of undeveloped youthful material. At times the resistance is slight, and he is rushed on to higher standards and loftier ideals; anon it reaches its maximum, and he bears his share of the resulting stress, standards and ideals alike suffering from the shock.

So, too, the teacher has often to mark the advent of a fresh inspector with a sense of shock, natural enough to the thinking man. The work of a school is moving with a well defined and long standing acceleration when suddenly a new arrangement of forces is set up, perchance with kaleidoscopic rapidity, and the laws of dynamics fail not in their inevitable action.

Fortunately for all concerned, these contact phenomena of which we would speak are affected by influences which tend to make the personal equation a very strong one. No universal laws hold good; but at the same time it needs comparatively little thinking to recognize the fact that, were these phenomena more carefully studied, a more constant sympathy between teacher and inspector would result. This sympathy is growing, and growing rapidly. Time was when the inspector was, in too many schools, dreaded and feared. That, we honestly believe, is now at an end, though the understanding is not always perfect even yet.

The inspector, representing a Department whose aim it is to make national education as good as it can be made, naturally looks for and hopes for work and a state of progress just a little better than it can possibly be at the particular moment. The satisfied inspector, were he to exist, would take from the teacher what the poet Watson calls "the boon of infinite striving." How often do we not hear of the difficulty of "satisfying the Department"! In the best sense of the expression, we say: "Well that it is so!"

As in a more tender connexion, so in that between inspector and teacher: neither must look for perfection in the other. The wise teacher is he who can derive comfort from having honestly done his utmost; and the discreet inspector is he who is quick to discern that, while much is left undone, the effort has been whole hearted and not ill directed. The adjective used above is used advisedly, for surely no capacity can be more useful to the inspector than discernment, tempered by discretion. Were an automatic inspector on the "Cash Register" principle within the bounds of human invention much of the pleasure would depart from the teacher's life.

Readers of the charming "Memories, Grave and Gay," in which the late Chief Inspector for Scotland embodied so much of his experience, will thoroughly appreciate the truth of the statement.

Take the case of the scholarly man whom perhaps a lack of robust health has consigned to the charge of some tiny rural school, far from civilization and railway engines. How he enjoys the one day in the year whereon he holds converse with a man of scholarly bearing! Though the progress of his school is impeded by geographical and meteorological inconveniences, yet he knows that his visitor is endowed with that common sense which leads him not to expect figs from thistles. Inspection over, the twain adjourn to the schoolhouse, and over a wholesome lunch (which, by the way, has been for days an incubus to the lady of the house) talk flows freely and the Arcadian draws from his visitor some heart and energy for toil yet to come. Anon, the dogcart comes round, handshakes are exchanged, and H.M.I. departs, flower-laden mayhap, but well content that even in the wilds are hands that bear aloft the torch of learning.

The meeting is not always thus, alas! Let the inspector be of a different type, and all is changed. We have met the type of inspector who would make the contact in such a case one of decidedly inelastic impact. He has his standards of judgment, but they are rigid, and their rigidity is evident from the questions he sets—questions fair and just in many a well staffed city seminary, but clean outwith the ken of these unsophisticated denizens of the wilds. The writer remembers an inspector who was sadly shocked to find children in a very remote region ignorant of the whereabouts of the *tibia*, who yet had rapidly to change the subject when the pupils pressed him hard on some point of local ornithology.

These cases are happily rare, and fast growing more infrequent. The gap is being narrowed from both sides. Now it is the teacher who learns to discriminate between potentiality and performance, anon it is the examiner whose experience teaches him that Russell Lowell was right when he emphasized the distinction to be drawn between facts and truth. A child may be as full of facts as he will cram, and densely ignorant withal; another may have a scantily furnished brain, and yet possess the power of grip and the clearness of perception that are worth stores of isolated facts. Nor is it a case of "Ex uno disce omnes."

Every teacher must have met an inspector of the rapid type—the man who can, in one short day, see all that is to be seen in a school, who can, with the most accurate sense of touch, lay his penetrating finger on the weak spots which always exist. We have heard the witless manager hurl heedless anathemas at the head of such a man, charging him with the superficiality of seeming haste; yet reflection convinced us that there was in his haste more than a trace of "wanton heed and giddy cunning." He had done what nine teachers out of ten believe they are capable of doing, and what probably one of the nine really could accomplish.

The real inspector—who must be born; for he cannot well be made—is, fortunately, far from being a *rara avis*. In the contact with him is no faintest suspicion of shock. Though his ideals are high and his standard likewise, yet he carries with him an atmosphere that receives and absorbs the concussion inevitable in many cases. The exact composition of this surrounding medium is variable, but its constant elements are human kindness and width of vision. The former of these is visible in the instant sympathy yielded him by the children; the latter betrays itself in the sagacity with which faults are traced to their proper source.

If the real inspector thus envelop himself in such a medium, the real teacher is no worse provided, though the constant constituents are different in the second case, being common sense and love of learning. The former preserves him from the ruts of self-conceit and narrow-mindedness; the latter teaches him the value even of a bitter tonic.

The contact is not always thus free from concussion, however. Where either of the twain lacks the essentials of the preservative medium the laws of rigid dynamics hold good, and the weaker yields to the reaction. This is usually manifested in the typical case where an inspector, zealous and strong in purpose, meets a teacher who lacks these very qualities. The latter must needs travel the way of the predominating force for a time at least, though the time may be short to begin with.

The other case is perhaps less common, but it must needs occur. The inspector whose mind is well balanced and ever open to impression must now and then meet a member of the teaching profession from whom he may learn something of value. In this contact the inspector gains what may raise his ideals in some particular, and, if he be a man of strong character, his loftier ideals will carry weight in his future work.

The reader whose bent is towards the mathematical sciences will doubtless trace more deeply the results of these phenomena. If he belong to either of the classes with which we have dealt, he may derive from the consideration of the subject some support in future occasions of contact, some added width of view in his profession, or some material for thought in moments of meditation.

NOTE ON THE EDUCATION ESTIMATES.

THE Education Estimates for 1905-6 show no very striking changes from those for 1904-5. The total amount of the vote is £16,328,947, as against £15,795,538, last year—a net increase of £533,409; but these totals include the expenditure on museums, picture galleries, Universities, and public education in Scotland and Ireland. In round figures, for the more strictly educational services England and Wales takes £12,500,000, Scotland nearly £2,000,000, and Ireland nearly £1,500,000. Administration at the English Board of Education will cost £169,332 in 1905-6 (an increase of about £4,000). There will be an increase of £26,000 in expenditure on secondary schools— (£242,500, against £216,000). Inspection and examination remains at about £260,000, and the grants to elementary schools (nearly 11,000,000) show a relatively small increase.

The secondary schools administrative staff will be increased by one senior examiner and one junior examiner. There are important changes in the arrangements for the inspection of schools. Eighteen Inspectors for Secondary Schools are provided at salaries of £400, rising by £20 to £800. "Junior Inspectors" are no longer classified under Elementary, Secondary, and Technical; but under Miscellaneous Inspection and Examination there appears the large new item "Fees for assistance in examination and occasional inspection, £14,000." This includes several sums formerly specified separately: but the balance should be sufficient to provide luxurious inspection for Eton and other public schools, which, it is understood, are accepting voluntary inspection by the Board. Last year thirty-three Whitehall and thirty-four South Kensington Junior Inspectors were provided for; this year, we have the item of £14,000 already mentioned, thirty Junior Inspectors (unclassified), and a staff of women inspectors (one Chief and eleven Inspectors).

The estimated increase in "Grants in lieu of Fees in Public Elementary Schools" is only £134,500. It will be surprising if this sum is not considerably exceeded, in view of the general abolition of school fees. The aid grants made under the Act of 1902 stand at £2,432,000, against £2,362,000 for 1904-6. A new item, "Payments under the Education (Local Authorities Default) Act, £1,000," is suggestive. The increases in the grants for the training of teachers are smaller than might be expected, but £10,000 is put down for the promised building grant for training colleges, and the training of pupil-teachers is responsible for an increase of £50,000. Local science and art scholarships are estimated at £9,300, a surprisingly small sum, in view of the great excitement caused by the proposal to abolish this form of aid.

The most disappointing feature of the new Estimates is the smallness of the grants for secondary schools. The miserable increase of only £26,000 indicates an alarming apathy to the needs of secondary education. A Government which can find nearly £2,500,000 per annum as jam for the Education Pill of 1902 could get together a few hundred thousands for secondary education if it felt so disposed. Perhaps our Education Minister does not insist enough, or it may be the fault of the Local Authorities and the public. Public clamour has certainly produced a striking result in regard to the Government's contribution to the training of teachers. It is also responsible for an increase in the grants to Colleges in Great Britain of £46,000 (from £54,000 to £100,000).

JOTTINGS.

THE Council's Report of the Girls' Public Day School Company for 1904 shows continuous prosperity. One school during the year has been closed, bringing the number to thirty-three, but the number of pupils has increased by 115. After paying a dividend of 4 per cent. to shareholders, a balance of (roughly) £4,000 is carried forward. From the "Details of Expenditure" we may deduce some interesting figures. The average fee per pupil is £15. 18s., and the average cost £13. 17s., of which £10. 10s. is for salaries. The grants received from the Board of Education amounted to £4,205—an increase of £1,199 on the previous year. But the most important paragraph in the report is the announcement that the negotiations of the Council with the Board of Education for turning the Company into a Trust under a scheme which should at once secure the shareholders' interests and maintain the work of the Company on the present lines are nearly concluded. The Board meanwhile will continue existing grants till next July.

MR. CHARLES GODFREY, assistant master at Winchester College, has been appointed Head Master of the Royal Naval College, Osborne,

vice Mr. C. E. Ashford, who has been transferred to the Royal Naval College, Dartmouth.

THE Rev. M. G. Glazebrook has announced his intention of resigning the Head Mastership of Clifton College, which he will have held for nearly fifteen years. Mr. Glazebrook was a scholar of Balliol College, and obtained a First in Final Classical Schools in 1877. For ten years he was assistant master at Harrow, then for three years High Master of the Manchester Grammar School, whence he passed in 1861 to Clifton, on the retirement of Archdeacon Wilson. After a well earned rest of a year or two he intends to devote himself to literary work.

THE nomination for the Head Mastership of the City of London School rests with a body of six Professors—three from University College and three from King's College. These select three names, which are sent up to the Court of Common Council for the final decision.

FOR the Head Mastership of St. Paul's School we are informed that Mr. R. F. Cholmeley and the Rev. R. J. Walker, members of the present staff, are candidates.

THE Head Mastership of the Grammar School, Stourbridge, will be vacant after Midsummer. The present emoluments amount to £600 a year with a house. Applications must be received on or before May 20.

MR. J. H. HOWGATE, of the Lady Manners School, Bakewell, has been appointed Head Master of Huntingdon Grammar School.

DR. WILLIAMS, of Swansea Grammar School, has been appointed Director of Education for Swansea.

THE governing body of Eton have perused the answers to their interrogatory (profanely termed "Sunday questions"), and have interviewed six candidates. It is reported that the three between whom the final choice will lie are Canon Lyttelton, the Rev. Lionel Ford, and Mr. Rawlins—two past and one present Eton master.

THE head mistress of a girls' high school sends us a *verbatim* copy of an excuse received by her for a pupil's absence: "Please excuse my daughter for she came home in the afternoon because his aunts son died so she went with his mother to the funeral there for Please kindly excuse him."

WE rejoice to hear from Dr. Joseph Wood that Harrow School has secured the estate of 250 acres for the purchase of which an appeal was made some two years ago, at a cost of £75,000. The school is thus secure on the London side against further encroachments of the builder. A heavy mortgage has still to be paid off, and Dr. Wood appeals to Harrovians for further subscriptions.

MR. W. G. GRACE, a master at the Royal College, Osborne, and a son of Dr. W. G. Grace the cricketer, died at Osborne after an operation for appendicitis.

THE Rev. J. H. Raven writes: "Can you or any of your readers tell me the source of a pentameter I found years ago inscribed on the back of a cricket-bat, and if there was an original hexameter to complete a couplet? I have supplied one from the classics, with only a change in one letter, making the distich:

"Kara avis in terris, nigroque simillima cyclo!
Sphaera ruit praeceps: ecce videtur anas!"
(*cyclo* in the sense of 'blob,' a modernism for the classical 'duck')."

The Rev. A. F. E. Forman, who died at Repton on February 13, after an attack of influenza, was one of the oldest and most respected masters of the school. Educated at Sherborne under Dr. Harper, he proceeded to Trinity College, Oxford, and took his degree in 1873 with a Second Class in History. In 1874 he was appointed to a mastership at Repton, where he started and organized the Modern Side. To him in no small measure are due the successes of the school in the cricket field, which culminated in Mr. C. B. Fry, and the establishment of the Old Reptonian Society, which now numbers over 1,200 members.

To count the votes of assistant masters on the Greek question seems to "A. J. B." (*Athenaeum*, March 4) as otiose as it would be to poll the engine-drivers of the country as a guide to the decision of some problem in thermodynamics. They have taken to teaching (nintenths of them) "not from any special interest in, or capacity for, the

instruction of their juniors," but simply as the readiest way of making a living! And yet, when Prof. Ray Lankester hinted that classical head masters were personally interested in maintaining the *status quo*, he was howled at as an underbred, unmannerly man of science!

WE would call attention to two useful publications of the School Nature-study Union: (1) "Facilities for Nature Study offered by Museums and Gardens in and near London"; (2) "List of Books suitable for Nature Study." They may be obtained from the Hon. Treasurer, Miss K. M. Hall, 77 High Street, Whitechapel, E., price 2d. each.

MR. H. W. EVE has reprinted in pamphlet form (Messrs. Nutt) his article on "The Teaching of Modern Languages" contributed to the "Symposium on National Education"—a volume which, though only four years old, is now forgotten as a Blue Book.

THE Council of the College of Preceptors have elected as Examiner in the Theory and Practice of Education Prof. J. W. Adamson; in Latin Mr. F. T. Ritchie; in Hebrew Dr. Hirsch; and in Dutch Mr. Proper.

WE understand that the Incorporated Association of Head Masters and that of Head Mistresses have given in their adhesion to the scheme for a Federation of Secondary Teachers. The other bodies invited to join are still deliberating, and the essential points of conditions of membership and the amount to be contributed are still open questions.

WHEN Bishop Thirlwall was told that at Cambridge the choice lay between compulsory religion and no religion at all he replied: "The distinction is too subtle for my limited intelligence." For "religion" read "Greek."

A TEACHER recently appointed to a class in an elementary school (Standard III.) noticed the unintelligent manner in which the Lord's Prayer was repeated morning and evening by the school, and determined to test the boys' knowledge on paper. He has sent us the actual results. Only one boy out of fifty-eight wrote out the Prayer without a mistake. This, perhaps, will not surprise us, considering the age, but what will be, if not a surprise, at any rate a warning, to teachers is the nature of the mistakes, apart from spelling, which reveal a total ignorance or perversion of the meaning. "Our Father which chart in heaven, allow be thy name," is a favourite beginning. Here is a variation: "Our Father, be short in heaven, our Lord be thy name." These are mere samples. After perusing the batch, we have no hesitation in saying that as far as religion is concerned half the class might as well have repeated "Enos lases juvate."

PRINTERS and writers beware! is the burden of a resolution issued by the Convention of the Royal Burghs in Scotland. He who writes the history of Britain after the Union of the Scotch and English Crowns in 1707 must eschew the words "England" and "English" if his work is to be acceptable on the other side of the border. At the instance of Sir Robert Cranston, Lord Provost of Edinburgh, strong representations on this subject are to be made to the Scotch Education Department, to School Boards, and to educational publishers.

THE members of University College, London, have agreed, on the motion of Lord Reay, to sign their own death-warrant. In other words, they will support the Council of the College in promoting a Bill in Parliament whereby the College shall be transferred to the University of London. The College has some seventeen hundred students who will thus form the nucleus of a real teaching University. Further progress depends upon the liberality of the citizens of the richest city in the world.

WHAT is the market value of a knowledge of the classics? The University of London requires a First Division clerk, who should be a graduate, but must in any case be "sufficiently acquainted with Latin, Greek, and German to correct proofs in those languages." He will have to give the "highest guarantees of trustworthiness." In return for the capital in time and money invested in the acquisition of these languages, his salary will start at £120 and will ultimately rise to £150.

AT the recent King's Scholarship Examination 1,506 men and 4,245 women qualified for admission to training colleges. In all the colleges in England there are about 4,800 vacant places. Consequently nearly a thousand qualified students will be unable to find places.

MR. UPCOTT'S report states that there are now 798 boys at Christ's Hospital (Horsham) and 138 girls at Hertford.

(Continued on page 262.)

EASTER 1905.

THE Virgil Piano School

WILL HOLD A

TWO WEEKS' HOLIDAY . .

COURSE FOR TEACHERS

AT

CLAVIER HALL, 12 Princes Street, Hanover
Square, London, W.,

FROM 17TH TO 29TH APRIL.

An excellent opportunity for Teachers to become acquainted with the VIRGIL CLAVIER METHOD—the most direct, successful, and altogether best system for the teaching, study, and practice of Pianoforte Technique.

The Virgil Clavier Method, being a truly educational method, is invaluable alike to Schools, Teachers, and Students.

Over 2,000 Teachers have already attended previous Courses.

Further Particulars on application to the SECRETARY.

HORLE'S INK POWDERS

TESTED AND FOUND RELIABLE.

100,000 Tins Sold to the

MODERN MATHEMATICAL BOOKS.

NEW SCHOOL ARITHMETIC. By CHARLES PENDLEBURY, M.A. With or without Answers, 4s. 6d.; or in Two Parts, 2s. 6d. each.

* The new School Arithmetic is to a great extent a new book, and not merely a revision of the present work. The original Arithmetic will also be kept in print, and will be revised and kept up to date with each new edition, as hitherto.

NEW SCHOOL EXAMPLES IN ARITHMETIC. Extracted from the above. With or without Answers, 3s.; or in Two Parts, without Answers, 1s. 6d. and 2s.

ELEMENTARY ALGEBRA. By W. M. BAKER, M.A., and A. A. BOURNE, M.A. Revised Edition. 4s. 6d. Also in Parts.

PART I.—To Quadratic Equations. 2s. 6d.; or with Answers, 3s.

PART II.—Including Logarithms (4-Figure Tables), Binomial Theorem, Exponential and Logarithmic Series, Interest, Undetermined Coefficients, and Partial Fractions. With or without Answers, 2s. 6d.

TEACHERS' EDITION, with the Answers to each set of Examples printed opposite them. Two Parts, 5s. net each.

EXAMPLES IN ALGEBRA. Extracted from the above, with or without Answers, 3s.; or in Two Parts: PART I., 1s. 6d., or with Answers, 2s.; PART II., with or without Answers, 2s.

EXAMPLES IN ALGEBRA. By C. O. TUCKEY, M.A. Fourth Edition. With or without Answers, 3s.

These Examples are intended to provide a complete course of Elementary Algebra for classes in which the book work is supplied by the teacher.

ELEMENTARY GEOMETRY. By W. M. BAKER, M.A., and A. A. BOURNE, M.A. Complete Third Edition, Revised, 4s. 6d. Also in Parts. Books I.—III., Seventh Edition, Revised, 2s. 6d. Books I.—IV., Fourth Edition, 3s.

Also published in the following forms:—

Book I., 1s. Books I. and II., 1s. 6d. Books II. and III., 1s. 6d. Books III. and IV., 1s. 6d. Books II.—IV., 2s. 6d. Book IV., 1s. Books IV. and V., 2s. Book V., 1s. 6d. Books IV.—VII., 3s. Books V.—VII., 2s. 6d.

ANSWERS TO NUMERICAL AND MENSURATION EXAMPLES. 6d.
COMPLETE KEY, 6s. net.

EXAMPLES IN PRACTICAL GEOMETRY AND MENSURATION. By J. W. MARSHALL, M.A., and C. O. TUCKEY, M.A. With or without Answers, 1s. 6d.

A NEW TRIGONOMETRY FOR SCHOOLS. By W. G. BORCHARDT, M.A., and the Rev. A. D. FERROTT, M.A. 4s. 6d. Also in Two Parts, 2s. 6d. each.

The Authors hope that this book will supply the need felt for a Trigonometry based on *four-figure Logarithm Tables*, the authorities responsible for the various Cambridge Examinations, Army Entrance Examinations, &c., now dispensing with seven-figure Logarithms. The book lays stress on the more *practical parts* of the subject. *Squared paper* is freely made use of, and 600 Miscellaneous Examples are provided.

DIFFERENTIAL CALCULUS FOR BEGINNERS. By ALFRED LODGE, M.A., Mathematical Master at Charterhouse. With an Introduction by Sir OLIVER LODGE, D.Sc., F.R.S., LL.D., Principal of the University of Birmingham. 4s. 6d.

BELL'S FRENCH COURSE. By R. P. ATHERTON, M.A., Assistant Master at Haileybury College. In Two Parts. With numerous Illustrations. Crown 8vo, 1s. 6d. each.

Key to the Exercises, Part I., 6d. net; Part II., 1s. net.

"The lessons are thoroughly progressive and exceedingly intelligent in their points. The selections for reading exercises are well chosen, and the lessons in grammar not only complete the book, but help towards its value as a teaching medium. In every sense the volume is a success."—*Practical Teacher*.

Gasc's French Dictionaries.

Third Edition, Revised. Medium 16mo, treble columns, xii + 941 pages, 3s. 6d.; or in Two Parts, 2s. each.

GASC'S CONCISE DICTIONARY.

"It furnishes all that the schoolboy wants, and deserves the same popularity that the large work has attained. It is a thoroughly sound and scholarly dictionary."—*The Journal of Education*.

"Should be widely appreciated."—*Athenaeum*.

70th Thousand. 16mo, 2s. 6d.

GASC'S POCKET DICTIONARY.

BELL'S ILLUSTRATED CLASSICS.

Edited by E. C. MARCHANT, M.A., Fellow of Lincoln College, Oxford. With or without Vocabularies. 1s. 6d. each.

A SELECTION.

BELL'S LATIN COURSE for the FIRST YEAR. In Three Parts. By E. C. MARCHANT, M.A., and J. G. SPENCER, B.A. With Coloured Plates and numerous other Illustrations. Crown 8vo, price 1s. 6d. each.

BELL'S CONCISE LATIN COURSE. By E. C. MARCHANT, M.A., and J. G. SPENCER, B.A. 2s.

* The "Concise Latin Course" is intended for use in Schools where it is impossible to give so much time to Latin as is necessary for "Bell's Latin Course" in three parts. It is complete in itself, containing Grammar, Exercises, and Vocabulary.

BELL'S ILLUSTRATED LATIN READERS

Edited by E. C. MARCHANT, M.A.

SCALAE PRIMAE. Simple Stories for Translation. With Notes and Vocabulary by J. G. SPENCER, B.A., St. Paul's Preparatory School. With 29 Illustrations. Third Edition. 1s.

SCALAE MEDIAE. Extracts from Eutropius and Caesar. With Notes and Vocabulary by PERCY A. UNDERHILL, M.A. With 20 Illustrations. Fourth Edition. 1s.

SCALAE TERTIAE. Graduated Extracts in Verse and Prose from Phaedrus, Ovid, Nepos, and Cicero. With Notes and Vocabulary by E. C. MARCHANT, M.A. With 28 Illustrations. 1s.

CLIMAX PROTÉ. A First Greek Reader. In Two Progressive Parts. With Hints and Vocabulary. By E. C. MARCHANT, M.A. Crown 8vo, with Thirty Illustrations, 1s. 6d.

MILITARY AND NAVAL EPISODES. Selected for translation into German, and Edited with English-German Vocabulary and Notes. By ALOYS WEISS, Ph.D., Professor of German at the R.M.A., Woolwich. Crown 8vo, 3s.

HANDBOOK OF GERMAN LITERATURE. By MARY E. PHILLIPS, L.L.A. With Introduction by Dr. A. WEISS.

LONDON: GEORGE BELL & SONS, PORTUGAL STREET, LINCOLN'S INN, W.C.

THE Sub-Committee of the Head Masters' Conference on Pupil Teachers has met. The fact has been communicated to the Press.

SEVERAL of our readers have been stumped by the geometrical puzzle:—"A brick measures 5 inches in length, 2 in breadth, and 2 in thickness. Show that it can be divided into six cubes." The solution is: "Two cubes of 2 inches and four cubes of 1 inch."

THE *Lancet* tells us that there are 1,724 medical students in the Universities of Switzerland. Of these 766 only are men, while 958 are women. At Lausanne there are 223 women to 103 men.

THE annual report of the Joint Scholarships Board shows that nearly ten thousand candidates have been examined during the past year. But the new scheme of the London County Council for the examination of its junior scholars will lessen the work of the Board for the coming year.

THE published class lists show over seventeen thousand candidates entered for the Cambridge Local Examination last December.

MR. W. A. NEWSOME has been elected Chairman of the Joint Agency Committee.

FROM the *Times* of March 20, 1805—a century ago:

FEMALE EDUCATION.—A number of respectable Families in the Town of Stirling, North Britain, are desirous to have a LADY, qualified to TEACH the ENGLISH LANGUAGE with propriety, and Needle-work in its various branches. The number of Scholars to commence with will be twenty-five, and not to exceed 30, for which liberal terms will be allowed. It will likewise be requisite that the lady be qualified to teach Music, Drawing, and French, for which she will be entitled to charge separately, to those who wish their Children educated in either of these branches. To make this an object to a person of the first abilities, the ladies' Families will ensure the Lady in a sum not less than 25 guineas annually, for 3 years, and that exclusive of the School-fees, until the School is properly established. A person educated in England, and not under 30 years of age, nor much above it, will be preferred; and none but of the most respectable moral character and abilities will be listened to. Applications by letter, post paid, to be made to John Glas, Esq. in Stirling, North Britain.

IF any teacher interested in the spelling and printing of classical texts has not received a circular of questions from Prof. Postgate, 54 Bateman Street, Cambridge, he should write for one.

THE University of Marburg has, for the first time, conferred a degree upon a woman. The recipient is a Japanese lady.

"L'ENTENTE CORDIALE" offers two travelling scholarships for competition. Information can be had from J. Belfond, Esq., Broglence Villa, Melrose Terrace, West Kensington Park.

MR. R. P. SCOTT, LL.D., was presented on Saturday, March 18, at the College of Preceptors, with a testimonial, in recognition of his services to educational organization and progress. It took the form of a solid silver salver with an engraved inscription and an envelope containing a cheque for a considerable sum. Canon Bell (late Master of Marlborough College), who presided, referred to Dr. Scott's founding of the Association of Head Masters, and his work as head of Parmer's Schools. Sir Phillip Magnus emphasized the ability of Dr. Scott, which had secured him the appointment of Inspector of Secondary Schools, and the advice and help he had given to the Board of Education in framing the Education Act of 1902.

THE University of Leeds sends us notice of a number of scholarships open to competition during the present year. Information can be obtained from the Registrar.

THE London County Council advertised for one chief and nine assistant examiners in English Composition and Arithmetic in their Scholarship Competition at fees of £100 and £50 respectively. More than two thousand candidates offered themselves. As no qualifications were attached, we wonder the number did not run into five figures. Every one thinks he can write English and do sums; *a fortiori*, that he can examine on these subjects.

NATURE STUDY.—Girls required to show up weekly record of observations. Notes of small girl: "Polly Anthers much the same; my sickly man [cyclamen] is doing well."

CASELL & CO.'S LIST.

CLASSICS.

B. J. Hayes, M.A. Lond. and Camb., Gold Medallist in Classics at M.A. Lond., First Class Honours in Classics, Cambridge.

T. T. Jeffery, M.A., First Class in the Classical Tripos, late Fellow of St. Peter's College, Cambridge.

F. G. Plaistowe, M.A. Lond. and Camb., Gold Medallist in Classics at M.A. Lond.

W. J. V. Stead, M.A. Lond., First Class Honourman in Classics at B.A.

W. P. Steen, M.A. Lond. and R.U.I., Gold Medallist in Classics.

J. F. Stout, B.A. Camb., First Class Honourman in the Classical Tripos.

A. F. Watt, M.A. Oxon., First Class Honourman in Moderations and at the Final Classical Examination.

MODERN LANGUAGES.

S. Dickson Brown, M.A. Lond., Honourman in English at B.A.

S. E. Goggin, B.A. Lond., Honourman in English at B.A.

J. W. Horrocks, M.A. Lond., (History).

W. Moseley Kerby, M.A. Lond., (French).

Allen Mawer, B.A. Lond., First Class Honourman in English at B.A., First Class with Distinction in the Modern Languages Tripos.

S. R. Webster, B.A. Lond., First in First Class Honours in French and German.

A. J. Wyatt, M.A. Lond. and Camb., First of his year in Branch IV. (English and French).

MATHEMATICS.

Harry Bateman, B.A. Camb., Senior Wrangler, First Class, Div. I., Pt. II., of the Mathematical Tripos.

William Brown, M.A. Camb., 21st Wrangler.

A. G. Cracknell, M.A. Camb., B.Sc. Lond., 6th Wrangler, First in Honours at London Matric.

C. S. Crosby, M.A. Camb., 14th Wrangler.

I. H. Hersch, M.A. Camb., 14th Wrangler.

G. F. Perrott, M.A. Camb., 27th Wrangler.

Bion Reynolds, M.A. Lond. and Camb., 19th Wrangler in the Mathematical Tripos.

Fabian Rosenberg, B.Sc. Lond., M.A. Camb., 16th Wrangler, Second in Honours at London Matric.

SCIENCE.

C. W. C. Barlow, M.A. Lond. and Camb., B.Sc. Lond., Gold Medallist in Mathematics at M.A.

H. W. Bausor, M.A. Camb., First Class in Natural Sciences Tripos.

J. T. Cunningham, M.A., late Fellow of University College, Oxford.

G. H. Delf, B.Sc. Lond., First Class Honours in Chemistry at B.Sc.

M. C. W. Irvine, M.A. Camb., Honourman in the Moral Sciences Tripos.

John Satterly, B.Sc. Lond., First Class Honours in Physics at Int. Sc. and at B.Sc.

J. W. Shepherd, B.Sc. Lond., First in First Class Honours in Chemistry at Intermediate Science and at B.Sc.

THE JOURNAL OF EDUCATION.

A MONTHLY RECORD AND REVIEW.

SCALE FOR ADVERTISEMENTS.

PUBLISHERS' ANNOUNCEMENTS—

Whole Page ...	£5 10 0	Half Page ...	£3 0 0
Quarter Page ...	1 15 0	One-Eighth Page ...	0 17 6
Per Inch in Column, 8/-.			

PREPAID RATES FOR SCHOOL ANNOUNCEMENTS—

Scholarships, Official Notices, School Transfers, Partnerships, &c.—6d. per line; minimum charge, 5s.

Posts Wanted or Vacant.—30 words for 2s.; each 10 words after, 6d.

Lectures, Classes, Non-Resident Posts, &c.—48 words for 3s.; each 8 words after, 6d.

An extra fee of ONE SHILLING is charged on advertisements with OFFICE ADDRESS.

Date of publication of next issue will be found at top left-hand corner of front page. [Advertisers are reminded that "Letters addressed to INITIALS or to FICTITIOUS NAMES, or to a CHRISTIAN NAME without a SURNAME," at Post Offices are not taken in, but are sent at once to the Returned Letter Office.]

All Letters respecting Advertisements and Subscriptions should be addressed—"THE PUBLISHER," JOURNAL OF EDUCATION Office, 3 BROADWAY, LUDGATE HILL, E.C. Money and Postal Orders, on the Post Office, Ludgate Circus, E.C., should be made payable to WILLIAM RICE; Orders and Cheques may be crossed, "The London City and Midland Bank, Ludgate Branch." Postage stamps can only be received at the rate of thirteen to the shilling.

If a receipt is required for an advertisement under 10s., a postcard or a stamped envelope must be enclosed.

Notice must be given of all remittances through the Post Office from abroad, stating full name and address of the sender; and all Foreign Money Orders must be crossed for payment through a Bank.

LONDON: WILLIAM RICE, 3 BROADWAY, LUDGATE HILL, E.C.

THE GREEK DEFEAT, AND AFTER.

THE question of compulsory Greek at Cambridge has gone against us. We were never very sanguine of victory, but we confess that we did not anticipate such a crushing defeat. By three to two in a full house the Masters of Arts have pronounced that, except in the case of affiliated students and Orientals, a *modicum* of Greek shall be exacted from all candidates for a degree. If we endeavour to account for this adverse vote, we have no desire to minimize its significance. To judge by past history, it will be another ten years before the attack can be renewed with any prospect of success. It is, however, possible that before that time a Royal Commission may give the University a new constitution. To us, we confess, it appears an indefensible anomaly that the legislative power should be vested in a nondescript body of graduates, nine-tenths of whom are non-resident; and it is no less an anachronism that the degree which confers a vote should be a mere matter of pounds sterling. The result is that the clergy, if agreed among themselves, are able to resist any educational reform, and could to-morrow, if they were so minded, impose Hebrew as a compulsory subject. In the present instance we may safely attribute to the clerical vote the retention of an obsolete text-book which, a generation ago, was irreverently nicknamed by a descendant of the author "Tales of my Grandfather." Why should not University teachers, like head masters, be allowed to settle their own affairs? The Governing Body of Eton has just been asking candidates for the head mastership what is their opinion of the present Eton system, and what changes they would, if appointed, propose to make. Dr. H. M. Butler, when asked by the Public Schools Commission if there were any changes he desired to see in the organization of Harrow, replied: "None—or I should have made them." Many think that this absolute monarchy should be checked and limited, but no one would propose to refer the question of tutors at Eton or home-boarders at Harrow to a *plébiscite* of Old Etonians or Old Harrovians.

But the present majority, though it was determined by outsiders and swollen by the country clergy, is not wholly thus

explained. Even had it been left to the votes of residents, it is doubtful how the day would have gone. The *non-placet* vote was determined by considerations as various and discrepant as those which gave the Government a majority on Mr. Winston Churchill's motion. A full analysis of the motives which influenced the dissentients would be laborious and not very profitable, but it is worth while to indicate some of the less obvious.

First, we may put the argument of the *Times*—which throughout the controversy had backed the reformers, but after the defeat told them that, though right in principle, they went the wrong way to work. "It was a mistake to raise so great a question as the place of Greek in higher education upon the comparatively minor issue of the regulations for a pass examination in which the point that has to be considered is a minimum of attainment." As we know, in the political world every measure of reform is open to the charge of "tinkering" and "piecemeal legislation." In most cases it is merely a move in the game of obstruction, but here we must confess our sympathy with those of our opponents who (like Dr. Butcher) would have the University organized by Faculties—only we fail to follow his argument that the changes proposed by the Syndicate would make chaos worse confounded, and block the way for any larger method of reform. It seems to us, on the contrary, that the provision of alternatives in the entrance examination would facilitate the future delimitation of special courses for special students.

Next came the argument that the two older Universities must move together if they move at all. They are pictured as Siamese twins: no operation, however slight, could be performed on the one without affecting the constitution of the other. Make Greek optional at the one, and the other, which preserves the old tradition, will come to be regarded as the home and refuge of classical scholarship. It need hardly be pointed out that such a view, if pressed, would put Oxford and Cambridge in the ridiculous attitude of Sir Richard Strachan and the Earl of Chatham. It is not obvious why the removal of a barrier should keep any away. The argument can have no force except on the presumption that the pure classicist would be degraded or contaminated by admixture with the modernist unregenerated by Greek; and those who urge it are apparently unable to conceive that an influx of students of science might compensate a possible loss of classical scholars.

Thirdly, not a few who approved the general principle of the recommendations took exception to particulars and consequently withheld their vote. It is true that the revised scheme of the Syndicate removed some of the objections raised in the previous debate, but it is a heavy handicap on any measure of University reform that no amendment can be proposed or accepted. It was assuredly not the intention of the Syndicate to provide a soft option for Greek, and their backers—Dr. Breul, Mr. MacClure, and Mr. Eve—protested no less strongly than their opponents against any such interpretation; but the phrase "*easy translation from French and German*" was an unfortunate one, to which both friends and foes took exception. We think that the Syndics made mistakes also in allowing two modern languages without composition to count as equivalent to one with composition and not including *viva voce*. A comparison, however, between the "unseens" set respectively in ancient and modern languages in the Cambridge Local Examinations might have given assurance that there was no danger of the moderns being let off too lightly.

Lastly, with Dr. Butcher and the *non-placets* who opposed the reform as botching, piecemeal, and patchwork, were ranged those who thought it too sweeping. These would have been prepared to go as far as the Oxford reformers, and exempt from Greek candidates for Honours in Science and Mathematics. We sincerely hope that no attempt will be made to carry such a partial and inadequate measure of relief. How is it possible at entrance to divide the sheep from the goats? Further, it is the Poll man, not the Honours man, whose burden needs to be lightened. To the Honours man Greek is a *gêne*, and, as we hold, a useless annoyance. To the Poll man, who has been trained on the modern side, it is a barbed-wire fence. Again, why should the candidate for the Law or History or Medieval and Modern Language Tripos be compelled to enter through the strait gate of Greek any more than the Mathematician?

We have pointed out some of the causes which brought about the defeat of a reform, confessedly partial, but, as we have

viewed it, a salutary step in the right direction. Our criticisms have been mainly negative, and we can only indicate what, in our opinion, should be the future policy of reformers. We may accept without reserve the two principles laid down in the *Times* leader to which we have referred: the doors of the University must be thrown open to all genuine students, and newer studies must be recognized as vehicles of a liberal education equally with the older classical course. But, even were all agreed upon the end, we doubt whether, under its present constitution, either Cambridge or Oxford could carry out the organic changes involved. It is more than a quarter of a century since the Oxford and Cambridge University Bill was carried by a Conservative Government. Is not the time ripe for another Royal University Commission?

[Since the above was written we have learnt that the Syndicate, reinforced by four additional members, is continuing its labours, and will probably propound a scheme for the creation of new degrees. Its work, if successful, might obviate the necessity of a Royal Commission, and in any case it would pave the way and expedite the work of the Commission.]

REVIEWS AND MINOR NOTICES.

Roman Society from Nero to Marcus Aurelius. By SAMUEL DILL. (Price 15s. net. Macmillan.)

In order to write a great book on such a matter as Roman society during a century and a quarter of national life a man must bring much to the task. Besides having a close acquaintance with the relevant texts, he must have studied the outside sources of information by which they are explained, confirmed, or supplemented. Coins and inscriptions (the neglect of which impaired Merivale's lucid and persuasive History) are as necessary for him as ancient books. Then to a knowledge of these first-hand authorities he must have added a minute survey of what is called, not with universal appropriateness, the "literature" of his subject. Articles in scientific journals, monographs, dissertations, and the like learned tracts multiply nowadays rapidly about every disputed point; so that even our highly developed resources of catalogue and index will scarce have enabled him to grapple with their contents. Nor yet is the utmost zeal in gathering facts enough: he must, further, be endowed with the critical faculty, and he must have some power of presenting his accumulations in a good order and in attractive speech. Lacking these acquirements and gifts utterly, he will labour in vain.

Prof. Dill, of Queen's College, Belfast, who has already investigated social history in the last century of the Western Empire, now makes the time from Nero to Marcus Aurelius his theme. As to his qualifications, we are confident that he knows his authors well, and he has drawn sufficiently on inscriptions. "The Circle of the Younger Pliny" (Book ii., c. 1), for example, is a model of penetrating study in contemporary evidence. Prof. Dill is less strong in the secondary authorities. We have not been able to convince ourselves that he has always been in touch with the latest inquiries. At the first glance we observe that he does not use the common notation by which the editions used are conveniently indicated. Why did he not, for instance, on page 92 send us to Friedländer thus: "*Sittengesch.* i, 231"? Was it for fear of betraying that the reference is to a work forty years old, and that he has not troubled to provide himself with the newest edition even of the most important text-book relating to his subject? Such negligence is a source of error in his results. Any book of reference issued recently would have taught him that Statius, "*Silv.*" iii. 3, is not a panegyric on Claudius Etruscus, but a poem of consolation addressed to Claudius Etruscus on the death of his father, who, it may be assumed, was named Claudius, but who is nowhere styled Etruscus. We give one other instance of belated learning: when he talks of the *taurobolium* he bids us go to the well known verses of Prudentius, which describe how the bull, being slain, bathed with its consecrating blood the votary stationed in a trench below. But Prudentius is only authoritative for the fourth century. Earlier inscriptions, as the latest researches have proved, know nothing of the *taurobolium* as a consecra-

tion, and exhibit it as a sacrifice. Now it is just in its sacrificial aspect that the ceremony belongs to the age that Prof. Dill has chosen to illuminate.

It is a real defect—this deafness to the nearest voices. Nevertheless, we will not lay stress on it unduly. For in getting a large book ready for the press a writer has so much to occupy him that he must close his ears at times if he would make any progress. Let us go on to the third qualification that we have desiderated, and ask whether Prof. Dill has the critical faculty. Not, we venture to think, in the highest degree. Must we justify our opinion? He repeats the statement, not quite indefensible, yet quite improbable, that Aurelian's mother was a priestess of the Sun. Flatterers would naturally endeavour to connect, by this link as by others, the imperial, but base-born, patron of Sun-worship with the *gens Aurelia*, the hereditary guardians of the cult at Rome. But it is the business of criticism to prick the bubbles of adulation, and to reject assertions which, with strong bias, rest on weak testimony. Again, Prof. Dill permits himself to see Tacitus tenderly, yet strictly, guarded from the taint of slave-nurses by an unspotted mother. It were as sober an imagining to represent the historian as suckled by a bright-eyed Italian countrywoman, unfree save in the exercise of a picturesquely mendacious tongue. Such efforts of constructive imagination profit us nothing, and are alien to the spirit of modern criticism. Those who have a proper receptivity for that spirit no longer make them.

As to the manner in which the subject is put before us, we consider the arrangement to be happy, enabling the writer, as it does, to cover the field by means of disquisitions each complete in itself. The language, brilliant in general, has occasional flaws. The "morale of the senatorial order" we had supposed to be a discredited form of speech. *Morale* is sound French; but, if Prof. Dill meant "morality," why did he not say "morality"? As to the word *litterateur*, which he also employs, it being neither good English nor good French, we can only recommend that it should be banished to Jersey. But these are little spots on a wide and bright surface. The book, as a whole, is written in fine, manly English—the English of one for whom words are coins of definite weight, colour, and mintage, not uncertain tokens to be palmed off on the reader for what they will fetch.

We must now sum up, and give with all courtesy the judgment for which we are asked. It will be seen that we have not found our author to possess incontestably all the requisites of a supreme painter of Roman society. Yet he possesses them in such a measure that he has been able to produce, not a great book, but still a good book. It is a book, moreover, of enthralling interest. Not only does it treat of secular life in many phases, but it addresses itself also to the student of religion. For one of its objects is "to show how the later Stoicism and the new Platonism, working in eclectic harmony, strove to supply a rule of conduct and a higher vision of the Divine world." The throes of the ancient world by which it prepared itself for Christianity—that is the subject, to put it in little, which Prof. Dill has handled. He has handled it, not perfectly, but so well that his work will prove indispensable or useful to all who concern themselves with this chapter in the history of civilization. For ourselves, if we have pointed out his weaknesses, we are, nevertheless, grateful to him for his labours. By his literary charm he will draw to educative classical studies some of those who hold aloof or are restrained from them on the ground that classical scholarship is thorny and classical books are gall. That is why we thank him.

An Unwritten Chapter in the History of Education. By H. KINGSMILL MOORE, D.D. (Price 7s. 6d. net. Macmillan.)

The "Chapter" is well worth writing, and no one more fitting and able to write it could be selected than Dr. Kingsmill Moore, the present Principal of the Church of Ireland Training College. The fine buildings of the Training College stand on the site once occupied by the offices and schools of the "Society for the Education of the Poor of Ireland," a society formed in 1811 by a group of Irish gentlemen for the purpose of spreading thoroughly good education among the poor of Ireland, then practically without any education at all. It is noticeable that it was about the same time that the fine schools of the Catholic "Christian Brothers" were started.

The Society lasted till 1831, and accomplished an astonishing

work. It established schools in every part of the country attended by children of all denominations, 90 per cent. of whom were Roman Catholics. On the Council of the Society were men of all religious creeds, and it was with the sanction of the Catholic Bishops that the children attended the schools. The society advanced money for school buildings, assisted schools already existing or started by other philanthropists, trained teachers, brought out whole sets of school-books (almost none existed at the time), and established a thorough system of inspection. There were three remarkable features in the undertaking. First, the vast unselfish work done by the promoters. Three days a week they attended committee meetings beginning at 8 a.m.—providing even their own breakfast and cups and saucers!—while the time and labour given by certain members can never be computed, and all without a penny of remuneration. Secondly, the excellence of the education given, which was based on the Lancastrian system. Eloquent testimony is borne by foreign visitors to the good arrangements of the schools, the teaching, and the inspection. The third feature is the vastness of the work accomplished with comparatively small funds.

At first it was carried on wholly by private subscriptions, but in 1815, public attention having been aroused, Government gave a grant—the first Parliamentary grant given to primary education in these countries. This grant, however, never exceeded £30,000. Compare this with the million and a half expended to-day in Ireland on a population but half that of 1830. With such public support they maintained in 1830 1,634 schools, attended by 100,000 children. Of their cheap books there were sold 957,457. (School lending libraries for home reading were part of their scheme, and suitable books were brought out for them.) Of trained masters they had in 1831 nearly 2,000.

In 1831, after a long struggle, the Government grant was withdrawn, and this remarkable work came to an end—one of the sad endings that mark many pages of Irish history. The cause in this case was, briefly—O'Connell, and the obstinate determination of the Council to adhere to their principle of having a portion of the Bible read each day in school without comment or explanation, all other religious teaching being excluded, while also the teachers were appointed without any regard to creed. O'Connell, for his own purposes, was rousing the hitherto timid and quiet priesthood to political activity. He attacked the schools: the priests refused to allow the children to attend. A Commission was issued that recommended the abolition of the reading of the Bible—which was quite useless apparently to the children—the instruction to be wholly secular, with religious teaching given by the clergy in after hours. The Society refused to give up their principles—a mistake, bearing fatal fruits—and their work had to come to an end. It passed away, and the papers of the Society were thrown aside or stored in cellars. Its work remained unrecorded; it had become a mere tradition when Dr. Moore, in 1884, became Principal of the Kildare Street Training College. He found some of the documents in the old house, and, with unwearied labour, has now brought the past history of the Kildare Place Society to light, and, what is of the greatest interest, fully detailed their methods of teaching and school management. He has told a remarkable story in a very clear and interesting fashion.

Miscellaneous Essays and Addresses. By HENRY SIDGWICK. (Price 10s. net. Macmillan.)

These papers are classed by the editors under the three divisions of literature, economics and sociology, and education. We should add a fourth, religion, which is treated directly in a review of Seeley's "Ecce Homo" and indirectly in the articles on Clough and Matthew Arnold. The paper that will at the present moment excite most attention is "The Theory of Classical Education," which appeared in "Essays on a Liberal Education," a volume long out of print. We have no intention "veterem renovare dolorem," and will only say of it that, in view of the time when it was written and the age of the author, it is a remarkable essay, anticipating most of the arguments with which we have recently been deluged and presenting them with a philosophic breadth that is rare among reformers. Equally striking, though slighter, is the review of Mr. Kidd's "Social Evolution." Shaft after shaft of criticism pricks the inflated

balloon till it collapses, and we are left alone with the professor to speculate on the possibilities of historical prediction.

Where all is good it is perhaps invidious to mark what is less good; but in the literary criticisms Sidgwick seems to us to travel out of his proper sphere. Nothing, for instance, can be happier than the analysis of Clough's temperament, but from the remarks on particular poems we often find ourselves dissenting. Thus "Ite domum" happens to be a favourite of ours, but Sidgwick pronounces most of the song rather commonplace. The exquisite refrain, "Home, Rose, and home, Provence and La Palie," might have shown him that it is kine, not goats, that the girl is driving. On the same page we are told that the "Mari Magno" tales are written in obvious emulation of Crabbe. We hold that they have far more affinity with Chaucer, and the sneer at Coventry Patmore would certainly have disappeared had Sidgwick lived to see the volume through the press. These, after all, are digressions, and the body of the book is a sound vintage that loses nothing or improves with keeping.

An Outline of the Theory of Organic Evolution. By MAYNARD M. METCALF. (Price 10s. 6d. net. Macmillan.)

The title on the cover of this handsome book—"Organic Evolution"—reminds us that the same publishers issued some years ago another work under an identical name—the book by Eimer translated by Cunningham. The book at present under discussion differs, however, widely from its namesake, since it is intended for beginners in natural science, and, as its author puts it, is designed "to give a comprehensive outline of the theory [of evolution], with just sufficient illustration to invite the reader to seek fuller knowledge of the great number of interesting phenomena which are related to the theory." We think that the writer has been singularly successful in carrying out his task, and can recommend his book to all who desire to obtain a general conception of a theory which has attracted, and will still continue to attract, widespread interest and attention. The book is temperately written and most admirably illustrated by coloured and uncoloured plates. The author has evidently grasped the fact that in a subject like this copious illustration not merely assists the comprehension of the reader, but, in addition, saves many pages of explanation. These illustrations will prove, we are sure, of great value to teachers of Nature study. The book would perhaps have been more interesting to the English reader, and some of its facts would certainly have been more easily realizable, had the plants and animals dealt with been European rather than American, but, seeing the place of origin of the book, one has no right to complain of this, and, after all, the reader will gain acquaintance with a series of illustrations of the theory additional to those met with in the pages of English writers on the subject.

Perhaps it is the writer's more complete knowledge of the flora of his own continent which has led him to recommend the late Mr. Grant Allen's book on "The Colours of Flowers" to his readers. We doubt if this recommendation would be endorsed by most English field-botanists. An interesting chapter is devoted to the thorny question of the evolution of man, and the only criticism which we shall make upon this is that it appears to us too much to ignore the undoubted weakness of the positive proofs for such an evolution. Looking at all the aspects of the case, most persons familiar with the facts of anthropology—using that word in its widest sense—would, we fancy, agree that the physical attributes of man, at least, are most easily and satisfactorily explained by such a theory. It must be confessed, however, that conclusive evidence is still wanting, and that, so far, the craniological data afford little help in this direction. We can heartily recommend this interesting work.

"English Men of Letters." New Series.—*Thomas Moore.*

By STEPHEN GWYNN. (Price 2s. net. Macmillan.)

Mr. Gwynn has done his work exceedingly well. We have a clear and sufficient account of Moore's brilliant but fluctuating career, and—what gives real pleasure—receive a charming impression of the little bard, who, gay as a butterfly, the delight of society, in which he himself delighted, impulsive, emotional, half tears, half sunshine, yet possessed so much high principle and dignity, so warm, honest, and faithful a heart, and did for his country a work so far reaching and original. In addition,

Mr. Gwynn gives a just estimate of Moore's genius, which contains many happy touches.

Gone for ever is the charm of "Lalla Rookh," and its fellows—"Lalla Rookh" for which Longmans gave £3,000, the highest sum ever before given for a poem, and declared twenty-five years later that "it was the cream of all their copyrights"! But the Irish melodies and Moore's political satires in verse—to which we think Mr. Gwynn hardly does justice—will never die, while the influence the melodies have had both abroad and in the hearts of his countrymen is only approached, but not attained, by the feeling Scotchmen have for Burns' poetry.

Before Moore, Ireland was voiceless. Except for the eloquence of patriots, lost in the buried records of an extinct Parliament, or—more grim and realistic evidence—entombed in English State Papers, her sufferings and her point of view had obtained no expression in the English tongue. Moore broke that tragic silence. He made Ireland known to the world, and, if the picture he gave was limited by his own personality and knowledge, yet it was one full of beauty and pathos, which aroused all who read his poems or listened to them sung, and was accepted with extraordinary appreciation by Irish people of all classes and creeds. Even now, when a new Ireland has grown up with new singers, we have hardly lost the feeling that Moore's Ireland is the real Ireland, *our* Ireland, so deeply did he influence several generations, so much have his countrymen accepted his voice as the expression of themselves.

As a literary artist it is only in his satirical verse, and in some of the "Melodies" that Moore shows any distinctive gift. As Mr. Gwynn points out, he had neither intellectual strength nor profound passion, nor does he attain to "a class of verse to which hardly any can be preferred—music as simple as a bird's, dealing in the simplest emotions free from all taint of rhetoric." Moreover, he suffers from the fatal sentimentality and conventionality of the style of his day. But he has eloquence, pathos, and sweetness, and in his lighter verse an airy brightness and roguish gaiety, wholly his own. Moore is a unique figure in English literature, and well deserves being included in this series, and in being as efficiently treated as he is by Mr. Gwynn.

A Day at Dulwich. By A. H. GILKES. (Price 1s. net. Longmans.)

The title is reminiscent of "A Day of my Life at Eton," by an Eton boy, and whets our curiosity. What revelation could be more interesting than a page from the diary of a head master, in wit a man, in innocence a child, a combination of the wisdom of Socrates with the ingenuous frankness of Pepys? Such expectations, excited by the title, are doomed to disappointment. The master is a dim presence in the background: twice only is the oracle heard: once to point the inner significance of the lesson appointed for the day, the day of the great football match—"neither taketh He pleasure in any man's legs"—and once to inquire who is to escort the rival team from the station. The booklet is, in fact, an essay on school games and classical study in the manner of a Socratic dialogue, the scene of which is laid at Dulwich. A defence of Greek takes the shape of a lesson or lecture to the sixth on the thesis: "It is by a knowledge of the methods that the Greeks taught to the world that the right way to read the Bible is to be found." It is an eloquent sermon, but we should be anxious to know how such a sentence as the following appeared in the "notes" that the class had to make:—"Here [in the Greek ideal] really is the fourth dimension, that which is, in fact, the removal of all other three dimensions, the removal of measure altogether, the infinite withdrawal of self towards real life." To read the Bible with the open mind of a Greek is sound advice, but this is not the same thing as reading it through Greek spectacles. The Socratic *elenchus* may be a discerner of spirits, but it is not a key to the universe, or even to a sound theory of secondary education. The divinity that doth hedge a head master still shrouds him from our eyes, and the lifted veils shows us "nulla deum effigie, vacuum aedem et inania arcana."

The Speeches of Isaeus. By WILLIAM WYSE. (Price 18s. net. Cambridge University Press.)

The text of Isaeus was edited for Teubner by Thalheim two years ago. An English commentary has long been much needed. The want is now supplied, and a copious *apparatus criticus* is furnished by Mr. Wyse, formerly a Fellow of Trinity College, Cambridge, and sometime

Professor of Greek in University College, London. Although he does not penetrate the language of his author with the loving insight of a Shilleto, he handles the matter with consummate skill. Indeed, it is in the subject-matter that his chief interest lies. "The leading purpose of this edition," he writes, "is to show by analysis of the extant speeches that ancient scholars had a juster appreciation of the orator's art than is shown by modern writers on Greek law, for some of whom his unsupported statements appear to carry the authority of decisions of a Supreme Court; and that to extract truth from the arguments of an advocate bent on winning a verdict from an ignorant tribunal is a more delicate operation than many people seem to suppose." What impresses us most in the book is its *Gründlichkeit*, its thoroughness—a quality wrongly supposed to be the exclusive property of Germans. A sly touch in the introduction we cannot withhold from our readers. Finding fault with Prof. Scholfield's Greek, he adds: "A Prime Minister would have rendered a real service to learning by promoting him to a bishopric." But is it not rather sad for the Church of England if the Episcopal Bench is to be filled from the ranks of unsuccessful schoolmasters and incompetent professors of Greek? That, however, is a parenthesis. The book is excellent. If we dismiss it with a short notice, the reason is that the questions it raises are too technical for our columns. We must be content with recommending it heartily to all students of Attic oratory and Attic law.

A Book of Remembrance. By ELIZABETH GODFREY.
(Price 2s. 6d. net. Methuen.)

A lyrical calendar differing from an anthology only in so far as each poem is more or less closely associated with the season, and is limited in length to a couple of pages or about fifty lines. Three-fourths of the lyrics are modern, and the acknowledgments for permission to use copyright poems occupy three pages of its preface; but the Elizabethans are also well represented. Miss Godfrey has a catholic taste, and has garnered in about equal proportions old and new. Though, as is natural, we miss some of our favourite pieces from the minor poets—William Cory, T. E. Brown, Owen Meredith—yet there are not half-a-dozen that, if we had the revision, we would cut out. If a personal testimony is permissible, there is a lyric by J. Meade Falkner which we cut out of the *Spectator* some years back and welcome again as a lost friend. The lines here left anonymous, "La Vie est vaine," are Maeterlinck's. The other translation admitted is a fragment that does not do justice to Sophocles. Altogether it is a delightful little volume.

French Composition by Imitation. By HUBERT BROWN. (Price 2s. Blackie.)

A piece of English is given with a fair copy facing it (more often, we suspect, it is a piece of French translated into English), and following the English are two variations of the same story, retold in other words and with other constructions. The method is thoroughly sound, and great skill is shown in varying the matter so that the pupils cannot simply copy from the French. Our only objection to the book (if it is an objection) is that it is better fitted for oral than for written work. A master who is careful to avoid all occasions of cheating will scruple to give the order, "cover up the right page before you write." We should, therefore, like to see the book in two parts. This criticism, however, does not apply to the test sentences, which are a useful feature.

(1) "University Tutorial Series."—*Clive's Shilling Arithmetic.* Edited by W. BRIGGS, LL.D., M.A. (2) *Practical Arithmetic.* By A. CONSTERDINE, M.A., and S. O. ANDREW, M.A. (Murray.) (3) *Arithmetical Examples.* By W. G. BORCHARDT, M.A., B.Sc. Second Edition. (Price 3s. Rivingtons.) (4) *Examples in Arithmetic.* By C. PENDLEBURY, M.A. (Price, with or without Answers, 3s. Bell.)

The first of these books follows in the lines of its predecessors, the "Junior," "School," and "Tutorial" Arithmetics. It consists mainly of definitions, rules, and a large series of examples, many of which are to be worked orally. The second volume, one of "Murray's School Library," is more accurately described by its subsidiary title: "An introduction to elementary mathematics for scholars between the ages of nine and twelve." In the second edition of his useful "Arithmetical Examples" Mr. Borchardt has added five new exercises, of which one, consisting of miscellaneous problems on the metric system, is specially deserving of mention. Mr. Pendlebury's "Examples" are extracted from his admirable "New School Arithmetic," and, in their original form, are probably now well known.

Des Vacances à Paris. By VIOLET PARTINGTON.
(Price 1s. 6d. Horace Marshall.)

A simple narrative of a small girl's visit to Paris which is sure to interest small girls. It is nicely illustrated, and there are "construes" of all the hard phrases at the end. The format, obviously adopted to suit the pictures, strikes us as awkward. It is, perhaps, presumptuous to criticize the French of so good a scholar as Miss Partington, but for "Aussi que de questions elle avait posées à sa mère," we should have written "avait-elle," and translated "how many questions" instead of "what."

McDougall's School History of Great Britain and Ireland. With numerous Maps. (Price 1s. 6d. McDougall's Educational Company.)

This is a brief history of the Empire, fitted out with summaries, maps, &c. Part IV. deals with "The Institutions under which we live," and will be found both interesting and useful.

The Harmsworth Encyclopædia is a bold attempt to give the million (here no figure of speech) a work of reference. It is issued in fortnightly parts, price 7d., and will extend to forty parts. In other words, one halfpenny a day continued for twenty months will purchase the complete work. When we add that the matter is wholly new, that each part consists of 160 three-column pages, and that it is profusely illustrated, it will be apparent that unless the sale ran into seven figures the venture could not pay. The list of contributors is sufficient guarantee for the quality of the matter. Thus, on the literary side we find E. Gosse, A. Lang, H. Bradley, G. Saintsbury, and the late W. Besant, to name only a few of the more distinguished. One excellent feature is the bibliography attached to the more important articles.

Précis and Précis Writing. By A. W. READY. Second Edition, Revised. (Price 3s. 6d. Bell.)

Eight introductory pages give clearly and forcibly the essentials of *précis*-writing; then follow fourteen specimens that have been actually set in public examinations. Lastly, we have one specimen fully worked out—rough copy and final copy—and short hints on the others. It is a workmanlike book based on long experience as a private tutor.

Duruy's History of France. Abridged and translated by

Mrs. M. CAREY. (Price 8s. 6d. net. Dean.)

No word is needed to recommend Duruy's "History," which has taken its place as a text-book in France—well planned, sober, judicious, like the statesman himself. Mrs. Carey has done her part well, and her English is idiomatic. For a schoolbook the price is somewhat high; but this is accounted for by the number of good maps.

Astronomical Discovery. By H. H. TURNER. (Price 10s. 6d. net.) Arnold.)

The Savilian Professor of Astronomy, if we may be pardoned a stock quotation, "bears his learning lightly as a flower," and discusses in these six popular lectures the element of chance in astronomical discovery. The vulgar view is well represented by Keats's simile of

"the watcher of the skies

When some new planet swims into his ken,"

and we may accept as almost certain Prof. Turner's conjecture that Keats had in his mind the discovery of Uranus by Sir W. Herschel, in 1781, and of the four minor planets, discovered during the decade preceding the sonnet. We have referred to this as an instance of the literary attractiveness with which the professor invests his scientific narrative. The lecture on Sun-spots is specially appropriate at the present moment.

A Short History of England. By EDWARD CHREYNEY, Professor of European History in the University of Pennsylvania. (Price 6s. 6d. Ginn.)

This book is admirably adapted to its purpose, which is to give a clear and comprehensive view of English history to American students in as small a compass as possible. Some time ago it was a common complaint in England that the anti-English tone in American educational books made anything like real cordiality between the two countries impossible. No such complaint can be made about this history. It is eminently calm and fair—doing justice to both sides in the ever-to-be-regretted quarrel which led to the disruption of 1776, and referring without any bitterness to the line taken by the upper classes in England in the Civil War in America. It begins with a clear account of the geographical position and physical features of the island and of the race elements of the people. The chapters on Pre-historic and Celtic Britain and Roman Britain are good, and there are excellent maps and interesting illustrations all through the book. Each chapter ends with a summary, and to each is added a list of works and poems suitable for the teacher's own study. A book of readings from primary sources to be used in connexion with the text-book is in preparation. The footnotes explaining technical terms are apposite, and not so numerous as to be neglected. They are, of course, mainly for American students, to whom many such terms must be quite unfamiliar. The book is American and for American use, and each nation has, of course, a right to spell as it likes; but to English eyes "woolen," "traveler," "labor," "defense," give to the pages an un-literary aspect which the book does not deserve, for it is well got up, and the pictures of old English fortified manor houses, landscapes, castles, and abbeys are of great interest.

Thiers' Moscow Expedition. Edited by HEREFORD B. GEORGE, M.A., Fellow of New College, Oxford. With six Maps. (Price 5s. Clarendon Press.)

This book, issued by the Clarendon Press, no doubt with a view to the Joint Board Examination, appears at an opportune moment, for the Russia of 1805 is the Russia of 1905. It consists of selections from Thiers' "History of the Consulate and the Empire," beginning with the battle of Borodino, and carrying the story on to the end of the

campaign. There is an excellent preface, setting forth clearly why Napoleon undertook the expedition and the causes of its failure, and containing some illuminating criticism of Thiers's treatment of his subject, its merits and defects. There are copious notes, interesting to the adult student, but far too numerous, we venture to say, for examination purposes. The time and energy, both of teacher and pupil, will inevitably be given to getting up these notes, and the pupils will be confused between what Thiers says and the real facts. It would, it seems to us, be better to let the learner enjoy and take in as much as possible of Thiers's literary style and spirit, the teacher impressing from time to time on him the fact that the book is "not sober history, but a prose epic." There are several good maps and diagrams, and a personal and geographical index. There are no portraits or illustrations—a serious defect—and the pages would have been the better for being broken up into paragraphs.

Ambidexterity. By JOHN JACKSON. With an Introduction by Major-General BADEN-POWELL. (Kegan Paul.)

This interesting volume is in two parts—the first theoretical, the second practical. The cause of right-handedness is a problem that has baffled the physiologists, and we seem no nearer a solution to-day than in the age of Hippocrates. On the other hand, it is hard to believe with the author that primitive man was ambidexterous and that dexterity is wholly due to custom and imitation. We may fully allow the cumulative force of transmitted habit, and yet we must postulate some momentum, however slight, in favour of the right hand at starting. Language offers an unquestionable testimony as to the antiquity of the preference. But Mr. Jackson's praxis is independent of his theory, and we can heartily back his advocacy of the teaching of ambidexterity (would not "bimanualism" be a happier term?) from infancy upwards. As to the advantages of simultaneous writing, in spite of the striking specimens given, we are not convinced. The book is a real contribution to pedagogics.

Advanced Course of Object Lessons in French. Book III.

By ALEC CRAN. (Price 1s. 6d. Nelson.)

Picture lessons would be a juster title. On each page on an average is an illustration, and the text consists of appropriate questions and answers. The book is well planned to add to the pupil's stock of common words, but we prefer a narrative followed by questions.

Messrs. Methuen's "Standard Library," the first volumes of which appeared on March 16, is a bold and spirited venture undertaken with the object of providing the public with sound texts of the classics of all nations. The price per volume is 6d. net or 1s. net bound in cloth. The print is very legible and the paper of fair quality, and, what in our eyes is a strong recommendation, light in weight. The only feature that suggests cheapness is the somewhat scant margins, and for the soundness of the text the general editor, Mr. Sidney Lee, is sufficient guarantee. Further, the texts will be complete. In a somewhat similar series issued some twenty years ago the student was incensed to discover that the work had been clipped without warning to come within the regulation number of pages. Besides the great writers like Shakespeare and Milton, we find in this first announcement many books that the poor student must have coveted—Massinger's "Plays," Edward Fitzgerald's "Translations of Calderon," Rossetti's "Translations of the 'Vita Nuova' and the Early Italian Poets," and the complete works of Sir Thomas Browne. Our gratitude to Messrs. Methuen may be expressed as a sense of favours to come, a hope that the series will be appreciated at its proper value by the public and eventually include all our great English classics that are out of copyright.

PRIVATE SCHOOLS ASSOCIATION, INCORPORATED.

THE Association held its annual meeting at the College of Preceptors on Friday and Saturday, March 3 and 4. Mr. A. Milne, the Hon. Secretary, in presenting the report of the Council, said that the past year had been an anxious one for principals of private schools, who had had to face the unfair competition of rate-aided schools. The deputation that waited on the Board of Education in July had received fair words, but little comfort. They were told that they must seek redress in legislation, but no hope of any amending Bill was held forward. Sir Henry Kimber, who was elected President for the ensuing year, urged the Association to hammer away persistently, and sit at the doors of the Board of Education till their just claims received attention.

At the Saturday meeting the question of joining the proposed Federal College of Secondary Teachers gave rise to an animated debate. Five resolutions were proposed by Mr. W. W. Kelland, the Hon. Treasurer, who explained fully the scheme as it at present stood, and the modifications that the Council of the P.S.A.I. demanded. The opposition was led by Dr. Reddie, of Abbotsholme, who showed himself no regard of persons, and railed against all the first-born of Egypt. The point he pressed was the over-representation of public

schools on the proposed Council. The Head Masters' Conference was a *fainéant* body that had no claim to representation at all. They stood for schools which were exceptional only in being behind the times; the private preserves of a small section of the community, and that not the most valuable. They should be merged in the Incorporated Association of Head Masters, a body that did do something. Both bodies were diametrically opposed to the interests of private schools. The public schools were the Established Church, and the private schools were the Nonconformists, of the twentieth century. The federation was a net spread for them by the modern Archbishop Laud. He hoped they would not walk into the spider's web, and allow themselves to be gobbled up. Nor had they anything to hope from the Board of Education, as he had discovered when he attended deputations. The Board was ruled by officials who were public-school men, and had no sympathy with venture schools, "a noble lord who might know something of coal mines, but knew nothing of education, and an ambitious young fellow who stood at his ear and prompted him." They must fight their own battles.

Miss Lawrence, of Roedean, answered Dr. Reddie in a calm and temperate speech which acted as a *quas ego*. Hitherto the policy of the Board of Education had been largely controlled by the elementary teachers, who were a solid phalanx. Nothing could be done which militated against the N.U.T. Secondary teachers must organize themselves in the same way if they were not to go to the wall. Some thought the House of Lords an effete institution, but to abolish it was not yet within the range of practical politics. So with the Head Masters' Conference. A scheme of the Brighton County Borough Council to co-ordinate all the secondary schools of the district was given as an instance of the need for a corporate body of secondary teachers that could speak with authority and prevent grievous wrong to private teachers.

Dr. Sibly said that he had welcomed the proposal when first started. The imminent danger that threatened education was an official bureaucracy, and the public schools might join hands with them in opposing it. But the conferences which he had since held with the executive of the scheme had made him suspicious that the interests of private schools would be sacrificed. He had inquired in vain what were the real objects of the College, but could get no answer. Later on he was told that one of the main planks was to urge upon Local Authorities a very much larger expenditure upon secondary schools. Then he had tried another tack, and put before the executive the policy of the P.S.A.I., asking whether it would be supported. Canon Bell had refused to answer, but Dr. Scott had said to him, "I cannot think how you can come here to support such a policy; it has been utterly repudiated."

Eventually Mr. Kelland's resolutions were carried with important amendments. "That the administration of the proposed College should be carried on by a Council consisting of an *equal* number of representatives of each confederate body, and of a number of members co-opted by the whole Council" was altered to "an agreed number." By another amendment it was resolved that educational qualifications for membership imposed by the proposed College shall not be accepted unless unanimously agreed upon by the representatives of the federated associations. Incidentally it was mentioned by the Secretary that from 20 to 25 per cent. of P.S.A.I. members were registered on Column B. As to the amount of annual payments to the College, Mr. Kelland stated that on the proposed terms they would be asked for £250 a year, an impossible sum. The utmost they could afford was £100; but the scale of subscriptions was to be reconsidered. Several members demurred to pledging themselves to pay even £100 a year for five years.

At the afternoon session the General Secretary, Mr. H. R. Beasley, opened a discussion on "Private Schools and Local Education Authorities." The subject had been entrusted to Mr. Millar Inglis, but, in consequence of that gentleman's temporary indisposition, he had undertaken at very short notice to fill his place. He began by defining a private school as one in which, not only the professional, but also the financial, responsibility was vested in a single head or principal. By this definition proprietary schools were excluded. He contrasted the different measure that had been meted out to private schools under the Acts of 1870 and 1902. Before 1902 the bulk of secondary education had been in private hands, but, while in 1870 the vested interests of voluntary schools had been fully safeguarded, in the Bill of 1902 what he might call their voluntary secondary schools had been ignored, and it was only by pressure brought to bear on individual members that he had succeeded in persuading Sir W. Anson to insert the clause requiring Local Authorities to have regard to existing schools. It was contended that this clause would prove a dead letter, as there was no machinery for enforcing it; but they had it on the highest legal authority that an action would lie against any Local Authority that could be proved to have set up an unnecessary secondary school. He hoped that this liability would be established by a test case. The encroachments of the Local Authorities were shown by a recent return of the Board of Education. They already controlled 4.1 per cent. of the secondary schools and 17 per cent. of the secondary scholars in the kingdom.

He sketched the proceedings of a model Education Authority.

First they would make a survey of the schools in their district. Then they would make overtures to the principals of private schools to see whether they would lend or adapt themselves to the general scheme. Many, doubtless, would decline; and he advised all private schools that wished to remain private to have nothing to do with Local Authorities. Then, and not till then, County Councils would be justified, if they found the supply inadequate, in setting up schools of their own.

What private schools might fairly ask of County Councils was the use of public laboratories and art rooms for their pupils, and the supply of peripatetic teachers where such were employed by Councils for public schools. Only they must seek out the Local Authorities and lay their case before them; it was not reasonable to expect the Local Authorities to take the first step. The action of various Counties and County Boroughs was criticized: Bedfordshire being held up as a model county, with Norfolk and Staffordshire at the opposite pole.

Lastly, the Board of Education was censured not only for refusing grants to private schools, but also for declining to lay down the conditions for the recognition of schools. Complaint was also made of the Board of Education inspections. To his knowledge, principals of private schools who were educationists to their finger-tips had been grossly insulted by Board inspectors; and, when complaint was made at headquarters, nothing had been done but to transfer the offending officers to other districts.

UNIVERSITIES AND SCHOOLS.

BEDFORD COLLEGE FOR WOMEN.

A special course of lectures on "The Teaching of Hygiene" will be given by Miss Alice Ravenhill, Fell. San. Inst. It is proposed that the lectures should be given in the Easter Term, beginning Thursday, May 18, at 4.30 p.m. Fee for the course, one guinea. For further information, apply to the Principal, Bedford College, York Place, Baker Street, W.

ST. MARY'S COLLEGE, PADDINGTON.

The first meeting of the Governors of St. Mary's College under the new Board of Education scheme will be held this month. The Hebdomadal Council of the University of Oxford have appointed the Right Hon. J. G. Talbot, M.P., as their representative; and the Council of the Senate of Cambridge University have appointed the Dean of Westminster, while Sir Melville Beachcroft remains the representative of the London County Council. Lady Frederick Cavendish and Mrs. Scharlieb, M.D., M.S., are among the co-opted members.

LONDON.

The Senate has conveyed its thanks to the Mercers' Company for a donation of £1,000 to the University for the promotion of the study of physiology at University College. Members of University College at the recent annual meeting approved the Bill for transferring the college to the University. £17,000 was lacking to the total of £200,000 which is a necessary condition of incorporation. The Fishmongers' Company has recently given £1,000. The above Bill, together with proposed amendments in the Statutes of the University, is undergoing consideration by the Standing Committee of Convocation, which also at its recent meeting appointed a sub-Committee to consider the practicality of establishing a University boat on the river and of promoting University athletics generally.

At the May meeting Convocation will have to elect members to fill the places of its retiring representatives on the Senate (who are re-eligible).

During the year 1904 twenty graduates of other Universities and persons qualified under Statute 113 came up for the Doctorate. Of these, four came from Oxford, four from Cambridge, and others from Bombay, Durham, Heidelberg, the Royal University of Ireland, Madras, Melbourne, Sydney, the Victoria University of Manchester, and the University of Wales.

The negotiations between the Universities of Oxford, Cambridge, and London for the mutual recognition of Matriculation and other Certificates have resulted in a definite agreement, by which, under certain conditions, the Cambridge Previous Examination and the Cambridge Senior Local Examination will be accepted in lieu of the London Matriculation; and the London Matriculation, whether taken in its ordinary form or in the form of the School Examination for the School-leaving Certificate, will exempt from the Previous. The negotiations are still in progress as between Oxford and London. The Senate has resolved to interpret retrospectively the agreements with Oxford and Cambridge when concluded.

History and Geography has been added to the optional subjects at Matriculation, but it cannot be offered by those who take either Modern History or Physical and General Geography. The joint paper will be set for the first time in June next.

The Boards of Studies have been constituted for 1905, and are to be seen in full in the *Gazette* of February 8.

Mr. W. Loring, M.A., has been appointed Warden of the Goldsmiths' College, New Cross, recently taken over by the University and to be opened as a training college for teachers. There are also vacancies for a Vice-Principal and Master of Method and a Vice-Principal and Mistress of Method: salary, £500 per annum.

Dr. Edwards has resigned his post as Secretary to the University Extension Registrar, having been appointed Inspector of Secondary Schools under the Board of Education. Mr. R. Roscoe, B.A., has been appointed in his place as Secretary, and Miss Jessie D. Whyte as Assistant Secretary, to the Extension Registrar.

OXFORD.

It was inevitable that great interest should be aroused at Oxford by the Greek vote at Cambridge in the beginning of March. The reformers were considerably disappointed, for, though the more cautious of them

Greek.

may have hardly expected victory, they no doubt thought the majority either way would be small. We do not propose to reopen the controversy now, of which enough has been heard for the present; but it is interesting to note that no sooner was the defeat sustained than it became apparent that some of the victors seemed anxious to show that they were not irreconcilable. There was talk of a compromise; of common action with Oxford; of a Science degree attainable without Greek; of some sort of attempt to get the thorny question settled by agreement. Anyhow, when Sir W. Anson at Oxford (before voting *non place!*) declares that it is the duty of the University to provide a degree course without Greek, and Prof. Butcher and others at Cambridge (also before voting *non place!*) profess that it is not the principle of the measure they object to, it is clear that the more intelligent opponents of the recent proposals do not (to apply current terms) wish to be mistaken for whole-hoggers. In short, the reformers, though defeated in both Universities, cannot begin to take their armour off; and, though some considerable discussion may be necessary before another step is made, the matter cannot rest where it is.

It may be remembered that last year the Senior Proctor published

The
Summer Term.

statistics of the falling off in attendance at lectures, and generally in serious work, which has become proverbial in the last half of the Summer Term.

The facts were eloquent, and were effectively presented, and there has arisen a practical proposal which has recently been much discussed, both orally in the colleges and in the pages of the *Oxford Magazine*. The idea may be briefly summarized. At present there are two main periods of festivity in the Summer Term—the Boats, which come just half way through; and the Commemoration (with its balls, lunches, concerts, dinners, picnics, and garden parties), which comes at the close, or strictly, just after the close, of the residential term. Human nature is such, it is argued, that this arrangement, though it has arisen quite naturally, tends to make anything like systematic work impossible to the average man during a period of about five weeks. It is therefore proposed to amalgamate the two "foci of relaxation" by fixing the races to begin in the eighth week, *i.e.*, at the end of term, and to hold the Encaenia on the last day of the Boats. It is argued that a very slight rearrangement of the summer examinations could easily be so made that the interests of work, examinees, boating men, the ordinary undergraduate, and the visitors should all be harmonized and considered. The chief objection urged is that of expense. The man who did not want to miss his college races—*i.e.*, the ordinary patriotic undergraduate—would be obliged to stay up into the ninth week, and pay Commemoration prices for his lodgings. In this dilemma many men would be forced to consider the cost, and go down, and would thus be unable either to row or to encourage their college crew; and the race-week would be the festival of the rich. There is said to be further a strong feeling in the town against an arrangement which would undoubtedly impair the profitable month of the tradesmen and lodging-house keepers. The first objection, it cannot be denied, is strong, and it remains to be seen whether it can be met by some modification of the proposal.

A good deal of interest is naturally aroused in Oxford by the

Head
Masterships.

vacancies which are, by a strange coincidence, imminent in the head mastership of four important schools at once. Eton, St. Paul's, the City of

London School, and Clifton College are all expecting the election in the next few weeks of a new head. The appointment of a head master of course makes a vacancy; and four simultaneous elections may cause ultimately a considerable "move up" in the profession. The question of lay or clerical head will be raised in a concentrated form; and that veteran fighter for a fair field and no favour, Mr. T. E. Page, will doubtless have something to say. Some pessimists also are murmuring

that so large a demand will be difficult to meet adequately. The rush of good men, they tell us, in recent years towards the Civil Service has sensibly affected the profession of teaching. There may be some truth in this; but we do not believe that the supply of good candidates is so easily exhausted. And, in any case, a batch of promotions, if the profession is really suffering from stagnation, is likely in the end to do good by attracting better material.

The production of "The Clouds" of Aristophanes by the Oxford Amateur Dramatic Society has been fully described and criticized in the papers of the first week of March; but it deserves a word of record in an educational paper. The play was certainly a great success. The parts were played with real spirit; and the skill and ingenuity of the staging deserved and obtained the highest praise. There was no orchestra (in the Greek sense); but the *parodos* of the chorus, as the gauze veils one after another were drawn up and the light grew and the finely grouped and beautifully dressed forms were shown on the steps at the back of the stage, with the Acropolis and Parthenon behind—all helped to produce a charming and striking effect. And, if there were some vivacious additions made to the stage business by exuberant youth, we feel sure that Aristophanes, had he been present (and understood), would have been the first to applaud.

Another interesting exhibition of Oxford historical portraits, covering the seventeenth century, will be opened before the beginning of next term. The catalogue will be shortly published.

Historical Portraits.

The following deaths have been announced:—The Rev. J. W. Routh, formerly of Magdalen College, rector of Tilehurst for fifty years, aged eighty-seven; Rev. W. J. Wise, formerly Fellow of St. John's, also aged eighty-seven.

Obituary.

The following announcements of degrees and appointments have appeared in the *Gazette*:—

Appointments, &c. Honorary Degrees: E. A. Copleston (St. John's), Bishop of Colombo, D. Litt.; Edward Arber, F.S.A.

Delegates: University Extension—Prof. Raleigh. Curators: Botanic Garden—W. W. Fowler (Lincoln), Rev. H. J. Bidder (St. John's), both reappointed; Taylorian—E. Armstrong (Queens); Sheldonian Theatre—J. L. Strachan Davidson (Balliol). Lecturer in Persian: Lt.-Col. Ranking, M.D., I.M.S. Special Lecturers: the Herbert Spencer Lecturer—Frederic Harrison; the Hibbert Lecturer—Dr. Farnell (Exeter), on "The Anthropological Study of Religion."

Prizes: Arnold Essay—R. W. Livingstone, Esq., Fellow of Corpus Christi.

It has also been announced, in a letter from the Warden of All Souls' to the Vice-Chancellor, that the College propose to repeat their gift of £600 to the Bodleian; and also, besides continuing to contribute £100 a year to the endowment of the Political Economy Professor, to supply a further endowment by electing him to a Fellowship.

CAMBRIDGE.

The great Greek question has been settled—or, at least, voted upon for the time being. Friday and Saturday, March 3 and 4, saw Cambridge swarm with non-residents.

Greek.

Particularly on the Friday afternoon the Senate House yard was black with country parsons voting *non placet*. Saturday brought us more laymen. But, as all the world knows, the graces were rejected by some 1,500 votes to 1,000. The figures varied slightly between grace and grace, but these round numbers give the general result.

What will happen next? I shall wait till I hear about it before I prophesy at all. For the present it is interesting to remark that in the last resort the University is governed largely by the country clergy. The lists of those who voted *placet* and *non placet* are to be published, and it would be instructive if some one had the patience to work out what proportion of each vote was clerical and what proportion of voters had taken Pass degrees or Third Classes. It seems highly likely that the *non placet*s would show a larger percentage both of clerics and poll-men. Dr. Fairbairn's recent letter to the *Times* about Oxford applies *mutatis mutandis* to Cambridge. Both as a governing body and as a Parliamentary elective body the Senate is an absurdity. Fortunately for the nation, however, it only has two representatives, who are generally chosen for it; and, fortunately for the University, it is only about once in ten years that a question reaches the Senate in its more rural branches. Generally it is the residents who decide questions.

Before I leave the subject of Greek it is worth while to remark that that language is more alive than its champions imagine. The former pupils of the Misses Fletcher, who for many years carried on a school at West Coombe House, Upper Hornsey Rise, have founded an annual prize in their old teacher's honour. This prize is to be given to the woman who, amongst those successful in both Latin and Greek in the Cambridge Higher Local, attains the highest place in Greek. If Greek

is to survive in England, as there is little reason to doubt it will, it will be thus—because people love it, not because it is a compulsory "cram" subject in entrance examinations for passmen.

The subjects for the Members' Prizes have been published. Last year the Latin one was "Erasmus"; the year before it was a purely literary question. The examiners this time have gone back to the old style

with a vengeance—"de C. Plini Caecilii Secundi vita indole genere scribendi commentatio." It will be interesting to see if this brings up more candidates. Generally they are few. One feels somehow that the age for writing Latin essays has passed, and that they really serve no great purpose. The prize has only been awarded eighteen times in thirty years, and the list of names, though respectable, is not at all striking. The best men seem generally to have something better to do.

On the other hand, the English Essay is more alive. This year the subject is "The Use of the Novel in English Literature for religious or political purposes"—a theme with far more throb and life about it than the "Commentatio de C. Plinio."

The Maccoll bequest is taking the form of a Lectureship on the Language or Literature of Spain or Portugal. The lecturer will be appointed once in four years, and give not fewer than five lectures. Though the first election will be in 1908, it is a pleasant coincidence that this foundation should date from the tercentenary of the publication of "Don Quixote."

At the same time we are trying to get the Burney foundation into a better and more serviceable form. It originally provided for a prize essay to be published "on some moral and metaphysical subject, on the existence, nature, and attributes of God, or on the truth and evidence of the Christian religion"—fine large subjects for Bachelors of Arts. The income of the fund has increased, and it is now proposed to relieve the essayist from publishing his ideas, and with the money thus rescued from the printer (or part of it), and the balance of the fund, to establish a studentship. The proposal is a wise one. Most of us would wish our prize essays unpublished if we could go back over our careers. The student will be required to publish "a thesis embodying the results of his study or research." This will at least keep him at work and tend to save the studentship from abuse.

Finally, we are trying again to secure something like order and procedure for the Lady Margaret Professorship elections. Hitherto every graduate in Divinity could vote for any other—or even himself, and the results have not always been happy. It is now proposed that there shall be definite names before this strange electorate, enough to give them a choice and to secure that the professorship shall not necessarily go to the most successful electioneer.

The Local Examinations and Lectures Syndicate are wanting a new

&c.

Assistant Secretary for the Lectures. He will have to be in Cambridge for some forty-two weeks in the year, and will probably have two or three hours' work a day. The salary is £150. Names of graduates who desire to be candidates should be sent to the Rev. D. H. S. Cranage, Syndicate Buildings, by May 8.

The Day Training College report shows that forty-seven students were at work there in June, 1904, nine taking Honours in Triposes. Quite a number hold exhibitions, sizarships, and subsizarships in their colleges. There are now fifty-five primary and nine secondary students.

A schedule has been issued for the special examination in Geography and Part I. of the examination for the Diploma in Geography. The six subjects are: (1) Physical Geography, (2) Historical and Political Geography, (3) Economic and Commercial Geography, (4) Cartography, (5) History of Geographical Discovery, (6) Elements of Ethnology. Under (2), (3), and (5) special periods are set.

Appointments: A. W. Hill, M.A. (King's), University Lecturer in Botany; C. Shearer (Trinity), to the University table at the Zoological Station, Naples; W. Mitchell, B.A. (St. Catharine's), Fellowship at Christ's College; Sir F. E. Younghusband, K.C.I.E., Rede Lecturer, 1905; Hajji Mirza Abd'ul-Husayn Khan, University Teacher of Persian; T. S. P. Strangeways, M.A. (St. John's), Huddersfield Lecturer in Special Pathology; R. P. Gregory, M.A. (St. John's), Senior Demonstrator in Botany; O. L. Richmond, B.A., Fellowship, King's College.

Scholarships, Prizes, &c.: R. A. Furness (King's), Sir William Browne's Medal for a Greek Ode; R. Meldrum (St. John's), Browne Medal for Latin Ode; J. Fraser (Trinity), Browne Medal for Greek Epigram; G. C. Brooke (Corpus), Browne Medal for Latin Epigram; A. F. Scholfield (King's), Powis Medal for Latin Hexameters; E. G. Selwyn (King's), Porson Prize; A. C. O. Morgan (Trinity), Chancellor's Medal for English Verse; E. A. Benians, B.A. (St. John's), Allen Scholarship.

MANCHESTER.

The quotation from Plato which was selected by Prof. Alexander for the Withers Memorial is the following:—*Εἰς ὁμοιότητά τε καὶ φιλίαν καὶ εὐφροσύνην τῷ καλῷ λόγῳ ἄγων.*

Girls' High School. The most interesting event of the month from an educational point of view has been the opening of the new Biological Laboratory and School of Domestic Economy at the Girls' High School. This function took place

in the presence of a large gathering on March 3, the ceremony being performed by the Lord Mayor. The High School for Girls has long possessed an admirable chemical laboratory and lecture theatre, and steps have recently been taken to provide the most modern equipment for the teaching of biology, including advanced histological work. The biological laboratory is probably the most complete of its kind in the girls' schools of the country, and we hope next month to give some description of it. During the last seven years the numbers of the school have risen steadily from 330 to 440, and an increasingly large number now stay on to take the University Matriculation Examination or to do advanced work.

Some changes are about to take place in connexion with the two high schools in North Manchester and at Pendleton, which are under the same Board of Governors. After twenty years' work in Pendleton, Miss Butcher now retires from the head mistressship of that school, which was opened in 1885 as a branch of the Dover Street Schools. Three years later it became the Pendleton High School for Girls, with eighty pupils. In a few years more the numbers had risen to over a hundred and thirty, near which figure they have remained. Miss Butcher has been the Head Mistress of the school for the whole period, and she is now succeeded by Miss Rosa Patterson, M.A., who is at present Head Mistress of the North Manchester School. It is not the intention of the governors to appoint a successor to Miss Patterson in North Manchester, but facilities will be offered to parents who wish to send their girls to the Pendleton school. Miss Patterson was appointed to the North Manchester school less than two years ago, and, under her management, the numbers of the school have risen from about thirty-five to sixty.

An interesting gathering took place on March 17 at the Whalley Range High School for Girls, when a public welcome was accorded to Miss Florence Field, who recently became Head Mistress of the school.

Grammar School. At the Grammar School a strong committee of masters and boys have taken in hand the reorganization and enlargement of the school museum. The school is losing the services of an esteemed governor in the person of Mr. W. B. Worthington, and of an invaluable member of the staff in the person of Mr. R. D. Hodgson, M.A., who, after ten years' service at the school, has received an important appointment in London. At the conclusion of Archdeacon Wilson's lecture on March 17 on "Stars Visible and Invisible" the boys showed by their cheers how much they have appreciated the Archdeacon's kindness on so many occasions, and how warmly they endorsed Mr. Paton's expression of good wishes for the future.

Education Committee. At the monthly meeting of the Manchester Education Committee an animated discussion took place on the growth in expenditure for educational purposes. A firm stand was, however, made by the Lord Mayor and others, who maintained that it was impossible now to adopt a retrograde policy. The Special Committee for Domestic Economy and Cookery presented the report already referred to. They recommend the establishment of a centre for the training of women as teachers of the domestic arts, and provision for the training of girls from the elementary and evening continuation schools. Another matter of interest discussed was the case of the fifteen or twenty dangerous epileptic children in Manchester schools, for whom there is at present no special provision, and for whom the Committee are not empowered to make a special grant.

The question of juvenile smoking was again before the Salford Committee, and the Elementary Education Committee was empowered to forward a memorial on the subject to the House of Commons in support of Dr. Macnamara's Bill. The Independent Labour Party have requested the Committee to establish cheap restaurants in connexion with the elementary schools. Sir John Gorst's motion has brought the question of free meals for school-children to the front in Manchester once more. In an interesting letter, Mr. E. J. Broadfield, late Vice-Chairman of the School Board, and Treasurer of the Free Meals Fund, points out that, owing to the liberality of the contributions to the fund, "during the last twenty years, there has been no difficulty in dealing with the problem of feeding destitute children at least once a day, without aid from the municipality or the Poor Law Guardians."

The University. At the University a conference of representatives of the University on Education Committees and governing bodies of schools was recently held, with a view to strengthen the ties between the various institutions. Mr. G. C. Simpson, B.Sc., has been appointed Lecturer in Meteorology and Assistant Lecturer in Physics. A Chair of Celtic has been founded, with Prof. Strachan as the Professor of that language. On the occasion of the presentation of congratulatory addresses to Manuel Garcia on March 17 the University was represented by Prof. Stirling, Dr. Killigan, and Dr. Moritz. The new Secretary of the Extension Com-

mittee has issued the general regulations and list of Extension lectures for the year. The list covers a very wide range of subjects. A Fellowship has been established by the Vulcan Boiler and General Insurance Company for study and research in engineering.

The Women's Union. The Women's Union celebrated the twenty-first anniversary of the admission of women to the University on March 10 by a reception in the Whitworth Hall, at which speeches were made by the Vice-Chancellor and some of the women graduates. An interesting letter from Prof. Wilkins contained the following passage:—"I can only say that, having worked for twenty years under the much-dreaded system of co-education, I have seen nothing whatever to lead me to regret my modest share in preparing for and introducing it."

Treasury Grant. As reported last month, the Treasury grant to the University of Manchester has been raised from £3,500 to £6,000, this being the highest grant to any provincial University. Among the schemes prepared by the various colleges, suggesting a plan for the expenditure of the surplus funds, a Manchester scheme appears asking for £700 for library, chemical laboratory, and museum. A Special Committee has been considering the regulations issued by the Army Council, enabling University candidates to obtain commissions in the Army on the nomination of their Universities; and some alterations have been suggested.

A new undergraduates' magazine has appeared, entitled *Varsity Opinion*. The report of the Commercial Faculty does not reveal any facts not already reported. Among the many courses of lectures in progress few have attracted greater interest than Prof. Sadler's course on "The Organization of Secondary Schools for Boys and Girls," in which he is dealing in detail with questions of organization, cost, and curriculum.

WALES.

Welsh University Affairs. The question of the management of the University of Wales has now come to a head. From a business point of view, there can be no doubt that there is urgent need of reorganization. There are three offices doing work which ought to be concentrated in one. There is the Registrar's office, now permanently established in Cardiff; there is the Vice-Chancellor's office, which is peripatetic; and there is the Senior Deputy-Chancellor's office, now located at Newcastle-on-Tyne. The position of Deputy-Chancellor was intended to be to a large extent ornamental, but under the present conditions Sir Isambard Owen does a vast amount of routine work with which he ought never to have been troubled. For example, it is said that he actually revises every proof of the Calendar of the University. The situation was awkward when the Senior Deputy-Chancellor was living in London; now that he has gone to the borders of Scotland, and is the working head of a college of another University, it is obvious that the present state of things cannot continue. Nor is the state of things in connexion with the Vice-Chancellorship any more satisfactory. The principals of the three constituent colleges act in turn: during their two years' tenure of office, so much work is thrown upon them that they have perforce to neglect to a more or less serious extent the direction of their own college affairs, or else overwork themselves dangerously. It is rumoured that Principal Reichel feels so strongly on this point that he intends to refuse to act as Vice-Chancellor from September, 1905, to September, 1907. What is wanted is a working head of the University, to relieve the Senior Deputy Chancellor and the Vice-Chancellor of the great burdens now cast upon them, and to be responsible to the Senate and Court for the working of the University organization. There was once a prospect of securing Sir Isambard Owen's services in this capacity. This would be the best solution of the question both from a business and a sentimental point of view, for, as a matter of sentiment, there is no doubt that the fact that both the Senior and Junior Deputy Chancellors are officials of other Universities is galling to many friends of the University of Wales. Unfortunately, however, this solution would appear to be now very improbable.

The discussion which has been going on in the Welsh press since Sir Marchant Williams gave publicity to what had been spiritedly debated for a long time in private is hardly satisfactory to serious students of educational problems. It would appear that many Welsh publicists, whilst much interested in education, have but dim ideas of the actual working of educational organizations outside the Principality. Even the Warden of the Guild of Graduates, for example, regards it as "one of the many peculiarities of the University of Wales" that the college professors act as internal examiners in the degree examinations, and wishes to do away with it. This and other expressions of opinion elicited by the controversy "give one furiously to think."

Another month has passed and no Welsh Education Authority has been declared in default. There are rumours that Bishop Hedley and Mr. Lloyd-George are on the point of effecting a compromise as regards the Roman Catholic school at Barry. Merionethshire seems to be spoiling for a

fight. In the event of that county being declared in default, it is said that quite a different plan of campaign from what Mr. Lloyd-George originally proclaimed will be adopted. The latest report is that the Education Committee will not resign, as was at first intended, but will carry on the schools in the same way as before. If the Board of Education withholds the usual grants, it will be sued for them in a court of law. The Merionethshire stalwarts maintain that the non-provided schools have not yet complied with the Act, and mean to contest stubbornly the legality of any application of the Default Act to them. At present, therefore, it looks as if a legal struggle will be substituted for the dramatic *dénouement* which most people have been expecting.

There is much talk of establishing new secondary schools in Wales.

New Secondary Schools.

North Wales is so well supplied with county schools that there is no likelihood of the establishment of any more. It is true that Colwyn Bay strove hard to convert its higher-grade into a secondary school; but, in view of the close proximity of the Abergele County School, the scene of the apotheosis of Caractacus, the Denbighshire Education Committee very wisely refused to accede to the wishes of that "pushful" community. In South Wales, on the other hand, it seems certain that some new secondary schools will be opened. The Rhondda Education Committee desired the Glamorgan Education Committee to establish as many as three secondary schools in the Rhondda, in addition to the Porth County School. This ridiculous project was defeated, but arrangements have been made for the conversion of the higher-grade school at Pentre into a secondary school, so that the Rhondda will have two secondary schools. Other schools also are being agitated for in other parts of Glamorgan, and it seems probable that the movement will be successful in one or two places. The Glamorgan Intermediate Education scheme is under revision, and it is believed that the new schools will be brought under the provisions of the Intermediate Education Act. In Carmarthenshire another attempt is being made to induce the Education Committee to agree to the establishment of a new county school in the Aman Valley, but it is not likely to be successful. A far more important question than the establishment of new secondary schools is the adequate financing of the existing ones, but this problem has not been faced yet by any Authority.

St. David's Day was this year celebrated on a larger scale than ever in the schools and colleges of Wales. The Welsh Language Society arranged a notable celebration at Llanelly. In the afternoon all the pupils of the elementary schools of the town were assembled together in the Market Hall to hear an address on the patron saint of Wales and to sing Welsh airs to the accompaniment of an orchestra of about a hundred boys and girls. The proceedings were most impressive, and the example of the tinplate town will doubtless be largely followed in future years.

St. David's Day.

The Aberdare Education Committee, which last month passed a resolution forbidding the assistant teacher to use the cane, have "climbed down," after an unseemly wrangle which provoked many commentators in the Welsh press to advocate an extension rather than a curtailment of the use of the stick, and the assistants have withdrawn their resignations. The Glamorgan Education Committee have since then passed a resolution similar to the Aberdare resolution, and more trouble is anticipated.

The Welsh County Schools' Association will hold its annual general meeting at Shrewsbury on April 7 and 8. There will be many conferences in Easter week, among them being the N.U.T. conference at Llandudno, for which the elementary teachers of Wales have made great preparations; the Guild of Graduates meeting at Bangor; reunions of the old students of the three University colleges, &c.

Coming Conferences.

The new Scotch Education Bill is, in its main lines, identical with the Bill of last year; but considerable changes have been made in detail, and practically all of these changes are distinct improvements. The constitution of the Provincial Councils has been slightly altered, and it is now evident that they are to be identical with the new Committees for the training of teachers, established under the Minute of the Department which was mentioned in last month's "Notes." The training of teachers is definitely entrusted to them, and their position is considerably strengthened by the provision not merely that any Provincial Council "may make a representation to the Department with reference to any matter affecting the educational interests of its province," but that "before deciding thereon the Department shall give due consideration to such representation." It is also provided that "any Provincial Councils may from time to time join in appointing out of their respective bodies a Joint Committee for the purpose of deliberation and consultation as to matters relating to education."

The New Bill.

Another important modification, which should go far to meet the views of those who prefer the county to the district area for School Boards, is the giving of power to the Secretary for Scotland to combine two or more districts into one School Board area or to divide counties and districts into smaller School Board areas. Again, in last year's Bill the whole of the equivalent and other grants were combined into a single fund, which was to be administered solely by the Department, mainly for the purposes of secondary and higher education. The new Bill allows the Town and County Councils to retain a certain amount of this money for their own purposes, and it also wisely provides that the spending of £100,000 a year out of the fund is to be entrusted to the School Boards, who are, of course, to use it solely for higher education. The clauses dealing with the co-ordination of higher education and its development in the various districts have also been modified so as to secure that there shall be no "waste of educational resources." This ought to prevent any misguided policy of starving or ignoring endowed schools, and it will probably facilitate the inclusion of such schools in the general system. On the other hand, while in last year's Bill the governors of any endowed school were empowered to hand over their endowments to a School Board, this power is now given only in cases where the endowment does not amount to more than £1,000 a year. Provision is further made in the new Bill for the sanitary inspection of schools and for the reporting of cases of infectious disease. School Boards are also empowered to provide school books, &c.; to convey crippled children to and from school, and to defray "the cost of lodging pupils in convenient proximity to a school," provided the cost is not greater than the amount which might have been spent on travelling expenses. The rating clauses have also been considerably modified, so as to meet the objections that were raised in the discussion in the House of Commons last year. In the interest of Scottish education it is fervently to be hoped that the Bill will be passed this Session.

In connexion with the Department's Minute on the training of teachers the question of religious instruction has been raised in the House of Lords by Lord Balfour of Burleigh, and the Disestablishment Council seems ready to fight against the Minute from the extreme opposite standpoint. But the general feeling in Scotland is that the Minute proposes a perfectly equitable arrangement, and there will be much disappointment if its passing is endangered by the few extremists on either side.

Mr. W. M. Gloag, B.A., advocate, a son of Lord Kincairney, has been appointed by the Crown to the Professorship of Law in the University of Glasgow, vacant by the resignation of Mr. Alexander Moody Stuart.

Edinburgh University Court has drafted ordinances for a degree in Veterinary Medicine and Surgery, and Glasgow University Court is about to draft an ordinance for the degree of B.Sc. in Pharmacy.

A committee of representatives of the General Councils of the Universities has issued a number of recommendations regarding the Bursary competitions. These recommendations are mainly to the effect that the Bursary competitions should be dissociated from the Preliminary Examinations and held in summer, soon after the Leaving Certificate Examinations, and that the subjects of examination should be divided into groups, representing Classics, Modern Languages, Mathematics, Science, and English—each group to consist of two subjects only; separate bursaries being allocated to each group. These recommendations will be considered by the General Councils at their meetings in April.

Bursaries.

The St. Andrews University Court has appointed a committee to arrange for the celebration, about the end of next winter session, of the four hundredth anniversary of the birth of George Buchanan, the tutor of James VI., who was a student of the University and was afterwards Principal of St. Leonard's College. In connexion with this commemoration, Dr. J. P. Steele Hutton, of Florence, has offered a prize of 100 guineas for the best essay on "Sixteenth Century Humanism, as illustrated by the Life and Work of George Buchanan," open to competition from the four Scottish Universities; a prize of 20 guineas for the best translation by a St. Andrews student of Buchanan's "Baptistes," or "Jephthes"; and other prizes for translations by St. Andrews students of selected passages from Buchanan's works.

In memory of the late Archibald Forbes, the war correspondent, a gold medal has been presented to the University of Aberdeen, to be awarded in connexion with the class of History.

Sir Henry Craik, late secretary of the Scotch Education Department, was entertained to dinner in Edinburgh on March 4 by representatives of the chief educational institutions in Scotland. The Earl of Elgin, Chairman of the Carnegie Trust, presided, and warm appreciation of Sir Henry Craik's services to education in Scotland was expressed by the various speakers.

Miss Helen Rutherford, M.A., has been appointed mistress of method

(Continued on page 276.)

OXFORD UNIVERSITY PRESS.

XENOPHON'S ANABASIS. Books

I-IV. Reissue in uniform cloth binding at 1s. 6d. each. Each with Introduction, Notes, and a full Vocabulary to the whole of the *Anabasis*. BOOKS I, III, and IV edited by J. MARSHALL; BOOK II by C. S. JERRAM. Vocabulary by J. MARSHALL.

Educational Times.—"Introductions and notes adequate and careful. Excellent."

HORACE. With a Commentary by EDWARD C. WICKHAM, D.D.

Vol. I.—The Odes, Carmen Saeculare, and Epodes. New Edition. 6s.

Educational Times.—"Some months back we noticed the second volume of Dean Wickham's most careful and scholarly work. While following the lines of the school edition of 1891, the present edition brings the notes into substantial harmony with the later octavo edition. The general introduction deals adequately with the text (MSS., scholiasts, and editions), and summarizes what is known of Horace from his own works or from other sources. The notes are very full and helpful, and suggestive even if not in all cases convincing. An appendix deals with metres and other special matters. Altogether an excellent edition, beautifully got up and convenient in form."

Vol. II.—The Satires, Epistles, and De Arte Poetica. 6s.

Educational Times.—"Scholarly, elaborate, and helpful; and the print and get-up are very tasteful and attractive."

LIVY. Book VI. With Introduction and Notes by A. R. CLUER, B.A. Revised by P. E. MATHESON, M.A. Separate issue, extra fcap. 8vo, cloth, 2s.

Educational Times.—"The notes are discriminating and careful."

School World.—"We would specially praise the 'Excursus on Livy's Language and Style,' a most useful addition. The notes are satisfactory."

EXERCISES IN LATIN PROSE.

By G. G. RAMSAY, LL.D., Litt.D. Extra fcap. 8vo, cloth.

Part I.—Lower Grade. Price 1s. 6d.

Part II.—Higher Grade. Price 1s. 6d.

Part III.—Syntax and Appendix. Price 2s. 6d.

Education.—"The exercises are in themselves interesting, and recapitulatory exercises at suitable stages add largely to the value of the books. Valuable, too, are certain well-selected passages for translation into continuous prose. . . . The vocabulary given in each of the first two parts is full and serviceable. In point of cost, as well as utility, no better manuals could be desired."

Educational Times.—"Admirable manuals, constructed with notable care and judgement."

GRADUATED LESSONS ON THE OLD TESTAMENT.

By the Rev. U. Z. RULE. Edited by the Rev. LL. J. M. BEBB.

In Three Volumes, extra fcap. 8vo, with Maps in each volume. The three volumes can be bought separately, price 1s. 6d. each volume in paper boards and cloth back; 1s. 9d. each volume in cloth. Specimen Copies may be had by Schoolmasters and School Teachers on special terms, on application to Mr. Frowde, Amen Corner, E.C.

From the Rev. H. B. GRAY, D.D., Warden of Bradfield College, Berks:—"In my judgement Mr. Rule's Graduated Lessons will be very valuable in the hands of teachers and their pupils, and equally useful in the hands of independent students. The historical statements are concise and clear. The explanatory footnotes are uniformly good, brief, and accurate."

From Miss L. H. SOULSBY:—"The book seems quite unusually well adapted to give a broad outline of the Bible, showing its chief parts in true proportion and right relations."

BURNS.—SELECTED POEMS. By J. LOGIE ROBERTSON, M.A. New Impression. Extra fcap. 8vo, cloth, 3s. 6d.

OXFORD MODERN FRENCH SERIES.

Edited by LEON DELBOS, M.A.

Crown 8vo, cloth.

FOUR NEW VOLUMES.

UNE HAINE A BORD. By DE LA LANDELLE. Edited by R. E. A. CHESSEX. 256 pages, 3s.

LES NORMANDS EN ANGLETERRE ET EN FRANCE. By THIERRY. Edited by A. H. SMITH. 160 pages, 2s. 6d.

Dundee Advertiser.—"Schoolboys will be interested in spite of themselves."

LE SERMENT. By JULES DAVID. Edited by CÉCILE HUGON. 96 pages, 1s. 6d.

Tablet.—"An exciting story which should help to attract by its inherent interest."

VOYAGE EN ESPAGNE. By GAUTIER. Edited by GERALD GOODRIDGE. With a Map. 213 pages, 2s. 6d.

Sheffield Independent.—"This masterpiece, one of the most delightful books of travel in any language, is eminently suited for such a series as this, alike by reason of the charm of its style, its picturesqueness, and its incessant fascinating interest. The volumes published in the 'Oxford Modern French Series' are calculated to induce pupils to study French literature for its own sake, not as a task, but as a pleasure; and of none of these volumes is this statement more true than of Gautier's immortal narrative of his Spanish journey."

Other Volumes in this Series already published are—LAMARTINE'S "Deux Héroïnes de la Révolution Française," 2s. 6d.; BALZAC'S "La Vendetta" and "Pierre Grassou," 2s.; VICTOR HUGO'S "Bug-Jargal," 2s.; SANDEAU'S "Mademoiselle de la Seiglière," 2s. 6d.; CHATEAUBRIAND'S "Mémoires d'Outre-Tombe," 2s. 6d.; KARR'S "Voyage autour de mon jardin," 2s.; GOZLAN'S "Le Château de Vaux," 1s. 6d.; "Extraits de Voyages d'Alexis de Tocqueville," 2s.

ARISTOTLE'S POLITICS.

Translated by BENJAMIN JOWETT. With Introduction, Analysis, and Index by H. W. C. DAVIS, M.A. Extra fcap. 8vo, cloth, 3s. 6d. net.

CHART OF THE RULES OF HARMONY. By A. SOMERVELL. Crown 4to, on a card, 1s. net.

CHART OF THE RULES OF COUNTERPOINT. By the same Author. Crown 4to, on a card, 1s. net.

LECTURES ON THE LOGIC OF ARITHMETIC. By M. E. BOOLE. Crown 8vo, cloth, 2s.; or interleaved with writing paper, 3s.

THE PREPARATION OF THE CHILD FOR SCIENCE. By M. E. BOOLE. Crown 8vo, cloth, 2s.

and warden of the women students under the Local Committee for the training of teachers in connexion with Glasgow University.

IRELAND.

The institution by the Board of Trinity College, Dublin, of scholarships tenable in the college to be awarded to the foremost exhibitors in the Middle and Senior Intermediate Grades on the results of the Intermediate Examinations was supported by Sir John Nutting, who gave £5,000 in order to extend the plans of the Board. It was a condition that no pupils from schools receiving any endowment other than the school grant from the Intermediate were eligible for the scholarships—a rule which would throw most of them into the hands of Roman Catholic schools, as the Protestant schools have generally some small endowment—usually very small—from other sources. Sir John Nutting added an offer to give an additional £5,000 towards the erection of a Roman Catholic church within the wall of Trinity College.

These proposals were met by a fierce denunciation from the Catholic Bishops of any parents or students who should accept them. They were stigmatized as proselytizing bribes, and the various advances recently made by Trinity College were rejected in the most insulting and intemperate language. The resolutions of the Bishops were read in all the churches on an appointed Sunday in February.

It is now stated that the Bishops intend to found similar Intermediate Entrance Scholarships in the Royal University as a counter-attraction to the scheme of the Board of Trinity College. But the latter are meeting with opposition from others besides the Roman Catholic Bishops. Trinity College has also announced that boys who have passed in certain subjects in the Middle or Senior Grade will be considered as matriculated in T.C.D. The Protestant Schoolmasters' Association have strongly protested against both this and the scholarship scheme as offering inducements to boys to leave school after passing the Middle Grade, which, with able pupils, often occurs at the age of fifteen or sixteen. They object even to the Senior Grade Scholarships, and point out that taking away boys from school at an early age will not only be injurious to the students themselves and to the schools, but eventually to the University, as it will inevitably lead to a lowering of the standard in both the teaching and examinations.

The Irish Branch of the Teachers' Guild and the Central Association of Women Graduates and Candidate Graduates have also memorialized the Board to exclude students of the Middle Grade from their scheme. It is understood, however, that the Board will not yield to these petitioners and will carry out their proposals.

Trinity College, having entered on the path of reform, seems likely to go far. The Board have appointed a Committee consisting of two Senior Fellows, two Junior Fellows, and two professors to consider what reforms are desirable in the curriculum and examinations, including the most important of all, the examination for Fellowship. No subject more seriously presses for reform than this. The examination is the most difficult in existence, and so planned as to exhaust physical and mental strength, while doing nothing to draw forth or test originality and independent research or scholarship. It proves disastrous to many young men, who succumb under the strain, while in those who succeed it seems to destroy the best powers. The extraordinary absence of intellectual distinction and original production, either literary or scientific, among the younger Junior Fellows must find its cause in the whole curriculum of which they are the result. It is to be hoped that, while lessening the difficulty of the present examination for Fellowship, encouragement will be given to original research and production, not only in this examination, but also in those for Honour degrees.

An equally serious question is the better securing of able specialists for the professorships. Some of these are poorly paid, and for this reason, perhaps, they are usually given to the Fellows, many of whom have shown no special ability—still, have done valuable original work—in the subjects they undertake. The decline in the distinction and ability of both the Fellows and professors of late years is one of the most serious features in the present state of the college. But not less do its constitution and finances need to be put on a sounder basis. Whether the funds be adequate or not, no one can tell, for the accounts are not audited, nor is it possible to ascertain how they are expended, except that it is known that the Senior Fellows have salaries averaging about £1,500 a year, and many of the Junior Fellows incomes much higher than those received for similar work in other Universities. In the government, the concentration of all direction and authority in the hands of seven men, averaging more than seventy years of age, is productive of innumerable evils.

The establishment of training for secondary teachers in Ireland seems at last likely to be secured. A Committee has been formed in Trinity College, under the direction of Mr. E. P. Culverwell, F.T.C.D., to arrange for courses of lectures and practical training in preparation for the certificates and diplomas in education established

in the College some years ago. Lectures by Father Finlay and Prof. Maginnis, with some practical work, are being given, also, in University College, Stephen's Green, and are attended by some thirty students.

The Irish Association of Women Graduates, which has been actively promoting training in Ireland, has approached the Presidents of the Queen's Colleges on the subject, and deputations from the local branches of the Association have had interviews with Dr. Hamilton (Queen's College, Belfast) and Dr. Windle (Queen's College, Cork). The Council of Alexandra College also have in contemplation the establishment of a Training Department within the College. Some of these schemes will probably come into action next autumn.

The Association of Women Graduates recently held their Annual Meeting in the Royal University. In their Report for 1904 the correspondence between them and the authorities of University College, Stephen's Green, on the subject of opening the teaching given by the Fellows of the Royal University in the College to women students was published. While the College has the services of fifteen Fellows of the R.U.I., it excludes women students from attending their lectures, thus making it impossible for those not residing in Belfast, Cork, or Galway to receive any teaching from the Fellows of their University, and, in the case of Catholic women, debarring them wholly from University teaching if they obey the prohibition of the Church against their going to Trinity or the Queen's Colleges. A few public lectures only in University College are open to them. The President put forward want of accommodation and of funds as the reason of their exclusion; but, since women would, as in other colleges, attend the same classes as the other students, and would pay fees, this reason seems frivolous. It is extraordinary that, in the midst of the present agitation, the Catholic party should adopt so short-sighted a policy. The Association of Women Graduates have laid their case before the Chief Secretary for Ireland.

The position of assistant teachers in Ireland, the lowness of their salaries, and the neglect of the Intermediate Board either to insist on qualified teachers or to procure for them adequate remuneration is being brought forward by the Irish Association of Women Graduates and the Association of Intermediate and University Teachers. The latter had recently an interview with the Assistant Commissioners, in which they made several suggestions for the improvement of the position of assistant teachers. A fortnight ago the Association of Women Graduates memorialized the Intermediate Board to reserve the posts of centre superintendents exclusively for assistant teachers as conferring some slight pecuniary advantage on some of their number.

The number of candidates who have given notice of their intention to present for examination next June is the largest since the establishment of the Intermediate system. 7,412 boys and 2,858 girls, making a total of 10,270 students, have given such notice. The corresponding numbers last year were 6,717 boys and 2,449 girls—total, 9,166 students.

There appears to be little hope of a solution of the difficulty between the Treasury and the Board in regard to the introduction of the scheme of inspection submitted by the latter. It seems to turn on the fact that the Treasury is not satisfied as to how the additional expenditure involved in inspection is to be met by reductions in the expenses of the examinations. Through this quite subordinate question the scheme of reform of the Commissioners is paralyzed, and any hope of making the Intermediate something better than a mere system of examination and payment by results is frustrated.

Last year the income of the Board was nearly £152,000, of which over £88,000 was spent on administration, school grants, examinations, exhibitions, &c., and over £12,000 on advances to schools for appliances for science teaching, while £50,000 was transferred to capital account.

SCHOOLS.

BEDFORD GRAMMAR SCHOOL.—Our numbers keep fairly stationary—about 870—and this in spite of the recent increase of fees. Two University distinctions at Oxford have fallen to old pupils—the Craven Scholarship to C. L. Peel and the Senior Mathematical Scholarship to G. S. Le Beau; while from the school D. Peel and W. Cleary have been elected, one to the second classical scholarship at Balliol, and the other to the first major classical scholarship at Trinity College, Cambridge. R. Rankin has also been elected to an exhibition at Queens' College, Cambridge. On the military side G. G. Keene has passed into Woolwich, and P. Boyce, V. Sherwood Smith, L. Cowell, and H. V. Yule into Sandhurst. Lectures in hall on Saturday evenings have become this winter a distinct feature of school life. With the exception of one by Mr. Frank Bullen, of cachalot fame, they have been illustrative of English history. The Head Master (Mr. J. E. King) began the course with a description of Roman Britain; this was followed by an account of the Battle of Hastings, from Prof. Tout, of

(Continued on page 273.)

TALKS WITH A BOY.

THE FIRST YEAR OF RESPONSIBILITY. By MAYNARD BUTLER. With an Introduction by the MASTER OF TRINITY COLLEGE, CAMBRIDGE. 18mo, 1s.; cloth, 2s.

"The appeal to the best that is in a boy's nature Mr. Butler has made; and we are glad that these notes, written originally for his own boy, should now be made accessible to others."—*Inquirer*.

"All parents, conscious of the trials of the youth, would do well to place it in the hands of lads."—*Glasgow Herald*.

"It will do a lot of good if boys can be got to read it."—*Education*.

"I cordially wish it God-speed."—The MASTER OF TRINITY.

Manchester University, who placed on the screen the whole series of pictures from the Bayeux tapestry. "Camps and Castles" and "The Wars of the Middle Ages" have been treated in the subsequent lectures by Mr. J. E. Morris, a member of the staff and a recognized authority on military history. The school corps has undergone some changes. It has been remodelled as a cadet corps, with the Head Master as major. A new miniature shooting range is in contemplation within the school grounds, in order to give more opportunity for practice and to encourage shooting in the school.

CHARTERHOUSE.—The following are distinctions outside the school:—A. C. P. Mackworth, demyship at Magdalen College, Oxford; A. L. Pearce Gould, scholarship at Christ Church, Oxford; J. D. Thomson, scholarship at Trinity College, Oxford; H. E. L. Porter, scholarship at Corpus Christi College, Oxford; H. le G. Kensington, scholarship at Pembroke College, Cambridge; C. F. Taylor, scholarship at Emmanuel College, Cambridge; A. G. Evans and A. C. Roxburgh, science exhibitions, Trinity College, Cambridge; T. B. Heaton, science exhibition, Christ Church, Oxford; G. M. Reid, exhibition, Pembroke College, Cambridge; C. W. Dible, history scholarship, Corpus Christi College, Oxford; D. G. Bles, postmastership, Merton College, Oxford. The school has, for the first time in its history, been inspected by the Oxford and Cambridge Schools Examination Board.

CLIFTON COLLEGE.—Mr. J. F. Dobson, who has for the last three years been taking the highest classical work in the school, and was also in command of the Engineer Corps, has left us this term to take up a classical lectureship at Birmingham University. Mr. Shawyer has come to take the Classical Upper Fifth. Dr. Glazebrook has just announced his resignation of the Head Mastership. His health has not been good for some time, and his doctors have recommended a complete rest for some months before undertaking any new work. His resignation will take effect in July.

HARROW SCHOOL.—Ten or twelve entrance scholarships will be open for competition on April 11 and 12, three £100 scholarships being offered, as well as a modern side scholarship of £80. Candidates born in or after 1891 are eligible. The English Literature prize for the sixth form has been gained by F. G. Tupper, and the Kintore (Scripture) prize by H. B. Prior. J. R. M. Butler, the promising young son of the Master of Trinity, carried off the prize for Latin *alcaics* and the Peel medal for Latin essay. There are now in the school eleven boys who have won scholarships and exhibitions at the Universities. Of these eight are at Oxford and three at Cambridge, two being for history, and the rest for classics. Four boys passed direct from this school into Sandhurst at the November examination. Among "old Harrovian" distinctions we notice the election of E. A. Burroughs to a Fellowship at Hertford College. Changes in the staff have been numerous of late. The sad death of the Rev. F. C. Savile last summer led to the promotion of Mr. M. C. Kemp to Moreton's, Mr. L. M. Moriarty succeeding to Mr. Kemp's small house. Sir Arthur F. Hort, Bart., follows Mr. F. E. Marshall at Newlands, the small houses this left vacant being occupied by Mr. A. Vassall and Mr. C. H. P. Mayo. This term Mr. G. Townsend Warner succeeds to Mr. J. W. Welsford, who gives up his house. The Dean of Wells and the Bishop of Kensington have preached in chapel this term, and we have had a very noteworthy sermon from the Warden of Radley—himself an old Harrow master. The elevation of Sir Francis Jeune and of the Right Hon. A. Graham Murray to the peerage has been the occasion of a holiday. As regards sports and games, the Easter term is chiefly devoted to racquets, fives, football, Torpids, and sports properly so called. These last are just beginning, and the public-school racquets are still some way ahead. Dr. Wood's house defeated Mr. E. Graham's, and so won the honour of being "cock house" in the Torpids. Our fives pair—E. H. Crake and R. E. Eiloart—have won honour for the school by defeating Eton and Charterhouse both in the home courts and in the return matches.

HULL, HYMERS COLLEGE.—W. H. Doughty has been awarded the Metcalfe Exhibition at Clare College, Cambridge. Mr. H. Denham takes the science work this term, in part, *vice* Mr. Aubrey, who has gone to Alexandria. An interesting event was the presentation to Mr. Ireland of a writing-table and a travelling-bag on his leaving us for his new post, as head of Mexborough School.

JERSEY LADIES' COLLEGE.—The following successes have been won since April, 1903:—E. V. Colebrook and W. G. Brown took the Honour degree of London University, the former obtaining Second Class Honours in German, and the latter Third Class Honours in English, while K. M. Wagstaff and M. I. Redstone were successful in the Pass degree. Four pupils were entered for the London Matriculation last January, and were all successful, while the five candidates who entered for various groups in the Higher Cambridge Examination secured a First and Second Class in Languages, a Second and Third in History, a First and Third in Mathematics.

RUGBY SCHOOL.—The following boys still in the school have been elected to scholarships at the Universities:—S. D. Schloss, classical scholarship, Balliol College, Oxford; C. G. Stone and E. G. Bucknill,

classical exhibitions, Balliol College, Oxford; H. A. Ormerod, history scholarship, Queen's College, Oxford; F. W. Baggallay, mathematical scholarship, Exeter College, Oxford; A. L. Hoyle, classical scholarship, St. John's College, Oxford; W. L. Knox, classical scholarship, Trinity College, Oxford; A. S. F. Gow, classical scholarship, Trinity College, Cambridge; P. G. J. Güterbock, science exhibition, Trinity College, Cambridge; J. T. Spittle, science scholarship, Pembroke College, Cambridge; L. R. D. Anderson, classical scholarship, St. John's College, Cambridge; J. E. C. Ross, mathematical scholarship, St. John's College, Cambridge; T. B. W. Bishop, mathematical scholarship, Emmanuel College, Cambridge; G. A. Chase, classical scholarship, Queens' College, Cambridge; C. H. Davies, classical demyship, Magdalen College, Oxford; G. F. Jury, classical exhibition, Corpus Christi College, Oxford; A. H. Dainton, history exhibition, Jesus College, Oxford; E. J. White, science scholarship, Corpus Christi College, Cambridge. Perhaps the most interesting event this term is the football match, which took place in the Close on Shrove Tuesday, with the XV of the Ecole Albert-le-Grand, Arcueil. The French boys—a fine, manly-looking set of fellows—played a losing game in a very plucky manner. They were somewhat handicapped by having played a hard match the previous day, and were scarcely so fresh as they would doubtless have been otherwise. The game was watched by a large number of spectators, who were all disappointed that our enterprising opponents were not rewarded by even a single "try." The "Crick" run took place on March 16; the winner was F. J. Okell.

SHREWSBURY SCHOOL.—The school concert held early this term (after postponement from last December) was an occasion of probably unique interest, being the fortieth presided over by the *doyen* of school conductors and choirmasters, Mr. Walter Hay. A presentation on the part of many Old Salopians and others was made in felicitous terms by the Head Master to Mr. Hay on his retirement. He has been succeeded by Mr. H. W. Moore, M.A. Last term was marked by the retirement of another veteran, Mr. G. H. Lock, who had been senior mathematical master for thirty years. Mr. W. C. Burnet, Exhibitioner of Worcester College, Oxford, has joined the mathematical staff. The Halifax Society (a small historical society named after the famous "Trimmer," a distinguished Old Salopian) has held one meeting this term, when the head of the school read an interesting paper on "The Navy in Tudor Times." The fiscal question continues to arouse the interest of the School Debating Society. An adjourned debate resulted in a large majority in favour of Mr. Chamberlain's proposals. A new dark room, fitted with all conveniences for developing, printing, and enlarging, has been recently built, and opened this term.

ST. OLAVE'S SCHOOL.—Of 15 candidates for the College of Preceptors Examination all passed, 7 with Honours; of 5 candidates for the London Matriculation, 4 passed; 9 candidates for L.C.C. clerkships have recently passed and are now in the Education Department. Exhibitions and scholarships at Cambridge:—E. J. Cushion, £40 for classics at King's College; S. W. Grose, £30 for classics at Christ's College; E. W. Harber, £30 for science at Trinity Hall; A. C. Cole, £40 for science at Corpus Christi College; T. J. Wood, £20 for mathematics at Queens' College. Our Friday evening entertainments have been well varied, including, as they have done, a lecture by the Rev. W. J. Sommerville on "The Far East," another by the Rev. F. B. Meyer on "The Formation of Character," a recital by Mr. E. Pertwee, and a lecture on "Trajan's Column" by Miss Penrose.

ST. PAUL'S SCHOOL.—Among scholarships recently gained at the Universities may be mentioned K. Lewisohn's and W. H. Stewart's at Oriel, and P. T. B. Clayton's at Exeter. H. Power and R. C. Christie have passed direct into Sandhurst. Power took first place in classics. Mr. Phillips, of Keble College, has filled the vacancy caused by the departure of Mr. Shawyer, who is now at Clifton College. Mr. F. E. A. Traves will leave at the end of the term to take up his duties as Inspector under the Board of Education. An interesting portrait of the great Duke of Marlborough, one of the most famous of Old Paulines, has been presented to the school by Captain and Mrs. Robert Noel. Trial eights are hard at work on the river. Those that train for the school sports and the boxing competition are many and enthusiastic. We hope to do well at Aldershot, with two representatives who have already boxed there.

STREATHAM HILL HIGH SCHOOL.—The annual prize-giving was held on February 22, the eighteenth anniversary of the opening of the school. The Bishop of Rochester presided, and the Hon. Mrs. E. S. Talbot presented the prizes and certificates. The Higher Certificate of the Oxford and Cambridge Joint Board was gained by D. Elwin, M. Stanley, and M. Wright; and Higher Certificate letters by M. Jarman and N. West. F. Costello obtained the Full Certificate of the Royal Drawing Society; and three Kindergarten students—D. Haslam, A. Woods, and W. Stanley—the Higher Certificate of the Froebel Union Examination. The Company's Scholarship was awarded to D. Bartlett, and the Gabriel Musical Scholarship to M. Wright.

FLORIGENE

(NEW REGD. TRADE MARK)

"DUST-ALLAYER"

is an odourless fluid for Floors now being used for the Hygienic and Economic treatment of all kinds of Wood, Linoleum, Cork Matting, Mosaic Tile, and other paving in

COLLEGES, LABORATORIES, & SCHOOLS;

also Government and Municipal Buildings, Art Galleries, Factories, Libraries, Offices, Museums, Warehouses, &c.

"FLORIGENE" absorbs and fixes all dust or dirt as it comes in contact with the floor and purifies the atmosphere. It is a labour-saver and floor-preserver, and can easily and quickly be applied.

No scrubbing or damping is necessary, only the occasional sweeping with a hard broom, when the dust or dirt, which is held, will roll in front and not be re-distributed.

Books, Furniture, Fixtures, and other contents of a room seldom require dusting or cleaning, as dust and dirt never rise from the floor after treatment.

The effect of each application of "FLORIGENE" lasts from 2 to 4 months, according to the wear.

THE "DUST-ALLAYER" CO.,

Offices:

165 QUEEN VICTORIA STREET, LONDON, E.C.

Contractors to H.M. Office of Works, &c.;

H.M. The Lords of the Admiralty.

Buchanan Buildings, 24 Holborn, E.C.

TONBRIDGE SCHOOL.—The following are distinctions outside the school:—H. G. Chick, studentship in Russian, Caius College, Cambridge; F. W. Thompson, open classical scholarship, Pembroke College, Cambridge; H. V. Edmunds, open classical scholarship, Rustat, Jesus College, Cambridge; H. F. Houlder, open classical exhibition, St. John's College, Oxford; D. R. Pye, open natural science scholarship, Trinity College, Cambridge; G. G. Nelson, open natural science scholarship, Christ's College, Cambridge; E. S. Dougall, open natural science exhibition, Pemberton College, Cambridge; C. J. C. Pratt, open modern language scholarship, Caius College, Cambridge; A. Poland, First in the "Britannia" Class and Prize List. Mr. G. A. Wathen, M.A., late Scholar of Peterhouse, is leaving the staff to take up the duties of Head Master of the Lahore Model Training School, India. He is succeeded by Mr. J. S. Hallam. The football season now past has been one of the most successful the school has ever had: 14 matches played—11 won, 3 lost. Sherborne, Haileybury, and Dulwich were all defeated.

UPPINGHAM SCHOOL.—The Rev. J. A. Lane, M.A. Emmanuel College, Cambridge, has been appointed to the vacancy in the staff in the place of the late W. d'Auvergne Barnard, whose sudden death last term, after more than thirty years of faithful service in the school, has caused deep and widespread regret amongst many generations of Uppinghamians. The new Memorial Hall is to be opened by Lord Roberts on Thursday, the 28th. The hall, which has been built by subscriptions, is intended as a memorial to the Old Uppinghamians who fell in the South African War, and also to commemorate the splendid work done by Mr. David as head of the music of the school for nearly forty years. The hall, which has an armoury attached, is to be used for concerts and as a gymnasium. Dr. Joachim, in recognition of a lifelong friendship with Mr. David, has kindly promised to come and play at the opening concert on May 23.

WINCHESTER.—A singing competition between the various houses has been instituted this term: five choirs are competing. One of the Chancellor's medals for proficiency in classical learning has been awarded to N. O. Freeman, Trinity College, Cambridge. We offer our best congratulations to the senior mathematical master, C. Godfrey, Esq., on his appointment as Head Master of the Royal Naval College at Osborne. At a meeting of the masters on March 17 a motion was carried *nem. con.*, "That it is desirable to introduce into our curriculum definite instruction in the English language." The Head Master

pointed out that the motion implied a desire to recognize English as a separate subject, and promised to consider the matter at once. In the School Debating Society a motion against the practice of capital punishment was lost by 31 to 3; and another, declaring the yellow races a danger to Western civilization, was lost by 26 to 9.

PRIZE COMPETITIONS.

The Translation Prize for March is awarded to "C.G.C."

The winner of the Translation Prize for February is Miss R. L. Forbes, Walkerburn, Peeblesshire.

The winner of the Extra Prize for February is Miss Eleanor F. Humphreys-Owen, Glansevern, Berriew, R.S.O., Montgomeryshire.

Le bel esprit moderne n'est ni philosophe, ni poète, ni historien, ni théologien, il a toutes ces qualités si différentes et beaucoup d'autres; il est obligé de dire assez de choses inutiles, parce qu'il doit fort peu parler de choses nécessaires. Le sublime de sa science est de rendre des pensées frivoles par des traits. Qui veut mieux penser ou mieux vivre? Qui sait même où est la vérité? Un esprit vraiment supérieur fait valoir toutes les opinions, et ne tient à aucune. Il a vu le fort et le faible de tous les principes, et il a reconnu que l'esprit humain n'avait que le choix de ses erreurs. Indulgente philosophie, qui égale Achille et Thersite, et nous laisse la liberté d'être ignorants, paresseux, frivoles, oisifs, sans nous faire de pire condition! Aussi mettons-nous à la tête des philosophes son illustre auteur, et je veux avouer qu'il y a peu d'hommes d'un esprit si philosophique, si fin, si facile, si net, et d'une si grande surface; mais nul n'est parfait; et je crois que les plus sublimes esprits ont eux-mêmes des endroits faibles. Ce sage et subtil

N.B. NO BUSINESS NO FEE.

DR. CORNWELL'S SCHOOL BOOKS.

Edited by J. CORNWELL ROUND, M.R.C.S.

With numerous Revisions and Additions by BEN JONSON.

A School Geography. Ninetieth (Memorial) Edi-
tion. With Coloured, Black-and-White, and Star Maps; also numerous
Diagrams. The Reviser has brought this book thoroughly up to date, and it
now contains 384 pages, exclusive of 64 pages of Maps. 3s. 6d.

"The book is an immense storehouse of accurate geographical information, and a
very suggestive book to the teacher."—*Educational Record*, June, 1904.

"Seeing that it has thirty-six coloured Maps, and nearly twice as many uncoloured,
the price is wonderfully low."—*The Journal of Education*, July, 1904.

Geography for Beginners. Seventieth Edition.

Has been Enlarged and Revised, Maps and Diagrams having been also added.
It now contains 160 pages of interesting matter. 1s.

"We have tested both these books on many points, and in every case with the
most satisfactory results."—*School Guardian*, May, 1904.

Grammar for Beginners. Ninety-first Edition. 1s.

Revised, and with additional Section on Analysis of Sentences.

The Young Composer. Forty-ninth Revised En-
larged Edition, contains Sections on the Composition of Sentences, Paragraphs,
Essays, Précis, Letters, Telegrams, and Commercial Documents, also on "Press
Corrections." 1s. 6d.

"The book is complete and practical."—*School Guardian*, Oct. 1904.

"Altogether the book is a very valuable aid for those who wish to gain the power
to write clearly, accurately, and gracefully."—*School Manager*, October, 1904.

Allen and Cornwell's School Grammar. 1s. 9d.

philosophe n'a jamais compris que la vérité nue pût intéresser; la simplicité, la véhémence, le sublime ne les touchent point. "Il me semble," dit-il, "qu'il ne faudrait donner dans le sublime qu'à son corps défendant; il est si peu naturel." Isocrate veut qu'on traite toutes les choses du monde en badinant; aucune ne mérite, selon lui, un autre ton. Si on lui représente que les hommes aiment sérieusement jusqu'aux bagatelles, et ne badinent que des choses qui les touchent peu, il n'entend pas cela, dit-il; pour lui il n'estime que le naturel; cependant son badinage ne l'est pas toujours, et ses réflexions sont plus fines que solides.

By "C. G. C."

The wit of these days is no mere philosopher, nor poet, nor historian, nor theologian: he has the very diverse qualifications of all these, and many more: he is driven to much worthless talk because he may hardly mention anything that concerns our real needs. He has attained the height of his science when he expresses frivolous reflections in smart phrases. Who wants to think better, or to live a better life? Who even knows on which side truth lies? A truly superior intellect presents all opinions in their several values, and holds by none. He has seen the strength and the weakness of all principles, and has recognized that the mind of man has but a choice of errors. A tolerant philosophy indeed, which puts Achilles and Thersites on a level, and leaves us free to be ignorant, lazy, frivolous, or idle, and none the worse for it! So we set its illustrious founder above all philosophers, and I am free to admit that few possess intellectual ability so philosophical, so subtle, so dexterous, so precise, and so comprehensive. But none is perfect: and even the loftiest intellects have, I take it, their weak spots. This sage and subtle thinker has never learned that the bare truth could interest: simplicity, fervour, grandeur, leave his followers cold. "I hold," says he, "that there should be no venturing upon lofty flights but with extreme reluctance: they are so very unnatural." Isocrates would have every subject handled lightly: none is worthy, he thinks, another tone. If it be urged that men devote themselves seriously even to trifles, and only make fun of what does not move them deeply, he says that all that is quite beyond him: he sees no value in anything but what is natural: though that is sometimes more than can be said of his playful treatment; and the reflections he makes show more of elegance than of real strength.

Over and above various pitfalls which filled the Fourth and Fifth Classes and the difficulty of finding approximate equivalents for words like *bel esprit*, *fin*, *net*, the connexion of ideas was not always easy to trace. *Qui veut mieux* is (to borrow a term from the Latin Primer) suboblique: it expresses the views of Isocrates. "Who, forsooth, cares about the improvement of his conduct or understanding?" would make this clear. Again, in *Aussi mettons-nous* the emphasis is on the qualifying sentence that follows: "Let us, then, if you will, place in the front rank of philosophers the illustrious exponent of this theory, but we must allow that he has his weak side." To revert to particular points. *Le bel esprit*: not "modern wit," but "your wit of to-day" or "man of parts." Under Isocrates (which several turned into Socrates) a *littérateur* of the day, as the notes tell us, Rénoud de Saint-Marc, was designated. *Doit fort peu parler*: not "ought," but "is bound (by the fashion) to touch lightly on serious matters (essentials)." *Le sublime*: "The crowning point of his philosophy (the perfection of his art) is to express a commonplace in an epigram." "To make thoughts appear ridiculous" was a common misrendering. *Fait valoir*: "gives due weight to," "emphasizes for his own profit." *N'avait que le choix*: "was only free to choose between different forms of error." The tense was generally disregarded. *Qui égale*: here an ignorance of the "Iliad" produced extraordinary blunders, and I was not sure whether those who construed "which equals Achilles and Thersites" understood the meaning. *Si fin*, &c.: "so acute, so nimble, so incisive, and so comprehensive." *La véhémence*: "energy," "vigour," rather than "vehemence." *A son corps défendant*: "as a last resort," "under protest." *Ne les touchent point*: so it stands in my edition of Vauvenargues, but other editions give *le*, and this is clearly the true reading.

LITERARY PUZZLES.

A Prize of One Guinea is offered for the best set of answers to the following:—

1. "Il est bon de tuer, de temps en temps, un amiral pour encourager les autres."—By whom said, of what admiral?

2. Tennyson ("Life") says: "I never put two 'ss' together in any verse of mine."—Give instances to the contrary. What bearing has the *dictum* on a disputed reading in Gray?

3. "I have militated in former times, not without glory; but I grow peaceable as I grow old."—Identify the quotation and the allusions.

4. Do you know what a *splacknuck* is?

5. "Nous avons quarante oies qui gardent le Capitole."—Who are the geese, and what is the Capitol?

6. "Some gentleman missed his snuff-box, and Hook said [the Freemasons' Tavern was kept in those days, you must remember, by Mr. Cuff, not by its present proprietors]—well, the box being lost and asked for, Hook opened his silent jaws and said: '... Shall I tell you what he said? It was not a very good pun that the great punster then made.'—Suggest the pun.

7. Name references in poetry to balloons.

8. "Wisdom and Wit are little seen,
And Folly at full length."

—Name the three persons.

A Prize (or Prizes) of Two Guineas is offered for the best version in Latin, French, or German of Shenstone's quatrain:

Whoe'er has travelled life's dull round,
Where'er his stages may have been,
May sigh to think he still has found
The warmest welcome at an inn.

Initials or a nom de guerre must be adopted by ALL competitors, but the prize-winners will be required to send real names for publication.

Those in the First Class are entitled on application to a copy of "Essays in Translation."

All competitions must reach the Office by April 15th, addressed "Prize Editor," THE JOURNAL OF EDUCATION, 3 Broadway, Ludgate Hill, E.C.

CLERGY MUTUAL ASSURANCE SOCIETY,

2 & 3 THE SANCTUARY, WESTMINSTER, S.W.

FOUNDED 1829.

Patrons—THE ARCHBISHOP OF CANTERBURY; THE ARCHBISHOP OF YORK.

President—THE BISHOP OF LONDON.

Vice-President—THE LORD HARRIS.

Chairman—THE DEAN OF CANTERBURY.

Deputy-Chairman—SIR PAGET BOWMAN, BART.

Secretary—W. N. NEALE, Esq.

Actuary and Manager—FRANK B. WYATT, Esq., F.I.A.

The Society offers the BENEFITS of MUTUAL LIFE ASSURANCE on highly favourable terms to
THE CLERGY AND THEIR RELATIVES.

THE WHOLE OF THE PROFITS BELONG TO THE MEMBERS.
Accumulated Fund, £4,194,485. Annual Income, £398,982.
Bonuses Distributed, £3,723,720.

The ANNUAL PREMIUMS are LOWER THAN THOSE USUALLY CHARGED.

Under the "REDUCED PREMIUM" system—applicable to Whole-Life and Endowment Assurances—only FOUR-FIFTHS of the ordinary Annual Premium is payable, the other one-fifth remaining a debt to be repaid out of Bonus.

Notwithstanding the LOWNESS of the Premiums charged, the BONUSES are on an EXCEEDINGLY HIGH SCALE. For the 20 years ending May, 1901, the Bonuses distributed were equal to an average Cash Return of no less than 46 per cent. of the Premiums paid.

The CONDITIONS OF ASSURANCE are most favourable, and SURRENDER VALUES, PAID-UP POLICIES, and LOANS ON DEPOSIT OF POLICIES are all on an exceedingly liberal scale.

IMPORTANT NOTICE.

No Agents employed and no Commission paid for introduction of business, whereby about £10,000 a year is saved to the Members.

Assurances can be readily effected by direct communication with the Office,

2 & 3 The Sanctuary, Westminster, S.W.

AN EASTER TRIP IN NORMANDY.

By DE V. PAYEN-PAYNE.

OF all the fair provinces of France Normandy is probably the best known to the inhabitants of these islands; for, although Picardy is nearer to our shores, yet its scenery is not such as to tempt the holiday seeker. It requires some boldness, therefore, to offer advice to colleagues who may know more than myself. Besides, there are many other reasons that make it particularly fit that English men and women should visit the home of the ancestors of many of them. As Freeman so truly says:

Now, Normandy and England, of course, have many points of difference, and doubtless a man who goes at once into Normandy from England will be mainly struck by the points of difference. But let a man go through Southern Gaul first, and visit Normandy afterwards, and he will be struck, not with the points of difference, but with the points of likeness. Buildings, men, beasts, everything will at once remind him of his own country.

Easter is a very suitable time for such a trip; for in the summer we often plan to go further afield, and a fortnight or three weeks is amply sufficient to gain a glimpse of the chief points of interest. When Easter falls late, as it does in 1905, there is less cause for regretting the foliage of the summer.

Dieppe is an inevitable starting place for a Norman trip. Many visitors to France know it only as an uncomfortable point of debarkation, but the town of Duquesne deserves a day or two's exploration. An afternoon spent in the Forest of Arques, five miles distant, with a glimpse at the Château and its memories of the Conqueror and Henri quatre, will be long remembered. An afternoon train from Dieppe will land one by evening at Caudebec on the Seine, the capital of the old province of Caux. This is a well known centre for artists, and all who appreciate the sight of a town almost exactly in the state it was during the Hundred Years' War will wish to stay here long. The splendid flamboyant church and the narrow streets have many opportunities for the photographer. It is best to stay in an hotel on the wide Seine quay; for air and light were not too plentiful in mediæval towns, in spite of all their quaintness. If the visitor is here at the time of the full moon, he will see the curious *mascaret* or Seine bore, a two-foot wave that rushes up the river with some force and noise, especially at the equinoxes.

One mile east of Caudebec is the Abbey of St. Wandrille, now a disused seminary, and seven miles further on is the glorious ruin of the Abbey of Jumièges, whence came our Archbishop Robert of Canterbury. Three miles to the west of Caudebec is Villequier, a picturesque fishing village where one of Victor Hugo's sons was drowned, and where his wife lies buried. Yvetot, chiefly known from Béranger's poem, is seven miles to the north, but hardly deserves a visit. As soon as the tourist can tear himself away from Caudebec, he had better get to Rouen, the largest town in this trip, and the most important. If the weather be favourable, and if time allows, the pleasantest way of getting there is by boat, up the river. At least three or four days should be given to Rouen, and Mr. Theodore A. Cook's monograph in the "Mediæval Towns Series" (Dent, price 4s. 6d.), although not so entertaining as is his "Old Touraine" for a Loire trip, should yet accompany the traveller who wishes to know more than his Baedeker can tell him.

After Rouen our next resting place should be Lisieux, which can be reached by changing at Serquigny in a few hours. In one respect Lisieux is superior even to Rouen, and that is in its quantity of timber-built houses. It is unfortunate that most of them are in the narrow Rue des Fèves, where they cannot be properly seen or photographed; but the double-gabled one at the corner of that street is probably the most photographed house in Europe after the Knochenhauer Amthaus at Hildesheim, its presentment having even served as the backcloth of a music-hall. The Cathedral will seem tame after Rouen, in spite of Ruskin's encomium and the memories of that most abused of Beauvais bishops, Pierre Cauchon.

From Lisieux, an hour's journey lands one at Caen, which, rather than Rouen, is the capital of Norman Normandy. Here Freeman delighted in seeing resemblances with his own Wessex countrymen, and tells us, in proof of the large admixture of Saxon blood, that there were twenty-four families of the name of Langlois in the town. "Caen," he says, "shares with Oxford

the peculiarity of having no one predominant object. Caen and Oxford throw up a forest of towers and spires without any one building being conspicuously predominant." The tourist will be mainly attracted by the great abbeys founded by the Conqueror and his wife—Saint Etienne, a severe masculine building, in whose choir is a black slab, inscribed "Gulielmus Conquestor"; and La Trinité, its smaller feminine counterpart. There is also the town church, St. Pierre, and the Castle, which was built by the Conqueror of that Caen stone which has served for countless edifices in France and England. Caen is familiar to many teachers from the holiday courses held there in the summer, as they are at Honfleur, Lisieux, Saint Malo, and other centres. An excursion may be made from Caen to Falaise, the birthplace of the Conqueror, where the Castle rears its donjon on a "cliff," and whence the successors of Arletta can be seen beating their washing in the little stream below. Rising higher than the Keep is the Tour Talbot, erected by the great English general of the Hundred Years' War. The room that is shown as the birthplace of the Conqueror has probably no more right to the title than has that other room in Carnarvon Castle to being the birthplace of Edward II.

Returning to Caen, we pass on to Bayeux, which we visit for its Cathedral and its tapestry. The latter on one continuous roll of linen is now preserved in the Museum. There are still some travellers who love burdening themselves with large quantities of luggage; they prefer moving their quarters as seldom as possible. It will be easy for these to make Bayeux a trip from Caen, and then go straight to Coutances, staying, perhaps, a few hours at Saint Lo between two trains. The situation of the Cathedral of Coutances, perched on its hill, is picturesque, and its towers can be seen from Jersey, which was for long included in its diocese, until the Channel Isles were handed over to Winchester. Ruskin saw in the western towers the evolution of the steeple from the house roof. Coutances, has, like many French cathedral towns, notably Chartres and Reims, a very fine secondary church—St. Pierre. Less than thirty miles on we come to Avranches, another hill town, whose Cathedral must have appeared even better than that of Coutances. But it was destroyed in the Revolution, and only a few scattered columns remain, at one of which Henry II. is said to have received absolution for the murder of Thomas Becket.

Coutances and Avranches do not need more than two days, and then we can get to the Mont St. Michel. Here two days or even more, can be spent with much pleasure at the hotel of the renowned omelette-maker, Mme. Poulard. The Church of the Abbey, which has now been restored as a national monument, will be admired by all; and those who have read Mackenzie Walcott's "Conventual Arrangement" will be interested in seeing how the monks, having no room to build their Abbey on the flat, piled room above room and placed their wonderful cloisters on the roof. A walk round the rock at low tide should be attempted by all. We now cross the frontier of Brittany and stop at Dol to see its grey granite Cathedral, sung of by Victor Plarr, and its curious *menhir* surmounted by a crucifix. If the traveller is lucky enough to be there on a market day, he will see many of the quaint Breton head-dresses. A short journey brings us to Saint Malo, the final stage of the trip. Any remaining time can pleasantly be spent in the native town of Chateaubriand, of Duguay-Trouin and many other old sea-dogs. On no account should the trip up the Rance to Dinan be missed. Others may be made to Dinard, Cancale, and many another seaside spot. The boat will bring us back either straight to Southampton, or after a halt at the Channel Isles. Such a trip as I have sketched out should not take more than a fortnight or three weeks; but it must not be thought that we have exhausted the beauties of Normandy. We have not seen the Abbey of Fécamp, or the cliffs of Etretat, the great port of Le Havre (with Harfleur and its flamboyant church and memories of Henry V.), or fashionable Trouville, the peninsula of the Côtentin, or the church of Dives, wherein hangs a list of the companions of the Conqueror. There remain the Minster of Evreux and the tombs of the Orléans family at Dreux, and, last but not least, the Saucy Castle of Richard at Les Andelys.

As to cost, the modest traveller can reckon on an outlay of from eight to ten francs a day, in addition to railway fares. All necessary expenses should be covered by a ten-pound note. In addition to Baedeker ("Northern France," price 7s.) and Joanne ("Normandie," Hachette, price 7 frs. 50 c.), other

useful books are Freeman's "Sketches of Travel in Normandy and Maine" (Macmillan, price 8s. 6d.), Dearmer's "Highways and Byways of Normandy" (Macmillan, price 6s.), and the monographs on the Cathedrals of Rouen and Bayeux and the Abbey of Mont St. Michel in "Bell's Series of Continental Cathedrals" (1s. 6d. each).

THE USE AND MISUSE OF TERMS IN SCIENCE TEACHING.*

By T. L. HUMBERSTONE.

IF ever the history of human error, so nobly planned in "The Caxtons," comes to be written, a very large section of the work will deal with the use and misuse of words; and, if a smaller work on the sins of science masters were compiled, I fear the same subject would bulk largely in its pages. Perhaps we suffer less from the tyranny of words than our forefathers of a few generations ago; for theological and metaphysical discussions are less in fashion and the foundations of science are more truly laid. Yet I think you will agree that what Locke, in his chapter on the abuse of words, says of words like "wisdom," "grace," and "glory," could be applied with equal force to many of the words used in the teaching of science—that, "if a great many of those who use them, should be asked what they mean by them, they would be at a Stand, and know not what to answer: a plain Proof that they learned those Sounds, and have them ready at their Tongue's end, yet there are no determined *Ideas* laid up in their Minds, which are to be expressed to others by them." Science teachers are continually using the same word in different senses, and this, as Locke remarks, is "a cheat and abuse: the wilful doing whereof can be imputed to nothing but great Folly, or greater Dishonesty." It is certainly a fault which teachers of science, of all people in the world, should strive to avoid; for nothing can do more to pervert the pupil's whole idea of scientific method and perspective than the careless use of important words.

Of these, perhaps the most important are the words "law" and "prove." The word "law" had its origin, of course, in commands imposed by Divine or superhuman authority—though, as Prof. Karl Pearson points out in his "Grammar of Science," the first tribal laws (such as those relating to marriage) were based on natural facts. This sense, and what may be called the "legal" meaning of the word, are, however, entirely foreign to science. The use in science of the expression "obeying a law" is a survival of the older meaning of the word. Of dictionary definitions of a scientific law there is, of course, a multitude. The place of honour must be given to the definition in Dr. Murray's "New English Dictionary," as follows:—"In the sciences of observation a theoretical principle, applicable to a defined group or class of phenomena, and expressible by the statement that a particular phenomenon always occurs if certain conditions be present." The only word in this definition to which exception might be taken is the word "always." Prof. Karl Pearson, in the work already cited, states that "necessity of natural law" is really an unjustifiable phrase, and that only in the field of conception are we dealing with certainties. And Huxley says, in his "American Addresses," that "any human belief—however broad its basis, however defensible it may seem—is, after all, only a probable belief, and our widest and safest generalizations are simply statements of the highest degree of probability." Thus, in the strictest language, the rising of the Sun to-morrow is not a certainty, but only a probability which tends to become more and more a certainty with each succeeding day. We cannot absolutely predicate the operation of any natural law either for the infinite past or for the future. To the "Century Dictionary" definition of "law" the following useful note is appended:—"A mere empirical formula which satisfies a series of observations sufficiently, but would not hold in extreme cases, is not considered a law. A special fact is not a law; but a subordinate principle—as that planets revolve in ellipses—is, or is

not, a law according to the shade of meaning with which that word is used." Perhaps Prof. Pearson's definition of a scientific law as "a brief statement or formula which resumes the relationship between a group of facts" is the most useful and convenient. He is careful to point out that the laws of science merely *describe*, and never *explain*, the routine of sense impressions. The only test of the truth of a law is, therefore, actual comparison of the law with the facts themselves—that is, historical observation and physical experiment.

There is, I suppose, no question that the most perfect example of a law is Newton's Law of Gravitation, because it resumes in a very simple manner a very wide range of facts. It should be noted that the facts which were provided by the elaborate observations of Tycho Brahe were first resumed by Kepler into statements usually called Kepler's Laws. These are, I think, rightly called laws because they apply to *all* bodies moving round a central body, such as the Sun. Kepler's Laws were arrived at by trial, and only after some hundreds of possible generalizations had been tested and abandoned. It was left to the genius of Newton to devise a simple formula applicable to all bodies. His formula is so perfect that within the range of our experience no exception has been found. Indeed, when an apparent exception, such as the irregular movement of Uranus, was observed, the astronomers of the day did not for a moment doubt the validity of the law, but looked for a body which would account for the discrepancy; and, as we all know, their investigations resulted in the discovery of the planet Neptune. Our own mental attitude towards the law is like that of Adams. We have so often correctly predicted the motions of heavenly bodies, the eclipses of the Sun and Moon, the tides of the Earth, and so forth, by means of the law, that any exception is certainly quite unexpected and is becoming almost inconceivable. But it is important to notice that the law only applies to "bodies," or, more strictly, "particles." We are ignorant whether it applies to quantities of matter smaller than we can "perceive," such as atoms and electrons.

At the other extreme we have formulas of a more or less empirical character, which are generally known as laws. A good example is Bode's Law on the distances of the planets from the Sun. This so-called "law" is not well supported by any theoretical consideration, though attempts have been made to reconcile it with the Nebular Hypothesis; and the relationships it expresses may be accidental.

The connexion between mathematical "conceptions" and reasoning and physical laws is of the greatest importance. If we accept the truth of Euclidean axioms and definitions and the usual ideas of force and energy, Newton's Law of Gravitation can be mathematically deduced, and becomes, on the assumption mentioned, a certainty. But the obvious truths expressed in Euclid's axioms have been the subject of much discussion and many treatises. We cannot say for certain whether a triangle formed by joining three stars would have all its angles equal to two right angles, and it is well known that the axiom relating to parallels presents great difficulties to mathematicians. The marked difference in character between the "conceptions" of mathematics and the "perceptions" of physical science should be clearly realized. No one has seen a straight line, a surface, or a circle: they are figments of the imagination. The point I wish to make clear is that many laws are supported by mathematical or other theoretical reasoning, after certain assumptions have been made, and our conviction of the validity of a law must depend to some extent on the connexion between practical and theoretical considerations. This may be illustrated by the Laws of Thermodynamics, which are mathematical deductions from the postulates of the Kinetic Theory, stated by Stallo as follows:—

1. That a gas is composed of solid particles which are indestructible and of constant mass and volume.
2. That these constituent particles are absolutely elastic.
3. That these particles are in perpetual motion, and, except at very small distances, in no wise act upon each other: so that their motions are absolutely free and therefore rectilinear.

Stallo goes so far as to declare that "the Kinetic Hypothesis has none of the characteristics of a legitimate physical theory. . . . It postulates what it professes to explain." But the Kinetic Theory of gases is in harmony with Boyle's Law and Charles's Law. The truth of Boyle's Law is corroborated by a statistical calculation based on the Kinetic Theory—though we know in actual practice that no gas "obeys" Boyle's Law, which only strictly applies to an "ideal" or "perfect" gas.

* Abridged from a paper read at the Conference of the Public Schools Science Masters' Association, January 14, 1905.

Avogadro's so-called "law" is, however, of quite a different character. Like the laws just mentioned, it can be deduced from the Kinetic Theory: but it cannot be established by experience, because it is concerned with conceptual molecules; and there can be little doubt, as Stallo says, that it would be more properly regarded as a hypothesis. In Ostwald's "Physical Chemistry" it is always called a "hypothesis" or a "postulate." We should, I think, do well to avoid altogether the use of the word "law" in this connexion. Gay Lussac's Law of Volumes is also deducible from the Kinetic Theory and from Avogadro's Hypothesis. Its experimental truth is incontestable, and for this reason it is rightly called a "law"; but it is doubtful whether Dulong and Petit's Law should be called a "law," because it refers to atomic weights. Possibly the word "rule" might be a useful substitute for "law."

I suggest, therefore—firstly, that for certain formulas at present known as laws which have no theoretical basis and are of an empirical character, such as Bode's Law, it would be well to discontinue the use of the word "law"; secondly, that we should be careful not to apply the term "law" to hypotheses like Avogadro's; and, thirdly, that we should bear in mind the different character of the conceptual bases in the case of the various laws. It does not appear to be necessary that different terms should be used to distinguish, say, Newton's Law of Gravitation from the "Laws" of Chemical Combination; but it is important that the differences of the kind I have pointed out should always be borne in mind.

I have so far said nothing of Archimedes' Principle. The problem in this case is whether the Principle is a law established by experiment, or is an axiom. We all know that to Newton's mind the 47th Proposition of Euclid, Book I., required no proof. The idea that, if a portion of a fluid is removed, the same forces will act on any body which takes the place of the fluid removed as acted on the fluid before it was removed, seems to me to be a mental conception not very difficult to grasp: and the fact that the formula is usually called a "principle" and not a "law," suggests that the view I have stated has always been accepted.

I hoped to refer to and discuss in some detail the words "matter," "mass," "force," and the so-called Laws of Motion. The subject is, of course, exceedingly complex. In Thomson and Tait's "Properties of Matter" there are no fewer than thirty-four physical definitions of "matter," and the metaphysicians have propounded many more. The recent researches on radioactive bodies may profoundly modify our ideas of matter and its ultimate constitution. I do not, therefore, propose to discuss these words at any length, and will refer any one interested to Prof. Karl Pearson's admirable chapters on the subject. Force to Newton was a "conception," and it is still so regarded by physicists. Thus Prof. Karl Pearson distinctly states that force is "an arbitrary conceptional measure of motion with no perceptual equivalent." The ordinary text-book definition of "force" is fallacious because force is not the *cause* of motion: force cannot be conceived without matter, nor matter without force. It follows, therefore, that the so-called Laws of Motion are not scientific laws in the ordinary sense: they are more in the nature of postulates or definitions, and, therefore, cannot be "proved" experimentally.

The word "prove," it seems to me, is more often used in the wrong sense than any other scientific word. Are we not, especially those of us who are "heuristic," continually instructing our pupils to prove the Parallelogram of Forces by experiment? We let them make the experiment with thick pieces of cotton, with weights, pulleys, and other human inventions, and then we expect them to establish an abstract principle which is intimately bound up with all our fundamental ideas of mechanics. I doubt very much whether the method is a correct one even for schoolboys. Prof. Pearson demonstrates mathematically why equality of masses can be tested by weighing or by a pulley. But apparently the process necessarily involves the formula $F = Mg$ or the corresponding formula that force is proportional to rate of change of momentum. But, having in this way devised and graduated our weights, we proceed to use them to demonstrate the very principle, postulate, or definition by which the weights were graduated. Not long ago one of my pupils was asked in a well known public examination to describe an experiment to "prove" that force is proportional to the rate of change of momentum. I confess I am very doubtful whether any such experiment can be devised. And what I have said

applies to the "proving" of Archimedes' Principle, if, as I have already suggested, it may be regarded as a scientific postulate. In any case, we ought to be extremely careful in the use of this word "prove": we are seldom able, with the rough apparatus at our command, and without the ability to explain to our pupils the elaborate corrections which are usually necessary, to "prove" any law at all in our school work.

I once knew a "heuristic" teacher who was so anxious to "prove" Archimedes' Principle to his pupils that, knowing a cube of 16 c.c. would not actually weigh 16 gms. less in water, on account of air films, he actually had the sides of the cube slightly hollowed out. And in our chemical experiments the limits of error are so considerable that I very much doubt whether any intelligent pupil of elementary science has ever satisfied himself by his own experiments of the truth of the Laws of Chemical Combination. Indeed, does not the truth of such laws depend, if Prof. Pearson's definition of a "law" is accepted, on every experiment which has ever been made? Let me give a homely illustration. Suppose you explained to a stranger that the law of your school—using the word in its scientific sense—was that the first-school bell rang at seven a.m., would you, on hearing its unholy tinkle at that hour, state deliberately that the law was thereby "proved"? I think not, and yet we are continually making similar assertions in our laboratories. There is no humbug of this kind in the teaching of mathematics, though I am fearful that, by the new methods of teaching geometry, pupils may get the idea that, for example, they can prove the 47th Proposition of Euclid, Book I., by cutting up the squares. They may "test" it in this way, but the proof can only be arrived at, after certain assumptions have been made, by a long train of reasoning.

There are two other words of the same kind which we often misuse—the words "cause" and "effect." We do not clearly recognize that these are only two terms of a sequence, and that, just as the finished product of one industry may become the raw material of another, so the effect arising from one cause may become the cause of another effect. Prof. Poynting, in his interesting address to the British Association in 1901, went so far as to suggest that the word "cause" should no longer be used in science; but, unfortunately, he did not attempt to suggest a substitute. If it is, of course, wrong to say that a stone falls to the ground "because" of the force of gravity, or of hydrogen and chlorine uniting "because" of their great affinity for one another, unlike our classical colleagues, we must always be prepared, with Dr. Johnson, to plead "stark ignorance" on many questions.

I am sorry I have not been able to deal more fully with the use of chemical terms. The words "atom" and "molecule" open a large field for inquiry, especially in view of recent scientific work. At present, it is perhaps too early to state whether the Atomic Theory will be modified to any great extent by the recent researches on radio-activity. But we should, I think, impress very clearly on our pupils that the Atomic Theory is only a theory, a working hypothesis, which has been of some service in the past, but which we shall willingly abandon in the future, if the need arises. Though it is very difficult to avoid endowing atoms with reality, it is now more necessary than ever that their conceptual character should be impressed upon our pupils. "Equivalents," and not "atomic weights," are the things we can speak of with certainty.

There are many other chemical words which we misuse. The word "affinity," for example, is a comfort in difficulties like the blessed word "Mesopotamia" to the old lady. And when we are really ignorant we swell the breast and talk of "catalytic action." Our pupils like the jingle, and I fear they often think they have found an explanation. "Allotropic forms" as applied to the rhombic and monoclinic forms of sulphur is really a misuse of the word, unless we are prepared to regard ice and water as allotropic forms of the same substance.

May I, in conclusion, raise one question which is cognate to the subjects already discussed—I mean the question of the age at which we can with profit attempt to teach our pupils such conceptions as those involved in Avogadro's Hypothesis? I was until recently one of the victims of the old "School of Science" Regulations of the Board of Education, of the character of which the majority here present are probably ignorant. I must therefore explain that the curriculum for boys of twelve and thirteen, and even younger, which gave most satisfaction to the inspectors of the Board of Education was one which provided

nine or ten hours' instruction in science. The consequence was that before a boy was fourteen he had consumed, without however assimilating, nearly all the elementary experimental and general work in chemistry and physics; and before further progress could be made it became necessary to try to make him understand at the age of fourteen the conceptions involved in Avogadro's Hypothesis and other important theoretical principles. I am willing to confess that I have always failed in this attempt, and I believe it is a waste of time to attempt such work until the average boy is fully sixteen years old. The reports of examiners bear eloquent testimony to the same effect. It follows from this consideration alone that, if boys begin science at twelve or thirteen, as I think they should, we should be content with much less than nine hours' science per week. I am convinced, too, that we have made laboratory work too much a fetish during the last few years, and that, if science masters were to speak truth and show their souls, they would admit that a great deal of valuable time has been wasted in science laboratories. Thus, if a boy has made one or two gases for himself and has acquired manual dexterity in the fitting up of apparatus, I doubt whether much is gained by letting him make all the other elementary gases himself. If I may make a suggestion, it would be that we should concentrate our efforts in an attempt to get science included in the curriculum of all public-school boys, and be prepared, if necessary, to limit the time devoted to science work by modern-side boys.*

A NATIVE GIRLS' SCHOOL IN TUNIS.

By TIRVA CARPOF.

UNTIL lately nobody thought of improving the situation of the Mussulman women; nothing has been done, even in the Mohammedan countries conquered by France or England. And that is a big mistake, both on humanitarian grounds and from the point of view of extending French or English influence.

We must confess, and it is a true fact, that it is not an easy matter to enter the Arab homes. A male European cannot visit any of them; no other man, except the father, the husband, or the brother, can ever see a woman or a girl of the Mohammedan religion. Thus, the Mussulman home is severely watched, and the women are prisoners, knowing nothing, not even the most ordinary matters of domestic life. They have never learnt anything; they do not know how to read, to write, or to count—nothing of all those elementary notions which our young children have learnt during their early youth.

Knowing nothing, the women are unable to make any comparison. If we show them a picture or photograph, they are as like as not to put it upside down; they see no difference. In the poor classes the woman is a mere drudge, a beast of burden and of reproduction. Amongst the richer classes she is a thing of luxury bedizened with barbaric ornaments and pampered until she has ceased to please. In no family does the woman associate herself with the future or the education of the children. The boys, as soon as they have left the nursery, are directed entirely by the father, and the daughters grow up, like the mother, without tuition, occupied only with childish and sometimes vicious things. If you ask an Arab how many children he has, he will answer always without counting the daughters. On all occasions we are struck by the inferior state in which the Arab woman is left. Nothing is more curious, for instance, than to meet a caravan of those wandering Arabs who stay near a *douar* (Arab village) for five or six months. It is especially during the summer that they travel through the desolated and dry lands. The caravan passes, with its picturesque and fantastic appearance, the camels, donkeys mounted by men, wearing over the *chechia* immense straw hats made of *halfa*, as large as an umbrella. Those indolent men, worn out by fatigue, look as if they were sleeping; they have sometimes children with them, at the back of their saddle. Then behind, thin, emaciated, ragged, sordid, you see the women, trudging, trotting, having tied on their back their last little one. As there

is no room for all on the camels and the donkeys, the women have to walk.

From the poorest Tunisian home to the Court of the Bey the woman is in the most miserable condition, taking really no part in the family or social life. Her state is pitiful. We should like to take her away from the wretched life to which she is doomed, to give to her the first rudiments of instruction, of hygiene, to teach her to bring up with intelligence her children. At first it would be necessary to teach her how to manage a house, to make her home agreeable to the husband, who presently leaves it, because he finds it too dirty, too untidy, and too noisy, on account of the shouting children. She should know how to count, in order to balance her budget, and then, by-and-by, she would become her husband's real companion. Less unoccupied, her imagination would become more refined, and would be no more directed only towards wrong or childish things. Certainly in that line lays a great work to be done for the European ladies residing in Mohammedan countries. The Moorish homes are closed to men, but not to women, who could, several together, visit their Arab sisters and realize their wants. The native women are happy when they are visited; everything interests them; and, if they had the will, European ladies could very quickly have them under their influence.

A lady I know, who had gained the confidence of several Mohammedan ladies, and has the *entrée* of their houses, has furnished me with much interesting information. As she spoke Arabic and needed no interpreter, she soon got to understand her new friends, who are nothing else than great children. They looked upon her as a doctor, because she was able to give to them very simple remedies for slight ailments; they judged her very clever, as she could give them explanations of a number of ordinary things, mysteries to them. They were astounded because she visited them in her ordinary costume, without jewels, when to receive her they were wearing dresses with gold and silver embroideries, and putting on all their precious gems. She could hardly make them understand how Europeans object to gaudy colours and tinsel as bad taste. They stared at her as a marvel, unfastening her hair to see what kind of hair pins she was wearing, and then they asked her to dress up as an Arab.

When she agreed and put on their heavy garments, large silk trousers, blouse adorned with precious stones, little *houris* cap, they cheered, so nice did they find her, and they expressed their joy by a "you you," the sounds made by clapping their tongue with their fingers.

In seeing them so stupid, wholly engrossed in these trifles, do we not think immediately of their intellectual needs, and the good which could be done to them? For instance, is it not a pity to see, at Tunis, where the European population is so large, how little interest is taken in the Mohammedan women? As France is the protecting country of Tunis, one would think that the French ladies would look after the Mohammedan, but, unfortunately, this is not what happens; it is the Italian ladies who must be credited with nearly all the improvement of their condition. However, we must recognize that the wife of the present Résident-Général—that is the title of the representative of the French Government there—noticing all that ought and could be done, organized a school for the young Arabian girls. It was something quite new, and the success appeared so doubtful that the courageous organizer found at first not only no help, but even strong opposition. As the Arabs keep their daughters confined in the harems, how will they allow them to attend a school? So argued even her friends. But she persevered. The start was then made with broad regulations and a very easy programme. Its object was only to teach the girls how to read, to write, and to count in Arabic and French; to teach them also to do some hand work and the first principles of hygiene and cleanliness—knowledge entirely unknown to the Arab.

The school started May 1, 1900, with eight pupils; to-day their number is already sixty. The increase is slow, but sure. Step by step the Arab families (the most advanced) consent to send their children to this school. Entirely covered with their veil, clothed in their *haicks* (large cloaks), and accompanied by their domestics, they arrive at eight o'clock in the morning, and remain until four o'clock in the evening. They receive from home the mid-day dinner, in order to avoid an unnecessary outing. This meal is another lesson for them. One after the other, the pupils are asked to set the table, and they are taught

* It is not intended to suggest that, in the writer's opinion, the time devoted to science in the modern sides of public schools is generally excessive.

also to behave properly. They learn how to use knives and forks, and drop their previous habit of eating with the fingers. Certainly it is not the intention of the foundress to bring them to a high standard of civilization; it would be impossible and useless for the present. She wants only to take them away gradually from the vegetative life in which they are confined.

It is hard to realize how pleased these girls are by their new life. Their natural intelligence finds free play; they learn quickly and well. Those who have attended the school from the commencement (four years) are already different from those who have been kept inside the harems. They have lost their wild appearance, they no longer bite each other, they know how to count, how to solve small problems, how to speak French, and they have received so much general information that their conversation has ceased to be empty. Really, these pupils who started not long ago will be able to make better wives for the actual generation of the young Mohammedans, who, more and more, go for their studies to the Continent, and return with our Occidental habits, and a great dislike, if not disgust, for the lack of refinement of the Arab women they find at home. In order that this Mohammedan school for girls in Tunis might succeed, the first condition was to attempt no religious propaganda. It is certain that not one Arab will be converted, and, accepting this as a postulate, the promoters have given the girls of this school a teacher for the Coran. That inspired confidence in the parents. The presence of an old *moued-deb* (teacher of the Coran) was the best proof that the native religion was to be respected.

The direction of the institution of which we are speaking has been given to the widow of a high French official of the Tunisian Government. Her close connexion with the Mohammedan world and her knowledge of Arabic were needed for the success of her task. Several French girls who know the language of their pupils are teachers, and they give lessons in French, fancy work, hygiene, and domestic economy. Lastly, they teach, during the recreations, how to play! It is curious, and almost incredible, that children cannot play; but it is the case with most of these. At home, from their youth, they are accustomed to be idle, crouched on a carpet, the mind as well as the body asleep. When one starts to teach them to play, the awakening of the brains follows quickly that of the body.

Everything interests and amuses them. The opponents of the school—for, like all new things, the school has some—pretend that these efforts are useless, owing to the short number of years that the young girls are able to attend school. In fact, at the present time they leave school at fourteen years of age, because they marry at fifteen; but we must not forget that an Arab girl of fourteen is like a European girl of eighteen; and six years spent in school—they enter usually when they are eight years of age—leaves certainly a deep impression and an amount of knowledge not to be despised, when we think of the surroundings of ignorance in which they live. From another point of view, it is certain that, with the next generation, the number of years for study will be increased.

Anyhow, as this school exists, it is a first step towards an improvement in the condition of the Mohammedan women, and some satisfactory results have already been obtained. Besides, this generous attempt will open the eyes and attract the attention of the whole world, and especially of the countries which have large Mohammedan possessions, to the wretched condition of the Mohammedan woman.

THE COMPARATIVE VALUE OF HOME AND CLASS WORK.

AMONG the many problems confronting educators and school teachers one of the most important is the value of home work. The question has been asked: "Is home work necessary or desirable?" The answers are of a conflicting nature, dictated as they are by the individual opinion of theoretical pedagogues or by the experience of observant schoolmasters. For some time efforts have been made in Germany and Switzerland to determine the problem by the help of psychological experiments performed on children of the national schools of both countries. These investigations have been carried out with the utmost care by the united efforts of

psychologists and national-school teachers, whose work enables us to form an opinion based on the results of strictly scientific research.

In 1904 Dr. E. Meumann, Professor of Psychology at the University of Zurich, published the methods* and results of a long series of careful experiments carried out by him, with the help of school teachers, on children of the national schools of Würzburg and Zurich. If the conclusions drawn by Prof. Meumann are correct, viz., that the value of home work has been greatly overrated—a saving of time and energy might be effected by a method of teaching which would reduce home work to a minimum.

Prof. Meumann points out that in these investigations it is absolutely necessary for theory and practice to go hand in hand. Before giving a detailed account of his measurements of the work, he contrasts the conditions under which home and school work are done. The pupil, he says, who works at home is isolated, more or less dependent on himself; the pupil in class works as a member of a community, as one of a whole body. The work of the isolated pupil must therefore be judged as the effort of a single person. On the other hand, work done in class is a kind of collective work—for a number of pupils striving together for one and the same object are in such close mental relation one to another that we may speak of a working community whose efforts must not be considered as the sum of individual efforts, but as the work of one community as a whole.

The experiments of Prof. Meumann are based on comparisons of the work of pupils isolated under strictly controlled conditions with that done in class, of work done at home with that carried out in school. In all cases the faults of each task were classified according to kind, and carefully noted. The experiments were undertaken at the same time by Prof. Meumann and Dr. Mayer, national-school teacher at Würzburg. The problem they sought to solve was: "Is class work more beneficial for the individual, and under what conditions does it produce better results, than the work of an isolated pupil?" While Dr. Mayer strove to answer the question by means of tasks such as are usually set in school, Prof. Meumann, in order to determine the limit of memory, subjected the pupils to a purely psychological investigation, the result of which, he says, was astonishing. There was little difference between the isolated and the class work of pupils of thirteen and fourteen, whereas in that of the younger children—especially those of eight and nine—it was remarkably great. It was found, on an average, that in class examination children of eight and nine repeated from memory three words all correctly, of five words 4.09, and of seven words 4.06; whereas, in examining children singly, the average was—three words correctly, of five words 3.4, of seven words 3.2. These numbers show that children remember considerably less when examined singly than when they are in touch with the class. The results were so constant that there was no child who could remember more in isolated examination than in class examination, and they are all the more astonishing as the disturbing influences in a class might be supposed to detract the attention of the pupils. On asking the children whether they preferred to do the exercises in class or alone, 80 per cent. answered decidedly in favour of class work, 15 per cent. were undecided, and a very few confessed to being disturbed by the noises and whispering that usually go on. These latter proved to be mostly nervous and weak children, though among them there were pupils of exceptional ability. The power of concentration does not seem to belong to any particular degree of intellectual capacity.

Prof. Meumann gives a detailed account of the excellent methods used by Dr. Mayer and other teachers in their experiments. Results were arrived at by a comparison of class work with isolated work—dictation, mental arithmetic, combination exercises (by which Mayer sought to determine, or "measure," the intellect of his pupils), learning by heart, written arithmetic—and of class work with home work. Many various types of pupils were chosen as subjects for the experiments, differing from one another in capacity, conduct, temperament, and social standing, the work being judged in connexion with a careful character sketch of each pupil previously written by the teacher. The children worked in three different manners,

* "Home and School Work." Experiments on National-school Children, by Dr. E. Meumann. (Leipzig: Julius Klinghardt. 1904.)

according to the orders of the teacher—viz., (1) quickly and carefully; (2) slowly and carefully; (3) as quickly as possible. By these orders the inner mental condition was, in a measure, regulated, and the work more easily compared.

The measurements of such complicated psycho-physical performances as are included in school work presuppose practical sense and inventiveness in the experimenter, for it is scarcely possible to set up general rules for the methods to be observed. Those adopted by Prof. Meumann and his fellow-workers were based on the quantitative determination of memory as applied in experimental psychology, and on "combination" together with a method invented for and carefully adapted to the circumstances. The numbers obtained represented two kinds of values—on the one hand the time in which the work was done; on the other the faults contained in it. The work was judged and its intrinsic value measured by the product of time and faults.

The results of the measurements were decidedly in favour of class work, which was done, strange to say, by every child in considerably less time than isolated work. This was least conspicuous in dictation, which may be explained by the fact that the teacher was obliged to wait for the slower pupils before he could proceed. How great the saving of time may be seen from the following numbers, the result of an exercise in combination (supplying missing words in sentences):—

		Isolated.		Class.
Pupil F.	Combination ...	13 min. 11 sec. ...	6 min. 45 sec.	
" W.	" ...	6 " 52 " ...	4 " 40 "	
" M.	" ...	12 " 48 " ...	5 " 50 "	

and so forth.

The class work of slow pupils is often done in *half* the time isolated work demands, whereas habitually quick workers seem to gain comparatively little time in class. The latter almost reach the approximate limit of their capacity in isolated work, and are therefore not capable of much greater exertion, whilst the slow workers need the stimulus of the class to do their best.

In comparing *results*, the greatest reduction in time was found to occur in mechanical learning by heart. The best mental conditions for class work were obtained by the order "carefully and quickly," both other commands producing a state of mind less favourable for any kind of work.

In order to control the results, Dr. Mayer repeated the experiments during the holidays, and found to his astonishment that even the direction "quickly and carefully" failed to effect the same saving in time as during term-time. He explains this by the absence of the greatest stimulus—ambition, whereas Prof. Meumann is of the opinion that more elementary psychical processes are here at work.

The quality of the work was judged by the absence of faults in a strict sense. 74 per cent. of all work done in class show less mistakes than the corresponding isolated work, memory work again heading the list. In all work done in class there is a tendency to uniformity, both the time taken for the exercises and their quality being more even than in isolated work. This uniformity appears under all conditions of class work. The results of holiday experiments show that, although no appreciable difference in time is obtained, the quality of the work continues to be higher than that of isolated pupils.

The product of the values of time and quality gave the average numbers expressing the total results. It was found that class work done under the direction "carefully and quickly" showed a decidedly higher value than isolated work. The order "as quickly as possible" proved most unfavourable, especially in mental arithmetic and tasks exercising the imagination. For the execution of the latter isolation seems to be not only favourable, but necessary. The beneficial influence of class work was felt by the best as well as the weakest pupils, but in the case of the latter the gain was extraordinary—timid and nervous children often losing their fear under the influence of co-operation. Strange to say, mental concentration is not weakened, as might be expected, but, on the contrary, strengthened by common work. If, therefore, a child has great difficulty in fixing his attention on isolated work, it follows that isolation tends to aggravate habits of thought-wandering.

The characteristics of pupils hitherto discussed, such as independence and timidity, are characteristics of will-power, but the experiments prove that, with very few exceptions, the above

remarks concerning class work apply also to pure intellect. Now and then a case occurred of a child with weak intellect whose interest for some one subject would not be sufficiently roused in class, and whose class work, therefore, compared unfavourably with that done in isolation; but even this applied only to certain subjects, and no case was found where class work was unfavourable in all subjects. On the other hand, the influence of class work sometimes proved detrimental to decidedly gifted pupils, more especially to such as combined high intellectual qualities with quickness of temperament.

Prof. Meumann regrets that, owing to a lack of psychological data, no explanation can yet be given of the results of the experiments: they can only be stated as facts.

GERTRUDE KNECHT.

BLACKHEATH PROPRIETARY SCHOOL.

CAUSES which are operating, and will probably continue to operate, in many secondary schools have contributed towards the decision recently made public by the proprietors of this school—that they are unable to carry it on after the end of the present term. But another cause—common, it may be hoped, to few schools—has made this decision necessary—the fact that it was built on leasehold, and not on freehold, ground. The school was founded in 1830, and was perhaps the prototype of that system on which several famous schools were established in the next thirty years. Three other schools of the same type were founded in or near London at the same time, two of which were the Kensington Proprietary School and the Islington Proprietary School; but of these Blackheath School is the sole survivor. In 1830 Blackheath was a stronghold of Evangelicism, and the school owed its origin to the desire of several of this party to have a school in their midst at which their sons could be educated in the principles of the Church of England. The Rev. Joseph Fenn (then a leading Evangelical clergyman in Blackheath) took a prominent part in the foundation of the school, which opened in 1830 with a head master—the Rev. S. Tennant—a second master, a portress, and twenty-five boys. The lease was for seventy-five years at a small ground rent, the buildings being erected by the proprietors, who, in return for their £20 share, secured the right of nominating a pupil, but were not allowed to receive any dividend.

Mr. Tennant did not prove successful as a head master, and the numbers were at a low ebb when Mr. Selwyn, father of the present Head Master of Uppingham, and a man of considerable force of character, appeared upon the scene. He fostered the boarding-house system, and, under his sway, the school gradually rose from 30 to 290 boys, of whom the larger number were boarders. Among his pupils he numbered several who rose to eminence—in particular, Lord Bowen and Mr. E. E. Bowen, of Harrow. In the days of his successor the boarding-houses dwindled; but this was probably due to the fact that Blackheath was becoming more of a suburb and less of a country place. Mr. Selwyn clearly saw the dangerous position of a school built on leasehold land, and records showed that he pressed upon the governing body of that day a scheme to remove the school bodily—a proposal which met with stout resistance on their part.

What he probably foresaw has now come to pass. The original lease would have expired in 1906, but seven years ago, at a time when the numbers of the school were rising under the present Head Master, the Committee of the school surrendered their lease, and, with some trouble, succeeded in getting a short lease of twenty-one years, determinable at the seventh and fourteenth years—of course, at a vastly increased rent. Then came an outbreak of scarlet fever in 1902, which, through loss of fees and large expenditure on drainage, swept away most of the reserve fund. Like many other first-grade secondary schools, as *The Journal of Education* recently pointed out, Blackheath felt the diminution of professional and business incomes caused by the increased taxation and commercial depression that marked the close of the Boer War and the following years. Numbers began slowly to fall off, and last year the Committee felt they could not face the second term of the lease without a substantial reserve fund, especially as they represented what is practically an unlimited liability company. An appeal was

made for £4,000, but much less than this sum was subscribed, probably because it was felt that the proposed expedient did not promise permanency. Owing to the failure to raise this fund, the present Head Master decided to resign, and the proprietors on February 8 felt themselves obliged to wind up the school as at present constituted at Easter next. It was a step taken with great reluctance and regret, for few schools of its size can show a longer roll of illustrious Old Boys. It can count among its *alumni* Lord Bowen, his brother Edward Bowen, of Harrow, Sir Mortimer Durand, Sir Charles Rivaz, Mr. Goschen, John Mason Neale, Canon Dalton, Prof. Courthope, Mr. Oswald Airy, Mr. Claud Baggallay, Edward Lefroy, Sir Woodhouse Richardson, and many other well known men.

Since this decision of the proprietors has been made known, a syndicate or association has been formed by some residents in Blackheath to obtain a fresh lease, to take over the buildings and fittings of the School, and to carry on the School itself on slightly different lines from Easter next. If this scheme is successfully carried through, certain restrictions which hampered the old Proprietary School will necessarily disappear.

CORRESPONDENCE.

SCHOOL AUTHORITIES AND ASSISTANTS.

ONCE BIT, TWICE SHY.

To the Editor of The Journal of Education.

SIR,—You have put very forcibly the case for Short: will you allow an assistant master to reply for Codlin?

One of the disadvantages of living in an old country that has not lately been well shaken up by a revolution—has not enjoyed the uprooting of vested interests for once in a way—is that one is a victim to custom, prejudice, and tradition. Of these three fetishes the most degrading is tradition. Tradition, like precedent, is a good servant but a bad master. A tradition may be excellent or it may be the opposite—no matter: a tradition, in the opinion of the majority of people, must not be resisted. As a vampire drains the blood of its victim, tradition sucks out the vigour from originality and reduces all to one dead level.

Tradition has had much to do with the foundation and after-growth of most English grammar schools that have not been started within quite recent years. Sir William Smith leaves £90 a year to pay the master of a school at X., to be called after the founder, and £40 to provide a stipend for the usher. At the time these sums were sufficient, eked out as they were with presents in kind from the pupils. In course of time the school grows, other sums of money are bestowed on it, and it manages to slumber on for a century or so. Then comes an awakening. The inhabitants of the town discover that they want a better school. An appeal is made to the Charity Commissioners. They look into the matter, deliberate with certain persons of authority in the town, who know nothing about educational difficulties, and lay down rules how the school is to be conducted, producing a stereotyped, traditional scheme. They make provisions for dealing with bankrupt governors and describe how the accounts are to be kept: all that is forgotten is to provide means for governors to work the scheme with and to fill the columns of the elaborate ledger. Further, the possibility of a change of curriculum being necessary is not considered; tradition is to reign supreme. It was thought that the original £90 for the head was too little; so the post and salary of the usher were amalgamated with the headship; but, in return for the usher's pittance, the head had to pay any assistant masters required. As he could not pay many with his additional £40 and keep some for himself, the state of affairs was worse than before—even the payments in kind had dropped into disuse.

The next step was to command boarders to be taken, and, out of their payments for services received, to pay masters who taught the day boys at fees that did not cover their educational expenses. Sometimes the governors decided that the head would have to be in Orders, so that by working (guinea-pigging) on Sundays he might eke out a salary that was too little to support a man decently on six days' work. Some schools were

not fortunate enough even to retain what endowment they possessed. Many were robbed of their original small fortune, and yet had to struggle on, perhaps with an income of £19 a year.

This is no very unfair description of the rise of many an old grammar school and of its penury. At their foundation they may have served their purpose; when, however, they were put to a far more extended use, but left with the same slight means, their indifferent fulfilment of their duty became more and more evident. Without funds, progress was impossible.

In many cases, again, what endowment there was was sunk in a boarding house and buildings. It has often happened that a school has been provided with buildings too big for average requirements. Thus the investment of funds has not brought in what was expected. It is by no means an exaggeration to say that a large number of grammar-school headships are not worth taking. The headship may be advertised as worth £150 and a house, capitation fees and profits from boarders, estimated together at about £500 per annum at least, according to the reckoning of the governors. Inquiries by outsiders, however, show that the new head will have to take over a considerable amount of plant and pay yearly towards expenses some £250. The result is that he must work as cheaply as possible. This means masters with £60 salary and residence, and inefficiency generally of equipment.

Of course, there are exceptions. A new school is to be built at Lytham and St. Anne's which has an endowment of £250,000. But these exceptions often act disastrously on neighbouring schools. Having a long purse, they buy up scholars, and leave less wealthy schools to a lingering death, to the disadvantage of the towns in which these schools were founded. There follows a struggle for existence and a rivalry between institutions ill-adapted for the purpose, to the great hurt of education. A proper grading of secondary education is lost sight of; every one fights for his own hand. Masters and pupils suffer; the former from bodily, the latter from mental, starvation.

We may consider, then, that the present system as regards non-local schools in the majority of cases is fundamentally bad, both from an educational and from a practical standpoint. Now to look at schools created by Education Committees. While there are some such schools that are struggling under the very difficulties that I have just mentioned, lack of funds, want of proper equipment and the like, the general run of schools under the sole control of an Education Committee are prosperous; sure to be so, if not at present, after no long time, because there is plenty of money in the background. There is at least one technical school that rejoices in an income of £15,000; a municipal secondary school just started pays its head £1,000 a year and its assistant masters from £500 to £150. Every one will admit that, as this institution is rate-supported, there can be no lack of funds. In this town all secondary education is properly graded on a well-thought-out plan: the return is excellent, and the investment a good one.

As an example of salaries paid by municipal Authorities to their officials one can quote the salary of a public librarian which amounts to £300, while the librarian of an older and larger institution, who has far more responsibility and a more arduous post, is paid £180. Under a corporation we see town hall clerks advanced at no infrequent intervals by £30 a year. In a certain town one official was appointed at a salary of £300: this was raised to £350, to £400, and, after about six years' service, now stands at £450. The same scale of pay rules in the case of tramway managers and sanitary inspectors. Do masters in the old grammar schools fare as well? The head may get anything from £5,000 to nothing, his assistants anything from £300 to next to nothing.

After all, the relations existing between head masters and assistant masters are those between educated men in the same rank of life. Head masters are only presidents in the republic of letters, not autocrats of All the Russias; or, if they are, their reign will not be for ever. I am led to these observations because I have not gathered from the public actions of head masters as a body that they appreciate the aims of assistant masters and the changed position of affairs now prevalent. On the other hand, many of the Education Committees are fighting the Education Office because they mean to have some say in the appointment of assistant masters and in their dismissal. These Education Committees declare that they will not allow to head masters the power of dealing unchecked with their

assistant masters, when they do not grant this prerogative to other managers of institutions under them. Some such bodies when advertising a headship distinctly state that the head will be consulted as to other appointments.

It would seem that it would be to the advantage of school-masters to be under an Education Committee. But we must not only consider the monetary side of the question. It is beyond question that the only possible way out of our educational muddle at the present day is to agree to a general scheme of municipalizing of schools in county boroughs and to their adoption by County Councils in other places. There would be a break from tradition, there would be a benefit conferred on education, and there would be a system. Drawbacks there would, of course, be, but would these compare with the cut-throat policy, the waste, and the impecuniosity now obtaining in schools not under an Education Authority?—Yours, &c.,

A. M.

THE ETYMOLOGY OF "EDUCATION."

To the Editor of The Journal of Education.

SIR,—The extremely new note on the etymology of "education" in *The Journal of Education* for March last, at page 223, is indeed a revelation. It shows what may happen when a writer treats of Latin philology without being even aware that it is regulated by known laws, such as have been explained over and over again. The writer seems never to have even heard of the principle of gradation.

For here are his own words. In order to connect *educare* with *dúcere*, "we have to violate the laws of vowel-length and conjugation, which in classics were rigid to a degree to which we, in English, are strangers." As if the laws of phonetics were any less rigorous in Anglo-Saxon than they are in Latin and Greek!

This amazing utterance can only mean that Latin and Greek vowel-sounds are "rigid" to such "a degree" that we cannot connect a short *u* with a long one! From which it follows at once that *dux*, a leader, has no connexion with *dúcere*, to lead, because the *u* in *dux* is short in the oblique cases. Neither may we connect *fides*, faith (having a short *i*), with *fidère*, to trust (with a long one). Further, we now learn, for the first time, that *vidi*, I saw, has no connexion with *vidère*, to see, owing to the "degree of rigidity" which such a supposition would "violate." And, as for connecting three such grades as are seen in the Greek *πίθω*, *πέποιθ-α*, and *ἔ-πιθ-ον*, what a shock such an idea would give to "rigid" laws!

The best of it is that, though we must never violate the rigid quantity of a vowel, we may do what we like with a consonant, and derive *ē-duc-āre* from a root *dug*, as if the interchange between *c* and *g* were highly elastic!—Yours, &c.,

WALTER W. SKEAT.

COLONIAL AND FOREIGN NOTES.

AUSTRALIA.

The education administration reform movement in Australia to which frequent allusion has been made is now proceeding at a rapid rate in nearly every State of the Federal Union. Victoria was the first to abandon the system of placing at the head of the Governmental Department a Civil Service official, and to substitute a highly trained expert. The success of Mr. Tate, the first Victorian Director of Education, has induced the biggest and the smallest of the other States of Australia to appoint also a Director of Education. The New South Wales Director has not at the time of writing been selected, but I should not be surprised if one of the Royal Commission whose reports on education in New South Wales were summarized in *The Journal of Education* is selected. In Tasmania the first Director is Mr. W. L. Neale, a South Australian official whose record at Adelaide is of the best. Mr. Neale has a hard row to hoe in the little island State, where out-of-date methods in education are the rule. In New South Wales the new Director will have an easier task, for there has been such a stirring of dry bones through conferences, press agitations, and popular meetings that the public mind is now really alive to the fact that the mother State is far behind Europe and America in her educational methods.

Melbourne University is now out of her financial troubles, thanks to the generosity of Mr. David Syme; Mr. Carnegie, the Scotch-American millionaire; Mr. Higgins, the Melbourne barrister; and Mr. R. J. Larking, the leading spirit in educational matters in the local Chamber of Commerce. The State has provided £12,000, and private effort some £13,000, to rescue the University from degradation. Evening lectures and an up-to-date commercial course of study have been established as parts of the University curriculum. Forty mining and agricultural scholarships, enabling bright sons and daughters of the poor to take up University courses, have been provided by the Government, and in other ways the University has had new life infused into it by the combined hands of her socialistic legislature and the individualistic "wealthy lower orders"—as the late Judge Higginbotham used to call them. In this connexion it is interesting to note that the Adelaide Chamber of Commerce is pressing the sister University of Adelaide to follow the example of Melbourne, and increase all facilities for higher commercial education.

An important move has been made in the direction of improving secondary education in Victoria through the discovery that the Act constituting the Melbourne University gives the University power to inspect secondary schools. At the end of November last year (1904) the University Senate adopted a code of regulations which will enable secondary schools on the payment of a sum of £5 and the expenses of a University inspector to have the benefit of an inspection and examination scheme which will, if applied with satisfactory results to the individual schools, immensely advance their status in the community.

FRANCE.

The new Minister of Public Instruction is M. Bienvenu-Martin, deputy for Yonne. If the progress of education in France were to be measured by the number of Ministers who have controlled it in the last thirty years, the evidence of rapidity would be very striking. Unhappily, it is a matter in which numbers go for nothing. What is needed is a man of ability and initiative. The French can seldom find an Acland, and then they cannot keep him.

For several years Montpellier has made a systematic inspection of the eyes of pupils in its primary schools. The oculists report that two-thirds of the schools are defective in respect of natural lighting, that the artificial lighting is rarely sufficient, and that forms and desks are not generally adapted to the height of the pupils so as to save their eyes from strain. Abnormal vision is commoner in primary than in higher schools, and among boys than among girls. Whilst boys are more subject to myopia and hypermetropia, girls supply the majority of cases of astigmatism. In all, no less than 30 per cent. of the children in primary schools have some imperfection of sight. On entering a school a child is furnished with a card on which are inscribed, not only name, age, address of parents, &c., but also a figure indicating the state of his eyesight. When there is a defect, medical treatment follows, and sealed letters containing advice are addressed to the parents. If a boy has colour-blindness, he is warned against preparing for the Navy or for the railway; and short-sighted girls are bidden to avoid the trade of an embroideress or dressmaker. Pupils remain under the surveillance of medical inspectors during the whole period of their studies, being examined as often as the condition of their eyes requires it. So with watchful kindness do the French authorities care for the future citizens of France. Although the rules for lighting will be known to many readers, we repeat them from the Montpellier report. Light should fall from both sides or from the left. If it comes from above, the room is liable to be unduly hot in summer. Light from the front is dazzling; light from behind casts the shadow of the pupil on to his desk. Walls ought to be painted in some soft colour, such as light yellow or water-green. Window surface should be to wall surface at least in the proportion of 1 to 3.

We have been watching with the utmost interest the French experiment of reserving Greek for an *élite*. So far we cannot say that the experiment has failed, since it has been found impossible to perform it. Some schoolboys take the subject because they have a *penchant* for it; others under pressure from parents or counsellors; and others, again, because it is an untried field for their incompetence. Writing in the *Revue Universitaire*, M. Georges Seure declares that Greek classes at present are neither better nor worse than in the past; that they contain, as they always will contain, the normal proportion of strong and weak, capable and incapable pupils. Can nothing be done, he asks, to help the situation? He recommends that, just as every modern language and every branch of science has a special teacher, so certain teachers, *agréés* in Letters or Grammar, should concentrate their later studies on Greek and be employed in the larger *lycées* to teach the subject exclusively. They would communicate to their pupils the enthusiasm begotten of specialization, and, carrying them from beginning to end

of the Greek course, would, in virtue of long intimacy, exercise more influence than an ordinary form master. Keeping an open mind, we are not persuaded that even special teachers—it is delightful to see how the notion of special *pupils* has gone—will save Greek in France. And, as to the intrinsic merits of the proposal, those who learned Greek in former times learned it best from a succession of teachers, each of whom had his favourite authors and emphasized different points of scholarship.

In the department of la Manche it has been the unpleasant custom of parents to denounce teachers who have offended them to the inspectors by means of anonymous letters; and the inspectors have been wont to hand the letters to those concerned with a request for written comment. A circular now directs that unsigned communications are to be destroyed as soon as they arrive, and are not to form the subject of any inquiry. In like manner, unsigned letters of complaint published in journals are henceforth to be ignored. The change might have suggested itself sooner. If signed, accusations are often groundless; unsigned, for the most part, they spring from malice and are invalidated by cowardice.

Under the auspices of the International Guild a gentleman has been lecturing the French on their use of certain English words. He reproached them with "shakehand," bade them not to call a skating-rink a "skating," or a smoking-jacket a "smoking," and urged that pedestrianism is not in England styled "footing"; which, indeed, it is not. Yet these things occur in familiar speech, or at most in the language of the *feuilleton*. What shall Englishmen say of them while a book like Murray's "Dictionary" can talk of the *Code civile*?

GERMANY.

The most remarkable feature of educational life at Berlin just now is the attention that is being paid to physical exercises. For playgrounds and gymnasiums (in the English sense) the magistracy votes this year £9,680. Moreover, it will expend £250, instead of £150 as last year, in providing instruction in swimming. The swimming lessons have been very successful, 80 per cent. of those instructed having learned to swim. Girls as well as boys are now to be taught. Public playgrounds (distinct from the small yard that a German school usually has) are being opened in various quarters of the town.

Perhaps some of our readers will care to have, for consideration, the scheme of science teaching outlined by Herr Ruska in the *Südwestdeutsche Schulblätter* :—

UNITED STATES.

The *Educational Review* for February contains an able article on "Modern Languages in Secondary Schools." The teaching of them in America he describes as barren, antiquated, and unenlightened. What he recommends to improve it is, to be brief, the New Method. But change of method must be supplemented by change of teachers. We quote the words that relate to the latter part of the proposition: "Our modern language teachers of the future must be native Americans. Both in Germany and France the sway of the French *maître* and the English master has been discontinued. A pupil learns a foreign language most effectively from one who is his countryman and a trained teacher, and who has himself been compelled to master its difficulties. There intervenes another practical consideration. If we do not train modern language teachers from our midst, we shall presently lack even *foreign* teachers of any but the most mediocre attainments. There is no reason, in view of the great present demand for foreign language teachers abroad, why a German or a French teacher who has acquired a speaking knowledge of English should migrate to America when his command of English gives him an enviable advantage at home. The inferior quality of recent foreign accessions to our teaching body admits of no other explanation. Even now cases are not infrequent in which teachers, after a brief experience in this country, or in England, return to advantageous positions on the Continent."

The point is one of great importance; and it is one upon which head masters, whose culture is, for the most part, that of Cam or Isis, are seldom well informed. It is hard to conceive that a German, for example, qualified to act as a secondary teacher in his own country would accept for a permanency a mastership in an English school, the

conditions of employment being here so much more unfavourable to the employed. And as to Germans, there is the further difficulty of dialect. If English boys learned to speak exactly like their master, they would often acquire a German that would expose them to ridicule among the students at Bonn or Heidelberg. Doubtless there are many excellent and highly qualified foreign teachers of French and German in our schools. But we suggest that it is impossible for an untravelled head master to discriminate. Now the New Method calls for increased discrimination, in that, under it, the teacher means more and the book less.

American school-men cannot make up their minds as to the best style of handwriting to use in schools. Data obtained from the St. Louis Exhibition—or, must we say, Exposition?—show that out of twenty-five States in which the vertical system had been introduced, fifteen have reverted to the sloping. It is argued, in some quarters, that vertical writing is too slow, too easily imitated, lacks individuality, and is liable to become "back-hand." The principals of the Chicago schools, having been consulted, are found to be divided in opinion: 123 favour the vertical style, 89 are for the sloping, and 34 declare themselves indifferent. A large commercial firm in America states that competitors for a clerkship who wrote vertically would be pronounced ineligible. We must leave our readers to choose for themselves. Our own favourite style is—the legible.

President Eliot, in his annual report to the Corporation of Harvard University, rails in good set terms at football. Attentive reading makes it clear that his objections are not so much to football as to the way football is played in the United States. Be his own words our witnesses:—"Coaching from the side lines, offside play, disabling opponents by kicking and by heavy blows on the head, and especially by blows about the eyes, nose, and jaw, are unquestionably helpful to a triumph, and no means of preventing them by both players and coaches has yet been found." Are we to understand that the coaches are in the habit of administering "blows about the eyes, nose, and jaw" to players during the progress of the game? If so, President Eliot is right in objecting to it. Coming from so high a source, the diatribe has been followed by the usual outcry about the dangers of athleticism. Yet men of experience will tell you that they prefer them to the dangers of "slackness."

Here is a scrap of American news that has human as well as educational interest. Among the graduates on February 7 from the Hillhouse Evening School at Newhaven, Connecticut, was Jane Fans, a negress, aged seventy-three. Jane is an ex-slave, and for many years has desired to learn to read. Recently she applied to the evening school for instruction, and has been such a diligent student that at the graduating exercises she received the prize from among two hundred and fifty pupils. She is very proud of her ability now to read the Bible and the daily newspapers.

The clergy of the Church of England ask for a living wage, and "£400 a year all round" has been specified as the sum that will content them. Since secondary teachers are drawn from the same social class, have received an equally expensive academy training, and possess, in general, much higher attainments, "£500 a year all round" might seem to be a fair enough demand for them to make. In America college professors are the latest claimants for augmented salary. Whilst they could formerly live on 1,000 dollars, the bare necessities of life cost more and the standard of living has been raised in all classes; so that what once were luxuries are now indispensable. It is true that salaries have risen. At Harvard fourteen professors received last year 5,000 dollars each, and the average for the forty-two professors was nearly 4,000 dollars. Yet the American conscience is to be awakened to the fact that college professors are underpaid. It will have to be more sensitive than the English conscience if it is greatly moved.

American adepts in the matter of truancy have come to the conclusion that the housing of large numbers of children in great barracks is detrimental to their physical, intellectual, and moral welfare. All modern truant schools are organized upon an entirely new plan, which provides something like family life. The cottage system has taken the place of the dormitory system, cottages two or three stories high being grouped about a central school building. New York has now given its sanction to the modern system by acquiring a large tract of land for the erection of a cottage truant school. Home training, parental control, habits of good conduct—these are the things that truants lack; they are best supplied by reproducing for them, as far as possible, the home and its influences.

The National Educational Association will meet this year at Asbury Park, New Jersey, July 3-7. The president is Superintendent William H. Maxwell, who is sure to see about him, in the noted summer resort, a great host of educators and the friends of education.

The National Educational Association.

INDIA.

It will be remembered that we reported lately a new departure in Travancore, by which a conscience clause was created in favour of Indians. As might have been anticipated, a demand is voiced that the precedent set there should be generally followed. Thus

**Wanted—a
Conscience Clause
for India.**

Mr. V. S. Sastri, in the *Indian Review*, pleads ably for change. The Government, he contends, should be strictly neutral with regard to religious instruction. But at present it gives a considerable part of its education grant to missionary bodies which force religious instruction on Hindu and Mohammedan pupils with the hope of converting them to Christianity. In this way the money of the Indian people is employed to undermine their religion. Educated Indians have begun to feel a new pride in their ancient civilization, and see in the compulsory religious teaching of the mission schools a degradation of their faith and a slur on their conscience.

Mr. Sastri, on what authority we know not, says there is reason to believe that the Department of Education will be favourable to a general introduction of the conscience clause. We leave the subject, however, to make a few jottings in reference to the education of women. A writer in the *Educational Review* contends that the Indian women are utterly unprepared for higher education in English, and that they must draw their mental food from the different vernaculars of India. Hence, he tells us, the problem is to improve vernacular books so that they may represent modern thought. He may be right. We are content to believe that the women must be educated. Accordingly we learn with satisfaction that a normal school for women was opened at Lahore on January 4, 1905. The school will be under the control of the Education Department, and will be held, for the present, in the premises of the Victoria Girls' School. The object is to prepare women to work as teachers in girls' schools. Inspecting officers of all grades, *tahsildars*, and other officials, will be able to give valuable assistance in promoting the success of the institution, and it is expected that the wives and female relatives of male teachers, as well as widows of some education, will, in many cases, offer themselves for training. Stipends not exceeding Rs. 8 a month will be awarded to selected students, and boarding accommodation will, if required, be provided free of charge. And not only the Education Department, but also the natives themselves, are stirring in the matter of education for women. For Babu Brajamohan Dutt's Prize essays are invited on "The Shortcomings of the Existing System of Female Education in India." The competitors are to be native women of any age, and they may write either in Bengali or in Sanskrit. It is the true principle—to interest the women themselves in their own physical and intellectual development.

The following resolution was passed unanimously at the recent Indian National Congress held at Bombay:—"That this Congress, while thanking the Government of India for the increased outlay on primary education, promised in their resolution of March last, and for the institution of technical scholarships for the study of technical arts and industries in foreign countries, repeats its protest of last year against the retrograde policy adopted by Government in regard to higher education, as calculated to officialize the governing Boards of the Universities and to restrict the scope of University education generally; and the Congress places on record its emphatic opinion that, in view of the large surpluses which the Government are now realizing year after year, it is their clear duty to make a much larger allotment than at present out of public funds for educational expenditure, so as (a) to spread primary education more widely among the mass of the people, and to make a beginning in the direction of free and compulsory education; (b) to make due provision for imparting instruction in manual training and in scientific agriculture; (c) to provide for the better manning and equipment of Government colleges and high schools, so as to make them really model institutions; (d) to establish at least one central fully equipped polytechnic institute in the country, with minor technical schools and colleges in different provinces."

The Report of Public Instruction in Travancore shows an increase for the year (1902-3) of 11 schools and 6,750 scholars. Yet a single paragraph that we here transcribe will be an answer to those who fear that primary education in India is progressing with too rapid strides: "In almost every village of Travancore the old *Asans* (indigenous schoolmasters) still hold their sway and decry the modern system of education among the ignorant folk, who have still unbounded faith in the wisdom of their ancient *Gurus*. Some of these ancient *Asans* hold their position by virtue of heredity—their ancestors having followed the profession for generations. In some cases the parents of the school-going population in rural parts are the pupils of the present *Asan* or one of his ancestors. Hence they hold him in great reverence and consider his teaching the best they can secure for their children. In other cases a half-starved *Asan* waits on the influential man of the village, under whose patronage he starts a school which is largely

attended by the children of that village. The people generally resent any insistence on regular attendance and strict discipline, and the masters are reluctant to submit to the control and supervision of the Educational Authorities, without which no aid from State funds could be given. These circumstances account greatly for the existence of a very large number of unaided private schools."

CAPE COLONY.

As to the great institution that will perpetuate the memory of Mr. Cecil Rhodes at Grahamstown, we learn from the official *Gazette* that the Council, since its appointment, has been making considerable progress in the organization of the new College. At present the list of professorships arranged for stands as follows:—(1) English (with Greek for the present added), (2) Classics (without Greek for the present), (3) Modern Languages, (4) Philosophy and History, (5) Pure Mathematics, (6) Applied Mathematics and Physics, (7) Chemistry and Metallurgy, (8) Law, (9) Botany, (10) Geology, (11) Zoology. Temporary class-room accommodation has been secured, and the question of permanent buildings is being seriously discussed. It is hoped that the new term will see a considerable increase in the number of students.

But much more important than this addition to the collegiate foundations of South Africa is the Bill that is being introduced to provide for the establishment of School Boards, and for the better management of education throughout Cape Colony. We give the substance of the chief clauses in an abbreviated form. The Governor may by proclamation constitute any area a school district, and within twelve months every part of the Colony is to be included in a school district. Every fully proclaimed school district is to be under the jurisdiction of a Board consisting of such a number of members, being a multiple of three, not less than six, and, not more than eighteen, as the Minister of Education shall determine. The members of the School Boards are to be, as to one-third, elected; as to one-third, nominated by the Governor; and, as to one-third, nominated by the Divisional or Municipal Council. Women are eligible for the Boards, but teachers in schools or institutions managed by a Board are not eligible. A School Board is to have the power of establishing such schools as may be approved by the Education Department, provided that *all such schools shall be strictly undenominational in character*. It is to be lawful for the first School Board or its successors at any time after the expiry of its first year in office to make school attendance compulsory for all children of European parentage or extraction within its district who have completed their seventh but not their fourteenth year, provided this is done at a meeting specially called for the purpose, and whereat not less than two-thirds of the members are present.

NEW SOUTH WALES.

ROYAL COMMISSION ON SECONDARY EDUCATION.

The long expected second report by Messrs. Knibbs and Turner, the New South Wales Royal Commissioners on Education, dealing with secondary education in the Mother State of Australia, was issued on October 12 at Sydney, and has justified, in the opinion of our correspondent, all the hopes built upon it. The report is, in fact, a wholesome condemnation of the backwardness of New South Wales in the provision of public secondary education, and a stimulating body of suggestions and recommendations in the direction of an enlightened policy for the future. The Commissioners point out that in Sydney, with a population of over 450,000, there are only two public schools, and in the whole of the country districts only two more—the total enrolment in the whole four high schools being below six hundred! They compare this state of things with the town of Detroit in America—about half the size of Sydney—which has three public high schools and thousands of pupils; and with Germany, where every small city has three or four great types of secondary schools. "It is," the Commissioners boldly declare, "no exaggeration to say that in the matter of secondary education we have no place among the nations."

The Commissioners' recommendations include the erection of two new and up-to-date State secondary high schools near Sydney—one for girls and the other for boys. They also urge the building of a high school after the model of the *Oberrealschule* of Germany, or that of one of the latest American high schools. This establishment, Messrs. Knibbs and Turner plead, should be in two blocks to separate the sexes, but with laboratories and workshops common to both, to be used at different times of the day.

The New South Wales Government is hard pushed for money for any purpose just now—the State Treasurer's latest retrenchment scheme aims at cutting down annual expenditure by over £900,000—so will not look with pleasure on these proposals. Public opinion and the Press may, however, compel the Government to carry out the report and make the necessary savings in other directions. The *Sydney Daily Telegraph*,

which has done so much to popularize information concerning the new State School syllabus with its courses in "Civics," and has exposed so successfully the vending of bogus American degrees in Sydney, is bound to throw in the weight of its influence on the side of the secondary educationists. Nowhere in the world is the daily press such a power as in Australia. It made the Carruthers Government now reigning in Sydney, and the Government must obey or be dismissed.

SWITZERLAND.

Whether children should give any, and if so how much, time to the preparation of lessons out of school is a question ceaselessly debated in educational circles. Readers may therefore be glad to have an abstract of the principles adopted by the Synode scolaire cantonal of Berne. 1. In the first school year no tasks are to be done at home; in the second and third years no *written* tasks. 2. In the higher classes of primary schools, in middle schools, and in connexion with religious instruction, no *written* work is to be done at home. An exception is made in favour of composition in the mother tongue when the pupils are above the ordinary school age. 3. When the teaching is in the hands of different masters, they must arrange so that lessons are distributed equally over the days of the week. 4. There must be uniformity throughout the year, and no increase towards the end of it. [As we might put it, no extra work is to be imposed when examinations are approaching.] 5. The amount of home-work exacted should be reduced to a minimum. The domestic claims on a pupil should be taken into account, and physical or intellectual weakness admitted as an excuse for the non-performance of tasks. 6. No preparation may be required for manual work or drawing, or for optional subjects; nor may work be set in the morning to be shown up in the afternoon. Holiday tasks are also inadmissible.

TEACHERS' GUILD NOTES.

[By a resolution of the Council, of June 19, 1884, "The Journal of Education" was adopted as the medium of communication among members of the Teachers' Guild; but "The Journal" is in no other sense the organ of the Guild, nor is the Guild in any way responsible for the opinions expressed therein.]

MEMBERS of the Teachers' Guild mustered in force on Friday evening, March 17, at Bedford College, W., to hear a lecture from Canon Beeching on "The Spiritual Teaching of Shakespeare." Dr. S. H. Butcher, Chairman of the Council of the Guild, presided and introduced the lecturer. Canon Beeching began by meeting the Puritan objection that Shakespeare, as a playwright, and, worse, as a play-actor, could not be looked to for spiritual teaching. But why do Puritans abhor the drama? Mainly because it represents passions, and passions, on the whole, are immoral. The passion of love is specially prominent in drama, and a corrupt treatment of it culminated in such plays as some of Beaumont and Fletcher's and the Restoration drama, which are now found to be unreadable. Love, however, is not the dominant motive in most of Shakespeare's best plays, such as "Hamlet," "Macbeth," "Lear," and "Coriolanus." It has been urged that Shakespeare was too artistic to have anything to do with spiritual ideas; but true artistic presentation must be an interpretation, not merely a reproduction, of Nature. But what of a *dramatic* poet? In looking for Shakespeare's opinion on spiritual questions we must watch the character of the speaker, and not attribute to the poet all the views put forth by his characters, as is the wont of collections of "Beauties of Shakespeare." Canon Beeching showed how we could get at the poet's own opinions, and quoted the speeches of the Duke at the end of "Measure for Measure," pointing out how they might fairly be taken to express Shakespeare's view. We can, however, get back, in Shakespeare, to something more fundamental than single expressions of opinion. He has told us that the art of the actor is "to hold the mirror up to Nature." How, then, did the world look to him? It appeared to him as a *spiritual* world. His characters are moral creatures, exercising freedom of will. Fate is not prominent in Shakespeare. The spring of action is in a man's own desires, e.g., Banquo shook off the suggestions of the witches, and the dead Hamlet's ghost was powerless to touch the springs of his son's will. Again, Shakespeare's men and women are people with consciences. The tragedy of Hamlet, Brutus, and Macbeth is nothing at all if not a spiritual

tragedy. Hamlet is the tragedy of a brooding intellect, divorced from will. The defect of Brutus is not in will, but in moral judgment. In moral purpose his stature is heroic. In the character of Macbeth an æsthetic appreciation of human life is drawn clearly. Macbeth is a poet, but has not the point of view from which actions are considered as simply right or wrong. In the comedies, of course, there is not the same high type of spiritual teaching, but there is a good deal of such teaching. Malvolio may be compared with Brutus in certain aspects, Jaques with Hamlet. In "Henry V." Nym and Bardolph are both hanged. Falstaff's case is different. We laugh with him as well as at him; but he was disgraced. Women are very prominent in Shakespeare's comedies. Through them the poet gives us his large, sane ethical teaching. They represent the ideal of good living, right thinking, and sound sense as opposed to folly. Isabella, in "Measure for Measure," is the most striking instance of this. Shakespeare's sympathies clearly lie on her side. Canon Beeching concluded his lecture with a reference to the great romances "Winter's Tale," "Cymbeline," and "The Tempest," with their dominant note of forgiveness of injury and reconciliation following on penitence. Mr. J. Newby Hetherington, Chairman of Committee of Section D, London Members, proposed a cordial vote of thanks to the Lecturer, and was seconded by Miss Gavin. The vote was carried by acclamation. Another vote of thanks to the Chairman and to the Principal of Bedford College, proposed by the Rev. H. Wesley Dennis, Vice-Chairman of Council of the Guild, was also passed. The name of Miss C. A. Burns, Hon. Sec. of Section D, on whom fell the main burden of arranging for the meeting, deserves very honorable mention.

MEMBERS of the Guild will have another opportunity of enjoying a lecture from Canon Beeching after the Annual General Meeting of the Guild on May 30. The lecture—title not yet communicated—will be given in the Botanical Theatre, University College, Gower Street, London, W.C. This lecture will stand in the place of the usual Presidential Address, which the Master of University College, Oxford, President for the year, is unable to give.

OBITUARY.

AUGUSTUS AUSTEN-LEIGH.

LAST month we recorded the death of the Provost of King's College, Cambridge, which occurred on February 25, too late for us to add aught to the bare announcement. The death was sudden and unexpected, caused by an attack of angina pectoris, of which there had been no warning; and it came as a shock not only to the college which he had ruled so firmly and lovingly for nearly a quarter of a century, but to the whole University in whose affairs he had for the last ten years taken a leading part.

Augustus Austen-Leigh was born in 1840, a younger son of the Rev. J. E. Austen-Leigh, Vicar of Bray and a grand-nephew of Jane Austen. He was educated at Eton, whence he passed to King's College, being elected successively Scholar and Fellow. Shortly after he was ordained deacon, and for two years was curate at Henley-on-Thames. Returning to college, he was Tutor from 1867 to 1881, an eventful period which witnessed the transformation of King's from a close preserve of Eton to an open college which holds as high a rank at Cambridge as New College does at Oxford. In 1889 he succeeded Dr. Okes as Provost, and for the eight preceding years, in consequence of the failing health of the octogenarian Provost, as Vice-Provost he had virtually been Regent of the college. From 1893 to 1895 he was Vice-Chancellor of the University. In every department of University life he took a keen interest and was, till his death, President of the University Cricket Club. In educational politics he was a liberal and one of the signatories of the Syndicate's Report recommending alternatives for Greek.

Of his personal character Mr. Oscar Browning gives, in the *Cambridge Review*, some characteristic traits. Engaged to be married before the Provostship was vacant, he carefully concealed the fact of his engagement for fear it might influence the mind of the electors. When the college had lost a considerable sum of money by a defaulting solicitor, for which the Provost was only technically responsible, he insisted on refunding the debt in spite of the reluctance of the college to receive it. Mr. Browning well portrays him as "one of the purest and gentlest spirits that ever took a prominent part in University affairs."

SYLLABUS OF GEOGRAPHY LESSONS GIVEN IN A LANCASHIRE VILLAGE.

THE following suggestive syllabus is sent us by the late Head Mistress of a rural high school. The ages of the pupils to whom the lessons were given ranged from eight to sixteen:—

1. *Plan of Schoolroom*: position of windows, door, fireplace, and chief articles of furniture. One window faced E.; three faced S.; hence course of Sun was followed by the drawing down of successive blinds, and the points of compass were drawn on floor.

2. *Plans of large School Garden*: various parts taken separately, especially of the children's plots.

3. *Plan of Village*: (a) the main roads, meeting at the Village Cross; (b) turnings out of above; (c) site of chief landmarks—School, Church, Village Cross, Public Hall, &c.; also several pupils' homes.

4. *Outskirts of Village*, whence some pupils came in to school, and others often visited: (a) the chief roads leading out of the village to neighbouring districts; (b) comparison with the railway cuttings wherever these crossed or coincided.

5. *Bird's-eye View from Church Tower*: (a) view from same; (b) rough plan of chief directions; (c) identification of pupils' homes, village landmarks, and distant places; (d) comparison of views from different sides of the square tower—hills to the S.E., flat plain, declining to the sea on W.; (e) winds—(i.) their force at a height, and on the ground; (ii.) direction, as seen from the fluttering flag on the tower and the curve of the trees.

6. *School Excursions*: walks in neighbourhood by road and field; plan drawn of route; notes made to show rising ground, streams and ditches, clumps of trees, variety of fields (illustrated by sketches); on return, questions asked, including position of Sun, direction of winds, shape of trees, &c.

7. *The Seaside*: being easily accessible, it was frequently visited and well known. Hence map-drawing of coast from Blackpool, N. to Fleetwood, and S. to Southport; extended to Morecambe and Liverpool; further extensions into the Lake districts of N. Lancashire. *Mouths of Rivers*: Lune, Ribble, Mersey. Character of coast—land-slips and fissures; reason for building sea wall, then in course of erection.

8. *County of Lancashire*: Philips' Wall-Map of the County was

hung in a small hall to which pupils had constant access; also the Ordnance Map of the immediate neighbourhood. (a) *Map-reading*, and identification of well known towns and villages (with their relative positions and railway connexions), first on large County Map; indication of school-house, home, church, &c., by means of small flags; neighbouring hills and rivers—traced further afield; cotton mills and towns; coal area; shipping centres. Next, transfer to Ordnance Map—trace out roads, hills, watercourses, &c., on this. (b) *Black-board drawing* of outline, a few salient features being filled in. (c) *Moulding* of the county in plasticine, showing elevations and rivers and important places thereon. (d) *Journeys* to other places in the county—e.g., Manchester, Liverpool, the Lakes, &c.

9. *Northern England*: extension of Lake district—across the Pennine barrier; other districts for coal, shipping, &c.

10. *Journeys to more distant parts of England*—e.g., to London. Route traversed; views; changes of scene.

11. *England*: position and size upon the Globe (Philips') and upon the Map of Europe (Sydow's); connexion and communication with Continent (visit to Paris Exhibition); main physical features, climate, productions.

12. *Outside England*: larger mountains and rivers; children of other lands—their ways, dress, food—hence varieties of climate and productions; exchange and commerce.

AUGUSTA BARE.

ADVANCE !

DESPAIR not, nay ! nor deem forgot
To-day thy hard-won skill,
Because the hand obeyeth not,
As yesterday, the will !

Though strong and stronger flow the tide,
Not every wave can reach
To where its bright forerunner died
In rainbows on the beach.

F. W. BOURDILLON.

FROM GINN & COMPANY'S LIST. THE BLAISDELL PHYSIOLOGIES.

A Series of five books by ALBERT F. BLAISDELL, M.D., which have obtained an extraordinary and unique position in the schools of America, presenting as they do in clear and simple language the latest and most trustworthy facts on the all-important subjects of physiology and hygiene. Simple experiments are introduced; the most approved of modern ideas on the subject of physical culture are included; and the effects of alcohol, tobacco, and other narcotics upon the bodily life are set forth clearly and forcibly before the mind of the pupil as the different topics are treated. The books are furnished with copious illustrations.

The Child's Book of Health.

A First Book of Hygiene presenting easy lessons for Junior Classes s. d. 1 6

How to Keep Well.

Simple, teachable, and replete with suggestions for Teachers 2 0

Our Bodies and How We Live.

Simple in style, with no attempt at scientific discussion; adapted for early High School work 3 0

Life and Health.

Lays special emphasis upon practical experiments and the treatment of Personal Health 4 6

OCCASIONAL NOTES.

THE Report of the Education Committee of the London County Council fell as a bolt from the blue on the London ratepayer—no *brutum fulmen*, but charged with an increased rate of 4d. in the £. It cannot, however, have surprised either the clergy or the managers of the voluntary schools. The facts are briefly these. Of the 438 non-provided schools in London, 92 are condemned as absolutely unsuitable, and 29 departments of other schools are unsatisfactory. In 342, or 78 per cent., the drains are in a bad condition. Only 64, or under 15 per cent., can be taken over as they stand with few or no alterations. The Report adds that the teaching given under these adverse conditions was highly meritorious.

IT is amusing to note the contradictory comments that the Report has provoked. Let us instance the two extremes. Here, says the *Daily Chronicle*, is the outcome of the London Education Act of 1903, passed by a Tory Government against the wishes of the County Council in order to please the clergy and perpetuate Church schools. The aggrieved ratepayer must blame, not the County Council, but the Government. See, says the *Morning Post*, what an enormous saving the voluntary schools have been to the ratepayer. The County Council sets up an ideal standard of its own, and, with reckless extravagance, condemns every school that falls short of it. If the teaching is pronounced to be sound, imperfect drains and crowded class-rooms without light or ventilation are a minor matter. The vital part of a school is not the building, but the teaching.

LET us attempt to hold the balance. A Liberal Government would certainly never have passed the Act of 1903; but the *Daily Chronicle* would not have us suppose that it would have left the voluntary schools to stew in their own juice, and, had it dealt with them, the cost could not have been less. On the other hand, the *Morning Post* has still to learn Mr. Thring's philosophy of the brick wall. In insanitary schools, without proper light and air and room both for work and play, there cannot be good teaching. All praise to the voluntary teachers who have adorned their Sparta; but the praise of the County Council inspectors is obviously relative to the conditions. It is, at length, manifest that no doles or subsidies will enable the Church to bear "the intolerable burden" that it has laid upon itself. The only sound national system of education is one that is supported by public money and placed under public control. The bill is heavy; but the sooner we make up our minds to pay it the better.

THE resolution of the East Ham Borough Council not to administer the Education Act after June 1, followed up by notices terminating the engagements of teachers, is the most serious of the many educational difficulties that the Government have had to face. Passive resisters may be sent to prison, but when a borough appears *in forma pauperis* it is impossible, even if the Act covered the case, which seems doubtful, to proceed against it by *mandamus*, and clap its councillors in jail. No educational principle is involved, and the final remedy is to be sought in a re-adjustment of rates and areas, matters which lie beyond our province. Meanwhile, the Government will be forced to do something to relieve the intolerable strain which has been brought about by their own *lâches*. If a precedent is wanted, the grant in aid of voluntary schools more than justifies a grant to starving national schools.

THE blue riband of the profession has gone to an outsider, and in our prognostics of the future Head Master of Eton we disregarded the proverb that warns us not to prophesy unless we know. It is an open secret that Mr. Arthur Benson, the only possible candidate who has won distinction outside the school world, might have had the post for the asking; that he was virtually asked and declined. Whether the loss to Eton is more than compensated by the gain to literature we will not seek to determine. If, as in a University college, the choice of a Head had been left to the staff, there is little doubt that they would have elected Mr. Rawlins. Three of the candidates were head masters who had been sometime assistant masters at Eton. It would be invidious to compare their merits, but we may safely say that, had the vote been determined by the testimony of the candidate's staff and scholars, it would have gone to the Head Master of Repton. The election suggests two general observations. It shows, notwithstanding the issue, that the ancient solitary reign of clerical head masters is over. It was an open field, and, had a layman been chosen, it would have excited no surprise. Of the present Eton staff only one in eight is a cleric. On the other hand, the old Eton tradition of endogamy, or breeding in and in, dies hard. It is true that Eton masterhips are no longer confined to King's men, but the candidature for the head mastership was confined to men who had been taught or who had taught at Eton.

CANON LYTTTELTON is a man of independent character, and he has shown the courage of his opinions. The qualities that have most commended him to the public we are not inclined to rank very highly, and what have been counted his defects we regard rather as hopeful signs.

**Canon
Lyttelton.**

On his family connexions and his prowess in the cricket and football field, the press has expatiated at length, not forgetting the part he has taken at Church Congresses. The black balls dropped into his urn have all been inscribed with "faddist." Every reforming head master, from Mulcaster and Lilly down to Arnold and Thring, has suffered the same reproach. To have taken the Cambridge Teaching Diploma is a fad; to have chairmanshiped a democratic body like the Teachers' Guild is a fad, no less than to be a vegetarian and to wear Jaeger clothing. To our way of thinking, to have published a thesis in favour of Latin verse making and to have decried modern languages as soft options are worse fads than any of these. Canon Lyttelton has learnt much, and he has still much to learn, both in the way of science and of discipline. But he has one excellent quality in a head master—tolerance and teachability. If he still maintains the classical tradition of Eton, he will not try to impose its yoke on the Army class or to interfere with the natural growth of modern subjects. Eton is, after all, a peculiar institution, an enclave, as it were, in the system of national education, and, if wisdom comes to it, knowledge will always linger.

THE Humanitarian League have lost no time in approaching the Head Master elect of Eton. They respectfully appeal to him to consider the many protests made during the past few years against the Eton College Beagles. The signatories to the letter include seven Heads of Colleges

**The
Eton Beagles.**

and eight Bishops, Lord Wolseley, Sir J. S. Burdon-Sanderson, Canon Barnett, Sir Edward Fry, and Sir John Gorst, to name only a few of the more famous. The appeal will serve as a touchstone to test the metal of the new Master. Canon Lyttelton, there can be no doubt, is at heart a humanitarian, but it needs unusual courage to attack a time-honoured institution. Public schools have ever been centres of conservatism: they retained cock-fighting long after it had fallen into general disrepute; and Eton is the most conservative of public schools.

THE private school preparing boys for the public schools has hitherto escaped much of the criticism that the public is pouring out upon educational institutions generally.

**Preparatory
Schools
at the Bar.**

But its turn has now come. The report of the committees appointed to interview small boys for admission to the Royal Naval College at Osborne reads almost like an inspector's report on the schools which send up the candidates. Dr. Burge, for example, thinks it well to let it be known that the examiners pay very close attention to the general efficiency of the school from which the candidate comes. Do we understand then that the oral examination consists in cross-questioning the boy upon his school? Surely Dr. Burge's idea is wide of the mark. The duty of the Interview Committee is to decide, so far as possible, whether the candidate will make a good naval officer, and not to criticize his school. Their's to judge the result and not to investigate the process. Mr. Vincent Baddeley suggests that in time it may be possible to issue a list of efficient preparatory schools. Mr. A. C. Benson is amused at the transparent attempts at cramming, and thinks that the only satisfactory way in which boys can be pre-

pared for such an examination is "to teach them thoroughly and sensibly." Would Eton in Mr. Benson's judgment satisfy this test? One and all the examiners applaud the new system and speak of it as a complete success. What is to be feared is that it may degenerate into something akin to the ancient system of pure patronage.

THE long reign of Queen Victoria, showing that a woman can govern wisely and well, seems to be bearing fruit in the increasing willingness of our legislators to admit women to a share in the control of local affairs. A large majority in the House (171 to 21) voted for the second reading of the Bill which would make it possible for women to serve, on the same conditions as men, on County and Borough Councils. The arguments adduced against the Bill were twofold: the permission thus given would be a stepping-stone to the parliamentary franchise; and it was not fitting for women to undergo the unpleasant ordeal of election to a public body. The first objection will be to many an argument in its favour, and will have little force with those who have for thirty years allowed women to sit on School Boards. The second objection is met by the simple statement that the Bill does not make it compulsory upon any woman who prefers the fire-side and the drawing-room to enter the public arena. Prior to the Act of 1902, women were an undoubted source of strength to the School Boards. The present Bill is designed to remove the disability caused by the Act. Mrs. Craigie thinks, or pretends to think, that women can neither "see straight" nor weigh evidence. Let her take heart of grace. When the Bill passes there will still be men enough on the Councils to keep the sympathetic sex in the strait way. It is true that men and women do see differently; men object to have to justify their arguments and to meet those of women. But time will accustom them to the idea; and a future generation will wonder at our intolerance.

THE Clerk of the Privy Council has written to the promoters of a University for Sheffield, intimating that the Committee of the Privy Council have decided to recommend the King to grant a charter incorporating a University in Sheffield. Large sums of money have already been given or promised for endowment, and the City Council have pledged themselves and their successors, so far as they have that power, to allocate to the new University the produce of a penny rate. This sum capitalized would amount to £200,000. The new buildings in which the scattered schools of the University are to be united will be opened in a few months. Sheffield is to be congratulated. Its University College has already won for itself no small reputation. The equipment of the Metallurgical Department of the Technical School is said to be as good as any in the world. Perhaps the most interesting and remarkable feature of the movement is the proof it affords that the business man in Sheffield is convinced of the value of University education applied to industries. For the new University is not to be academic merely in the old sense. In addition to the Arts course, the University will have power to grant degrees in Science, Technology, and Medicine.

IT is not probable, or, at least, as we are informed, it is not provable, that we are provided at starting with less good teeth than our ancestors of, say, a hundred years ago. What is capable of demonstration is the fact that teeth now are apt to decay at an unduly early age; the result, as the

Teeth.

authorities inform us, of the food-stuffs that are now eaten. It may be that, if we habitually ate (and masticated) raw apples, celery, tough beefsteak, and the like, it would ensure us against the interference of the dentist. But, under the conditions as we find them to-day, it is clear that children suffer in many ways, and not merely from the temporary pain of tooth-ache, because their teeth are neglected while they are young. We read of a tooth-brush drill in parts of Germany. This is an example we shall have to follow. But this will not be enough. Medical inspection of children in the elementary schools must be accompanied by dental inspection. In the long run the nation would save by making the care of the teeth an essential part of schooling. Certainly the benevolent public would profit. A case in point can be quoted. A youth who had been educated by a philanthropical society was to be shipped to a colonial farm, and was sent, as a preliminary, to a dentist. Every tooth in his head had to be taken out and an artificial set provided, at the cost, of course, of the subscribers to the society. Expert opinion declared that the calamity was entirely the result of early neglect. The case is by no means, we are informed, exceptional. It is a penny-wise policy that grudges the expense of seeing after the health of children in the elementary schools.

THE reception that the Bishop of Hereford's School Continuation Bill met with from the Government is not a hopeful sign. The Bill, as we explained last year, is of a purely permissive character. It authorizes Local Authorities to start evening schools or classes and to compel the attendance of pupils up to the age of sixteen to the extent of seventy-five hours a year. As Sunday attendances are allowed to count within the limit of a third of the total, this means an hour a day for eight weeks in the year—an extremely modest proposal if compared with what is required in Switzerland. What has the President of the Board of Education to say to it? He allows the Bishop's premisses, enforced by the Archbishop. He regrets with them that on half the pupils who leave our elementary schools their schooling leaves no permanent impression whatsoever; but he cannot support the Bill because "it introduces a principle of compulsion and throws an extra burden on the already overburdened ratepayers." What, then, was his alternative? None, save a promise "to give the Bill his most careful consideration with a view to finding some solution." "Le Marquis s'aviserà."

DR. PERCIVAL could not have expected his Bill to pass its second reading or he would not have urged Clause 4, which allows attendance at a Sunday school to count up to one third of the number of attendances required. However reasonable such a proposal might be, the bishops could only see in it a movement towards the secularization of the Sabbath. If the clergy would sometimes deny themselves the privilege of attending morning service, and would take their walks abroad, where men—and women—most do congregate, they might arrive at the conclusion that for the bulk of the population Sunday is already secularized, whatever that may mean. Sunday schools have lost their influence over the majority of children because they are conducted in such an inefficient way. In secular education we have made progress in the last forty years: Sunday schools remain as they were—the teachers only too often illiterate and untrained; discipline entirely wanting; the children bored or mischievous because their interest is not aroused. To remedy the latter evil a system of bribes has

been introduced. But is there really any sound reason why Sunday schools should not be reformed, and why, on the one day of leisure, a genuine attempt should not be made to teach morals and religion? Why should not history and civics be added? The answer can only be in the negative so long as Sunday schools exist mainly to hear collects and to give rewards.

ALL teachers must welcome an ally like Mr. T. C. Horsfall, whose disinterestedness is beyond suspicion. Last month we noticed his views on religious teaching in schools. Now we have from him a paper read to the Manchester Branch of the Teachers' Guild on "The Representation of Teachers on Education Authorities." He sets down the comparative failure of our school system since 1870 mainly to the disregard of expert opinion. "Our system of school government by untrained inspectors and untrained managers has caused a disastrous loss of time and health in the last thirty-four years, in which, under a better system, vast progress would have been made." Inspectors are now required to have had some practice in teaching, and it is admitted in principle that there should be some representation of teachers on Local Authorities; but this is not enough to satisfy Mr. Horsfall. It is essential that all the chief types of schools in a district should be represented, and, further, that the representative of each type should be in close touch with his constituents, so that he may make known what are the best methods in use and advocate methods for raising all schools to the highest level attainable. Mr. Horsfall clinches his argument by showing how, in Hamburg and in Zürich, such a scheme of co-operation between the municipalities and the teachers has been carried out with the happiest results.

THE *Cornhill Magazine* for April has a striking article on "Compulsory Classics," by An Outsider. Mr. John Collier writes as an onlooker, neither a schoolmaster nor a man of science, one who has nothing to do with education and has had very little of it himself. But, as the article shows, Mr. Collier knows what he is talking about: he was educated, or not educated, at Eton; he has followed closely the Greek controversy. The principle he starts with is that schools exist for the average boy, and out of the mouths of the "Greeks" themselves he shows that, judged by this standard, our public schools are a failure. The average man of the upper classes, who is just the average public-school boy grown up, "seems entirely uninfluenced by the classical culture that he has spent so many years of his school life in acquiring." Dr. James's contention that Greek should be enforced on all alike in order that the *élite* may profit by it is denounced as immoral. Mr. Collier does not mince his words. Dr. Gow's contention that even a smattering of the classics imparts an air of gentility which is lacking to the Modern-Sider provokes the retort: "Oh! these schoolmasters! Whatever else a classical training does, it does not seem to develop a sense of humour, nor does it seem particularly favourable to the logical faculty. To the outsider it seems scarcely ingenuous to get all the clever boys to follow one line of study, and then to point to their cleverness as a proof of the superiority of the study." The article, to be appreciated, must be read as a whole, and we must content ourselves with quoting one delightful anecdote. Prof. Huxley once gave a lecture to the boys of Harrow School. "An eminent classical master was met by a friend as he came away from the lecture. The classicist explained his presence

at the lecture somewhat apologetically with the words: 'I just went to see what this natural science was like. There's nothing in it.'

THE Committee of Council on Education in Scotland has issued an important minute providing for the establishment of Committees for the Training of Teachers.

Training in Scotland.

Four Committees are to be constituted in connexion with the four Scotch Universities, and to these will be paid from and after July 31 the grants for the training of King's Students. It will be the duty of each Committee to provide courses of training, primarily in connexion with the University, but as to this, with the sanction of the Department, they are given full discretion. They may, further, take over any existing training college, with the proviso that its denominational instruction shall be maintained. The Committees are variously constituted, but we may take Edinburgh as a type: University members 5, University colleges 2, School Boards 18, secondary schools 3, co-opted 3, with the Chief Inspector of the district as assessor. The scheme is broad and democratic, and our only doubt is whether the promised subsidy from the general aid grant will meet the certain deficit, if it is effectively carried out. Dover House acts while Whitehall considers, or pretends to be considering, the question of training.

THE medical profession has undertaken to educate the Board of Education. We wish it godspeed. But the task is no light one. The petition signed by some

The Use of Alcohol.

fifteen thousand doctors, urging the Government to secure that true notions about the use of alcohol are taught in the elementary schools, will remain ineffective in its pigeon-hole, unless steps are taken to force the matter persistently upon the Board. It is an undoubted misfortune that any one who attempts to teach abstinence from alcoholic drink should, in the public mind, fall into one of three categories—he is a hypocrite, for he indulges himself; he is a temperance crank who misunderstands the earth's gifts; or he is interested pecuniarily in the sale of some kind of temperance drink. Our medical advisers have much leeway to make up; for it is not so long ago that the action of alcohol upon the human body was misinterpreted and a false doctrine preached. Two prevailing errors can, at any rate, be corrected if the doctors wish. And they have lately met in conference to that end. We are not speaking here of the use of alcohol as a drug in sickness: but of its habitual use by healthy persons. The first common error is that alcohol keeps one warm. This is absolutely disproved by science; though this is not the place to give the technical proof. It is sufficient to say that alcohol, while causing a feeling of warmth on the surface of the skin, in reality lowers the temperature of the body. In the second place it has been proved by experiments in psychological laboratories that alcohol weakens the mental powers in normal conditions. Most people believe the contrary. Dr. Saleeby in the *Academy* for April 1 deals with this matter.

IS the policy of giving secondary education to all comers below cost price economically unsound and indefensible? Such is the question raised in a letter to the *Times* under the signatures of Sir George Bartley and other public men. Their answer, needless to say, is a categorical negative, but to us it does not seem so simple a matter. No education, if we except private tuition, is wholly self-supporting. Secondary education in the United

States is gratuitous; in all European countries it is largely aided either by the State or locally; English public schools benefit by the pious founder, and noblemen and M.P.'s feel no scruple about entering their sons for Eton or Winchester scholarships. It is the lower middle class, the poor professional man and the tradesman, who (as another correspondent puts it) are being ground to powder between the upper and nether millstone of the rich and poor. They have to pay for the free schooling of all below them in the social scale, and of some who are really better off than themselves, and the provision of day schools is lamentably defective. It may be true, as Sir G. Bartley urges, that the new county schools are tending to deplete the cheaper boarding schools, but for the vast majority of those we are contemplating—parents who can claim reduction on the income tax—boarding schools are out of the question, and we have yet to learn that these day pupils are worse taught than the boarders. The *gravamen* of Sir G. Bartley's charge is that private enterprise is being driven out of the field. We should grieve as much as he at the extinction of private schools, but we do not believe it. The more education is democratized the greater will be the demand for "ladies' colleges" and "academies for young gentlemen." Witness America.

A CORRESPONDENT, referring to the qualifications of the officials of the Board of Education, points out that, although the hard-fought battle for the recognition of

"Examiners."

educational experience in the appointment of inspectors has been at last won, the qualifications of the "examiners," junior and senior—the superior officials of the Board—are called "examiners"—still leave much to be desired. On the secondary side there is a plethora of lawyers, with the inevitable result that all the publications of the Board show a legal, rather than an educational, bias. It seems almost incredible that, among the secondary staff at Whitehall, there is scarcely a single official who has any qualifications in science and art; but such, unfortunately, is the case. The Board of Education was excluded from the Government offices which secure their officials through the Civil Service examinations, in order that men of special knowledge and experience might be appointed. It was certainly not the intention of the Government that raw and inexperienced youths, fresh from the University, should enter the Civil Service through a back door.

BEDFORD COLLEGE FOR WOMEN celebrated its jubilee six years ago. It has justified its claim to public support by continuously widening and deepening its

The Claims of Bedford College.

educational work, particularly that of training teachers. The lease of the premises now occupied is approaching its term and the landlord declines to sell the freehold. To enlarge the College on its present site is, therefore, inexpedient. A new site has been found, and, so soon as the necessary funds are provided, it is proposed to build a new college to accommodate double the number of present students. Land is not cheap near London, and the sum of £150,000 is required for site and building, i.e., about £300 capital expenditure per student. This does not seem an extravagant estimate. In addition, as the fees paid by students together with the Treasury grant fall short, as is inevitable, of the cost of maintenance, a sum of £100,000 is asked for as endowment. Bedford College is a school of the University of London. Its claims are endorsed by the Senate. They will, we feel very sure, be further endorsed by the public. We prefer in England to pay our money for

such objects in the form of voluntary subscriptions rather than under the head of taxation. Not many of our readers are millionaires, and the appeal for funds is better made in other quarters; but our readers are interested in the higher education of women, and we offer for what it is worth our cordial approval.

"LIBEL Action against a Head Master" is a telling headline for a newspaper, and more notice has been taken of the case *Blind v. Spenser* than it seems to merit. The facts are simple. A youth who had just left University College School wrote a letter to the *Morning Post* reflecting on the school authorities with regard to the school cadet corps. Dr. Spenser asked the plaintiff to come and see him, an offer which the plaintiff declined, requiring, instead, a public reply, with needful precision, to his letter in the press. To this Dr. Spenser replied, characterizing Mr. Blind's conduct as unworthy of any one professing to be a friend of the school and a gentleman, and posted the letter on the school notice board. Mr. Justice Lawrence held that the occasion was privileged, and the jury found there was no malice and that the way of bringing the matter before the boys' notice was reasonable. That Dr. Spenser was fully justified in forbidding the boy to enter the school premises is obvious; but we think it would have been wiser to have taken no further notice of the "cheek" of an emancipated schoolboy.

LOCAL AUTHORITIES.

Scholarships in Middlesex. THE Middlesex County Council has now issued its revised scholarship scheme. All candidates, as before, will undergo a paper examination in the ordinary subjects. Those who are reported by the examiner as being up to scholarship standard, or, in the words of the report, "who have reached a degree of attainment which justifies their transfer to, or retention in, secondary schools," will be further examined orally by a Committee. This Committee will consist of an examiner appointed by the Authority, a head master and head mistress of elementary schools, and a head master or head mistress of a secondary school. The oral examination will be designed to test candidates in reading, in mental arithmetic, and in general intelligence. The Committee will arrange the children in three classes—good, fair, and unsuitable. With the results of the double examination before them, the Education Committee will make the final award. There are fourteen scholarships for boys and seven for girls. These cover the cost of school fees, together with a maintenance allowance varying from £6 to £10. In addition, there are thirty exhibitions for boys and fifteen for girls, covering school fees only. The pupil-teacher scholarship system is kept quite distinct. There will be twenty-five for boys and seventy-five for girls. In all the scholarships each Parliamentary division has its due proportion assigned; but, failing a candidate of suitable ability, the scholarship will be awarded irrespective of locality.

L.O.C. Scholarships. PREPARATIONS are being rapidly pushed forward for the huge examination for the London County Council Junior Scholarships. Over twenty thousand candidates are expected to compete. These will have been nominated in the first instance by the heads of elementary schools. They will then be examined on paper in arithmetic and English composition. To carry out this task, Dr. Foat, assistant master at the City of London School, has been appointed chief examiner, with twenty assistant examiners under him, whose marks he will be required to coordinate. The results will be presented by Dr. Foat to the Board of Examiners. This Board consists of three officials—Dr. Garnett, Mr. Blair, and Dr. Kimmins, four representatives of London schools, and two of the examiners in addition to Dr. Foat. The Board will also have before it reports on candidates from the Committees, one for boys and one for girls, in each electoral division. Further, there will be the school reports based on the school examination and the head teacher's opinion of each candidate. Several important questions present themselves: Will cramming be prevented by the limitation of the paper examination to two subjects? On what grounds will the Local Committees make their recommendations? In what sense will

the phrase "deserving candidate" be understood? Can the Board adjudicate on such an enormous number of candidates except in a purely mechanical way? Time and experience alone can answer these questions.

11½d. in Surrey. THE rumour that the elementary education rate in Surrey was likely to reach 1s. caused some perturbation in the county, and the Chairman (Mr. Halsey) thought it expedient to summon a conference to hear the defence of the Education Committee. The attendance was not large, and no real attempt was made to prove that the Committee had been extravagant. One protestor was shocked to find the son of his coachman studying Euclid. Of course, it is cheaper to teach Euclid than gardening. On the whole, the conference went to show that Surrey is not really dissatisfied with the work of the Committee, though it is naturally the proper thing to be amazed at a shilling rate. Mr. Chapman, Chairman of the Education Committee, explained that the rate would be 11½d.; that 1½d. was for the purpose of providing a working capital; that the expenses connected with the training of teachers had been, so far as possible, assigned to higher education; that the rise in the rate was to provide twelve new schools with some ninety teachers; that cookery, manual instruction, medical inspection, and physical training were all necessary and all cost money. Furthermore, the voluntary schools in Surrey were understated and underpaid. We fear the ratepayers must make up their minds to a still higher rate in the future; but they will get the due return for their expenditure in time. Surrey also raises 1½d. for higher education; but this fact has apparently been overlooked by the cavillers.

The 2d. Limit for Higher Education. A DOUBTFUL clause in the Education Act has been interpreted by the Local Government Board to mean that any increase in the 2d. rate for higher education must be justified and must be definite. They will not give permission in general terms for an increased rate; but will only sanction an increase of a definite amount after full justification for the proposed expenditure has been adduced. The point has arisen in reply to a question from the Cheshire Education Committee. The Board think that due regard must be paid to the ratepayer; and that before an increased rate is sanctioned a local inquiry should take place. Due notice of this inquiry should be circulated in the county, and a full statement should be prepared showing in detail how the funds at present available for higher education are being spent; what is the need for further outlay, and exactly how much money is to be spent and how it is proposed to spend it. The Board thinks that the existing rate, together with the money provided by the Central Authority, should prove sufficient to cover the cost of the gradual development of secondary education. But it is not clear that the Board realize that the increase asked for is probably to cover the expenses in connexion with the training of teachers. In this direction there must be a very large increase of expenditure, unless the Treasury shall be convinced that these charges ought to be national and not local.

Secondary Schools in London. THE London Education Committee report that there is immediate need for increased provision of secondary schools in London, especially for girls. In the report, private-venture schools are practically ignored. It is merely stated that there are many private schools as to the efficiency of which little is known, and that there are no figures to show what number of pupils they provide for. Private schools are to blame for this. Had they sought Government inspection, they could not have been altogether ignored. And, indeed, the London Committee, however much they would prefer to have all schools organized under their regulations, will not be able to clear the field entirely of private schools. It will be wiser to make an inquiry, and to recognize those that are efficient and are willing to work in accordance with the county scheme. Another class of children—those attending schools at the seaside or in the country—cannot be accurately estimated; so that the figures given are incomplete. The Committee report that there are eighty-eight secondary schools for boys and girls within the county. These are attended by some 30,000 pupils, of whom 2,000 are Council's scholars. It is estimated that provision ought to be made for 55,000 pupils. The cost of the new schools will fall mainly on the Council. Unless immediate preparations are made there will be a difficulty in finding places for the Council's scholars in September next. One private school has offered to hand itself over without condition to the Council. This offer is recommended for adoption. No doubt more schools will follow this example; but the proprietor or head teacher must run the risk of dismissal in the future—an undoubted hardship.

Northants and the Board. THE Northamptonshire Education Committee has raised a pretty hornet's nest about its ears. It seems that the managers of the Marston St. Lawrence school have been accustomed to allow the children to go to church on certain occasions. This action aroused the protest of the

Education Committee; but the managers, relying on Circular 512, continued the practice, but ordered one teacher to remain in the school to look after those children who did not go to church. Correspondence was of course proceeding vigorously between the Committee and the managers. Suddenly, however, the Committee broke off the correspondence, sent down an inspector, who declared the school closed, transferred the teachers to other places, and instructed the children to attend a school about a mile away. It passes comprehension how the Committee could for one moment hold such action to be legal. They have no power under the Act to close a school, but only, on due cause proved, to refuse to maintain the school. They have no power to transfer teachers appointed by the managers without the consent of the managers. They have put themselves in the wrong, and, by order of the Board of Education, the school has been re-opened and the teachers brought back. The action is greatly to be regretted, because it gives an opportunity to the advocates of denominational education to talk of the intolerance of the Local Authorities. This opportunity will be made the most of by the religious papers. The County has quite sufficient legal power without going beyond the Act.

SOME CHILDREN'S IDEAS OF AN IDEAL SCHOOL.

STEVENSON said somewhere that every book is, in an intimate sense, a circular letter to the friends of him who writes it. And, if this be true of the work of fully developed and mature minds, it is immeasurably truer of the simple self-revealing attempts at composition of children. Much, no doubt, can be learnt from them and of them in oral work; but in some cases where sensitiveness and reticence are early developed more can often be discovered from written work, provided, of course, that the subject chosen is one in which the children are keenly interested. It is wise, therefore, for the teacher, whenever possible, to leave the choice of subject to the class.

A lesson on the life of Sir Thomas More was very naturally the means of calling forth the eager suggestion that the next subject for composition should be "An Ideal School." At eleven years of age school is naturally a subject of absorbing interest, but for all to write about the same would be distinctly dull, whereas an ideal school suggests delightful possibilities and allows the imagination unlimited scope.

Locality was treated of first by all, and here it should be said that the school to which the children belong is in a large manufacturing town. Nineteen out of the twenty children chose the country! The twentieth considered "a pleasant suburb" (*sic*) a good situation, and explained afterwards that she thought in that case the benefit of visits to art galleries and museums would not be lost. Her school, however, was to be "near a river where a great many flowers grew, so that the pupils could study botany." The river in her own town is jet black, and wild flowers are rare indeed!

The next shows plainly the influence of the geography lessons. "It should be in a beautiful valley between ranges of hills and looking westward, between the hills might be seen the beautiful blue of the Mediterranean Sea." "How difficult it is to do lessons when one is not well," she adds, "but under that beautiful Italian sky, no one could but feel well!"

"My school," says another, "should be of white marble so that the sun would glitter upon it," and one or two others are of the same opinion, showing, no doubt, a reaction from the dull red brick to which their eyes are accustomed, and a recollection of the buildings of Italy, of which they have been told.

The difficulty of ventilating her own class-room calls forth the decidedly cutting criticism from another, that "the rooms should be heated by fires, and the windows should open at the top."

"The lessons should be those that you get in high schools." All are agreed that the subjects taught in an ideal school should be those that they themselves learn. One girl, however, would leave out French, and the same girl would reduce school hours in the morning by two hours! Another makes the pertinent suggestion that "for natural history *live* things should be shown."

Regarding punishments there is a consensus of opinion. All

agree that it would be extremely desirable to be able to do without them, but the majority consider them necessary and are extremely severe in their strictures. "Talking in class" is to be punished by leaving the delinquent alone for three days; for disobedience, a girl must be sent away from the school; and loitering on the way to school must be severely punished. The amusing thing is that each condemns the special fault for which she has been punished in time past.

The teachers receive a fair amount of criticism. They should be "young and as pleasant as could be found," "excellent in their methods of teaching," "kind and patient," and evidently ready to devote their whole lives to their pupils. One goes so far as to say: "Our teacher shall be our mother, and shall be with us always."

Children of eleven are perhaps too young to recognize that, after all, the idealism of a school depends to a great extent upon themselves. There are few suggestions made with regard to the pupils, and those that are given are directed to their appearance rather than to their manners and morals. They should be "pretty and dainty," "dressed in white in summer," "have clean clothes and wear gloves" (here a slight confusion between an ideal and a charity school seems to have crept in).

It is extremely entertaining to notice that there is a decidedly hopeful view taken concerning the progress of education. Many conclude by expressing the pious wish that *their children* may go to such a school as they have described.

THE COMPARATIVE VALUE OF HOME AND CLASS WORK.

(Continued from page 300.)

THE question of the value of isolated work as compared with class work having been solved in favour of the latter, it remained to carry the investigations into the more complicated problem of home work proper. Without the preceding experiments most teachers would undoubtedly have been inclined to account for the inferior quality of home work by the disturbances occurring in the home, or from the fact that the child worked without help. It was therefore necessary to inquire carefully and minutely into the circumstances under which the children worked and to compare work done amid disturbances at home with work carried out under the usual disturbances in class.

The first strictly controlled comparison of school and home work was carried out by Dr. Fr. Schmidt in Würzburg. His first care was to discover the general influence of home surroundings on the work of the child. He found that, as a rule, the work of the younger children only was controlled by the parents, and that the conditions of the home proved unfavourable in the great majority of cases.

To facilitate comparison, the children were given exercises of the same difficulty and length as those done at school. A comparison of the work done at home with that done in class showed a far greater number of mistakes in the home work, the numbers being as follows:—

Missing words in home work, 54; in class work, 30.

Missing letters in home work, 68; in class work, 34.

Superfluous words in home work, 8; in class work, 11.

Superfluous letters in home work, 10; in class work, 11.

The psychological reasons for the difference in these numbers are: the irregular work, uneven concentration, numerous disturbances in home work, and a more than normal concentration and over-zealousness in class. The results arrived at show that home work is decidedly poorer in quality than class work, and this applies not only to such exercises as mechanical copying, but to arithmetic, and, strange to say, even to composition. In the latter work, however, the best results were obtained by children who were able to work alone and undisturbed. All work requiring the aid of the imagination is done better in solitude than in company.

With regard to the influence of the time of day in which the work is done, Prof. Meumann makes some interesting discoveries. The hour from 5 to 6, he says, is the favourite one of most pupils for home work; then follow those from 6 to 7, 7 to 8, 1 to 2, 8 to 9, 9 to 10. Some of the best average work was done from 1 to 2 (after lunch), but special experi-

ments in time proved that the best work was done from 6 to 7, then from 5 to 6, and lastly from 1 to 2. The hour from 1 to 2, which appeared to have been very favourable for mechanical work, proved bad for composition, which was done better in the hours between 5 and 8. Work done between 7 and 8 was below the average in value, whereas all work done between 6 and 7 reached the highest standard, while that done between 8 and 9 sank to the lowest. Prof. Meumann was astonished to find that tasks carried out between 9 and 10 showed good results, in some cases above the average value. He gives as an explanation that not only are the children refreshed by supper, but that among them, as among grown-up persons, there are typical "night-workers." It is not known whether these children are especially inclined to nervousness.

In endeavouring to give a psychological explanation of the results, Prof. Meumann finds the mental disposition of the pupil is not the same at home as in class. This may be easily seen both by the quality and quantity of the work, as well as by the various kinds of mistakes occurring in it. The self-control of the pupil is better in class than at home, where the attention is not sufficiently concentrated, and the work often suffers from want of timely help. Added to this, the pupil shows greater indifference to his work at home; at school it is done more conscientiously.

But it is impossible, Prof. Meumann thinks, that these circumstances alone can suffice to account for the great difference in the work; there must be other hidden causes, and these he seeks in an elementary law of will. The will, he says, always adapts itself to the work demanded of a person, both as regards quality and quantity of that work, according to the speed at which a person works and to the intensity of the exertion. In an effort of will we are always dimly conscious of the outward circumstances of the work and of the importance of the object aimed at, while the entire inner disposition of the will changes automatically with outward circumstances and the work expected of us, without our becoming conscious of the fact. He demonstrates the truth of this law by many interesting examples of psychological experiments, and gives us the reason of a fact we are all acquainted with, viz., that the *less* time we have, the *more* we do. This elementary law of will also explains the results of holiday work, which were found to be less favourable than term work.

Thus the strange fact is explained that, on being urged to work *quickly* by the parents, the *quality* of the work also increases in value, for the desire to work quickly produces a greater exertion of the will, which reacts on the quality of the work. In class and under supervision of a teacher the effort of will is greater than at home, and as long as the result of the work depends primarily on this effort class work will be better in quality than home work.

On questioning the children as to their preference for home or class work, Prof. Meumann was struck with the answers and the way they were given, showing, as they did, that normal and healthy children fight shy of isolated work and like class work. This is in accordance with the gregarious habits of children: they desire encouragement from their comrades and they need it. These observations were found to hold good also in measuring the physical strength of children by the dynamometer. In company of other children they displayed greater strength than in isolated exercises. It is found, therefore, that "the will of a child rises to its normally highest level when the individual works in company with fellow-pupils striving for the same object, and not in isolation." If these observations are correct, it is not from any didactic motive that home work is to be considered as of little value, but because it is not in accordance with child nature.

As regards the disturbances occurring in the home, it has been found, both by experience and experiment, that, in as far as they occur with a certain regularity and are not actual distractions, they not unfrequently tend to increase the quality of the work, by stimulating to greater concentration. Modern man has learnt to do brain-work amid the bustle and roar of cities, in factories, and even in railway trains, and children accustom themselves with astonishing rapidity to perform their tasks in bad air and poor light, in a cramped position, and in some remote corner of the home. It is well they should learn to adapt themselves to circumstances, but the question is, how does the child suffer indirectly from such conditions? In many cases the effort to overcome difficulties may entail serious

mental fatigue; the strain on the eyes and other parts of the body may be such as to lay the foundation for future disease.

Regarding the question from a pedagogical point of view, Prof. Meumann comes to the conclusion that, although class work by no means represents the ideal of education, it has proved to be the best means of instruction under our present social conditions, and is by necessity adopted by the great majority of people. To have proved and confirmed this is the great merit of the experiments.

School work must be preferred to home work, but there are exceptions. Home work ceases to be unimportant, as the work of the child takes a more individual and independent character, bearing the mark of personality, and the more the higher mental qualities, as imagination and judgment, are taxed. Composition (essays), geometrical problems, drawing, and modelling may be done at home, whereas all mechanical work and written arithmetic should be done in school hours. The value of home work increases with the age of the pupil. Prof. Meumann puts the age at which it can be considered as a valuable complement to school work at twelve or thirteen. The Zürich schools have for years shown excellent results without the aid of home work for pupils under the age of thirteen. At this age, however, it acquires not only a didactic, but also a moral value, developing and confirming the habit of self-dependence. But even here it can only be considered as of real importance when the child is actually ripe enough to understand the moral motive of his work. When home work is given this should be done at rare intervals; as soon as it becomes a habit, the child's interest in it is apt to decrease. Great importance should be attached to the time of day in which the work is done, the hours from 8 to 10 p.m. being strictly avoided.

Although the idea of the great importance of home work has disappeared, there is still much diversity of opinion concerning its value among practical pedagogues. Many teachers utterly discard it, while others consider it very necessary as a means of strengthening and grounding the knowledge acquired in class. In both cases there is an entire want of scientific, more especially psychological, reasons for these opinions. What weighs most in the balance against home work is, according to Prof. Meumann, not the disturbances in the home, nor the hindrances of the surroundings, so easily conquered by the splendid elasticity of childhood, but rather the entire intellectual, moral, and mental conditions of the child left to its own resources and deprived of the society of fellow-workers.

COLONIAL AND FOREIGN NOTES.

UNITED STATES.

A few months ago we had a note on the question whether teachers

Notable Liberty.

should be paid when absent from their duties. Some discussion on the subject having arisen in Chicago, the Board of Education there has made the following addition to its by-laws:—"That on the death of a teacher a delegation of three teachers of the same school, including the principal, may be permitted to attend the funeral during school hours, without loss of salary." This will probably form a sort of *lo us classiques* on the subject of the liberality of school authorities towards teachers.

But the Chicago Board of Education has also weightier matters to

Child Wives.

determine. Superintendent Boline lately reported to it the presence in its district of a number of married women who were still within the purview of the compulsory education law of Illinois. In one Italian tenement house more than a score of wives under the age of fourteen had been found. The Board does not consider that child wives should be put in the same classes as unmarried school-girls. Accordingly a special school, or at least special rooms, will probably be arranged for them.

The Secretary of Columbia University has made an important announcement in regard to the educational policy of that institution. Candidates for the degree of Bachelor of Science will not hereafter be required to offer any ancient language at entrance or to pursue the study of any ancient language while in college.

Dr. David Murray, an American educator of note, who must be well known in England if only through his "Japan" in the "Story of the Nations" series, died at the town of New Brunswick, New Jersey, on March 6, after a long illness. He was born in Bovina, Delaware County, New York, in

1830, his parents being natives of Scotland. Graduating at Union College, in the class of 1852, he immediately entered the teaching profession, and was Principal of the Albany Academy from 1857 to 1862. In that year he became Professor of Mathematics and Astronomy in Rutgers College, where he remained until 1873. In 1872 the Japanese special embassy which visited Europe and the United States invited Dr. Murray to become Adviser to the Imperial Minister of Education, and he occupied that delicate and responsible post for six years, framing more than any other one person the modern educational system of the empire. He visited the Centennial Exhibition at Philadelphia in order to collect materials for the educational museum of Japan, and upon his permanent return to the United States in 1879 the Mikado decorated him with the Order of the Rising Sun. For ten years after he left the Far East he was Secretary to the Board of Regents of the University of the State of New York. Ill-health then compelled him to resign, but in 1897 he was able to lecture at Johns Hopkins University upon the history of education in Japan. Dr. Murray was a trustee of Union College, of Rutgers College, and of the Albany Academy, and had received the degree of Doctor of Laws from both the colleges which he served as trustee.

FRANCE.

M. Förfer, Inspecteur d'Académie, deplors the great irregularity in attending school that is observable throughout certain parts of the department of Aisne, the children being occupied for part of the year in field work. He has a suggestion to make. Why, he asks, should not agricultural labour be subjected to the same rules as work in manufactories? There is an age limit below which a child may not be employed in a factory. The same principle might be applied to employment of all sorts. If physical hygiene requires that infants should be kept out of the workshop, moral and intellectual hygiene demands that they should be drawn into the school even from healthy occupations pursued in the fresh air. Compulsory education is as necessary in the country as in towns, and is more easily enforced there than in crowded urban communities.

It is, however, the hygiene of the body on which French school-men are disposed at present to lay most stress. And, indeed, the subject is one to which France may well give consideration. If the laws of sanitation

are not scrupulously observed in some English schools, they are still less respected in French. Now, under the impulse of various Commissions, the responsible authority is being admonished to put the scholastic house in order. The *écoles maternelles*, in particular, have had a circular to themselves, enjoining a remedy of *installations défectueuses*. Moreover, a "League of Doctors and Families" has been formed to promote scholastic hygiene. It will hold its second Congress at Paris during the Whitsuntide holidays this year. The programme of topics for discussion at the meeting will serve to show the matters that engage the attention of the society: (1) the medical inspection of primary schools; (2) the education of families in scholastic hygiene; (3) holidays; (4) tuberculosis and teachers; (5) the overloading of time-tables. In return for a subscription of 5 francs you may express your opinion on any of these subjects. All of them are interesting and proper to be discussed. We concede it, as we have already conceded, that something remains to be done in English, and more in French, schools. Yet we will not withhold our opinion that of all those who concern themselves with the business of the school the hygienists are least remarkable for sobriety of judgment. Perhaps, however, in France the solid common sense of the "Families" may temper the reforming zeal of the "doctors," and so bring about recommendations practicable, really useful, and not likely to be disturbed by the next Congress that meets.

GERMANY.

Is our science teaching in a satisfactory state? We know that half a dozen large schools point with pride to the honours that their pupils have won in science examinations. But we know also of schools in which the science teaching consists of two hours of chemistry given to special forms by an untrained man. Even where most is done, is enough done for all? The secondary school should aim at supplying a course of instruction not "complete in itself"—that is an absurdity—but having a certain symmetry and adaptation to the general business of life or living. No obligation rests on it, we, at least, need hardly say, to produce chemists or opticians; but part of its task is to induce the scientific habit of thought and to cultivate the powers of observation. Some sort of true science teaching it should provide for all comers, as well as special training for those of special aptitudes. We doubt whether we could say of our secondary schools in general that they satisfactorily discharge their duty in this respect.

But, whatever we may think, hostile critics of the English secondary school are for ever railing at the inefficiency of its science teaching. And those who treat of the matter use the constant formula, "Look at

Germany!" We decided to take the advice. We set ourselves to ascertain exactly what is being done in Germany with regard to science teaching. Choosing a town of moderate size, mainly, but not wholly, industrial—Mainz-on-the-Rhine—we inquired what of science was taught there in the various secondary establishments. Thanking our correspondent for the information that he supplies, we hand it on to our readers.

Let us give first the scheme for the *Gymnasium*, or classical school. Science teaching, we are told, is understood as comprising instruction in "natural history" and in physics. In the lower classes, VI. to IV., the object pursued is not the systematic inculcation of formal knowledge, but the training of the faculties of observation (*Ausbildung der Anschauung*). Genus or species is studied through a few principal representatives. The ground is laid for a loving and intelligent converse with Nature. When Class III. is reached, the boys take up the outlines of zoology, in connexion with the anatomy and physiology of man; also, the outlines of botany: whilst what they have learned in the lower classes is revised and systematized. In the second half-year of Upper III. and in Lower II. a preparatory course of physics occupies attention. It comprehends elementary mechanics, the most important parts of heat, magnetism, and electricity, the chief chemical phenomena, a discussion of the most remarkable minerals and the simplest crystals, and easy chapters of acoustics and optics. In Upper II. the subjects of study are heat, magnetism, and electricity; whilst the ideas of chemistry and mineralogy previously gained are now widened and deepened. In Class I. mechanics, acoustics, and optics are treated with more thoroughness than before. With these two highest classes, Upper II. and I., the aim is not only to systematize and extend knowledge already gained, but also and still more to awake interest in groups of phenomena and to promote the examination of them in a way likely to make the student familiar with scientific methods and inductive reasoning.

Our readers will observe that, whereas in some English public schools chemistry forms the sole matter of instruction, at Mainz in the classical school it plays a subordinate part. They may have found "natural history" a stumbling-block. What Germans understand by *Naturgeschichte* will become plain from the scheme that we next reproduce. It is that for the *Oberrealschule*, or higher modern school, which, being Latinless, can devote more time to "modern" subjects. In such a school, as it is remarked, instruction in natural science must convey to the pupil a certain amount of positive knowledge, awaken and keep alive in him a delight in Nature, and teach him to observe and to turn his observations intellectually to account. The teaching falls under three headings.

(a) Natural History.—The object is to instil a knowledge of the principal forms of plant and animal life, and especially of the flora and fauna of Germany; to make the learner acquainted with characteristics and with the systems of classification based thereon; to inform him as to the main organs in plants, men, and other animals, and as to the functions of these organs; and to give him a general view of the more important kinds of minerals and rocks. In all teaching the starting-point is observation (*Anschauung*). The matter of instruction is distributed over the various classes as follows: In Class VI. the boys exercise their powers of observation and discrimination upon a few typical representatives of the plant and animal world. Reaching Class V., they add other representatives and classify old and new into groups. Classes IV. and III. study the plant and animal world in synopsis; also, the more important parts of anatomy and physiology. In Classes II.B and II.A mineralogy is taken up in connexion with chemistry, the chief rocks and their stratification being carefully examined. "Natural History" falls out in Class I.

(b) Physics.—The object is to make the pupil familiar with the most important physical phenomena and the laws thereof, with particular regard to practical applications. Instruction begins in III.A. During the year spent in that class and during the following year—that in II.B—the teaching rests entirely on observation. Physical phenomena are observed in the processes of Nature, or shown by experiment; the laws are inferred from the phenomena: then attention is directed to the causes, to *forces*. In II.A deduction is added to induction; but experiment is not deposed from its place. A text-book is now introduced. The distribution of matter is as follows: In Class III.A the general properties of solids are considered. A little mechanics (enough to make later instruction intelligible) is treated experimentally; and a little heat studied, also through experiments. II.B goes through a preparatory course in magnetism, electricity, acoustics, and optics. The work of II.A is heat, magnetism, and electricity (as we have said, now with text-book). I.B reads mechanics (including the theory of heat and the principles of undulation) and acoustics; I.A studies optics and does revision exercises from the whole course of science teaching.

(c) Chemistry.—The object of the teaching is to communicate an elementary understanding of chemical processes. Preliminary instruction is given in II.B. The metalloids occupy II.A. In I.B the metals are the matter of study; in I.A the more important chapters of organic

chemistry. Both the classes last mentioned have laboratory work, if only out of school hours.

What is done in Mainz is done in all Hessian towns possessing these two higher schools—*Gymnasium* and *Oberrealschule*.

Time.

Leaving our readers to make the comparison with English science-teaching for themselves, we turn to anticipate a question that will suggest itself at once and show, in tabular form, the *time* (number of hours per week for a school year) that is allowed for these extensive studies, confining ourselves to the *Oberrealschule*, as more instructive.

	VI.	V.	IV.	III.B.	III.A.	II.B.	II.A.
"Natural History".....	2	2	2	2	2	—	—
Chemistry and Mineralogy	—	—	—	—	—	3	3
Physics.....	—	—	—	—	—	2	2

I.A. and I.B. alike have three hours a week for physics, and three hours for chemistry, with two extra hours (not compulsory) for laboratory work. It is noteworthy that chemistry here forms, as it were, the crown of the edifice of instruction.

The design of this note is not to furnish a model for imitation, but to suggest to English schools matter for consideration.

A part of Education not to be neglected. Are they doing justice to the powers of observation? We are not minded to disparage the literary element in education. Much nonsense has been talked about "putting the book out of office." The nations that dispense with books in their schools are those which dispense with education altogether, and, indeed, with clothes on their backs. Yet the fact remains: that things are the primary, books only a secondary, source of inspiration for the mind. Lowell says:

"This learning won by loving looks I hived
As sweeter lore than all from books derived."

That was the education of a poet; but it is proper for the ordinary man, too, that he should be trained to observe and, in some sort, educated by observing. Properly understood, *observation is the key to book-lore*. Scientific and literary education are not hostile, but complementary, to each other. As for the science teaching that seeks to dismiss its recipients from the school with a bread-winning attainment of scientific knowledge, we confess that we like it not. Those who read our note carefully will see that the Germans will hear nought of it either—that their science teaching is broad, general, and educative, not concentrated upon some single, financially remunerative study. Let this be clearly understood. If our schools abandon the attempt to educate, and send for typewriting machines, they are acting not in the spirit of our great commercial rivals, but *directly in opposition to it*.

NOVA SCOTIA.

The report of the Superintendent of Education just received deals with the year that ended July 31, 1904. It tells of things to be regretted as well as of things to be rejoiced at. The colony is divided into 1,817 school sections, of which 240 were without a school in 1904, as against 179 in 1903, so that there was a loss of 61 schools. We are told the reason of the decline. It was mainly due to the feeling among teachers that rural School Boards were not dealing fairly with them; for, while the wages of even unskilled labourers and the cost of living had been advancing for many years, there had been no corresponding advance in teachers' salaries. Hence some of the older teachers were found to be giving up their schools for more remunerative employments, and others—these often the most highly trained—to be seeking appointments in the North-West Territory of the Dominion. In Nova Scotia the average payment to men teachers ranges from 196 dollars for those in the lowest class to 897 dollars for those in the highest; women in the lowest class receive, on an average, 177 dollars, those in the highest 533 dollars. The natural consequence of low salaries follows. Men look for educational work elsewhere, or for other work; and the schools fall chiefly into the hands of women. There were, during the year in question, 2,053 women teachers to 388 men.

We look next at a brighter feature. The number of school gardens set forth in the returns increased from 52 to 79. Especially at Middleton, in connexion with the consolidated school, and in some of the school sections about Truro, model school gardens have been organized under the stimulus of Sir William Macdonald. Believing in the garden as an instrument of education, we call attention to the account, given by the Principal of the school, of what is being done at Middleton:—"The garden in connexion with the Macdonald Consolidated School of Middleton has an area of one and one-eighth acres. This area is sufficient for this school with its enrolment of approximately four hundred. About one half of the whole space is divided into gardens for individual pupils, size 4 feet by 12 feet, with convenient walks between. The pupils from Grade IV. to Grade X., inclusive, are allowed some latitude as to their choice of what they shall plant in the gardens. As a result of this, nearly everything useful is grown. The pupils are required to prepare, plant, and care for their own gardens throughout the season. At

the end of the season they are expected to give a report of the work done. The report is prepared from notes taken during the season's operations. The pupils are allowed to dispose of their crops by permission of the Principal. The portion not devoted to individual plots is used for growing plants on a large scale—principally experimentally, with a view of ascertaining the relative value of farm crops, the possibility of increasing the yield under different conditions, also the effects of clover and other crops in respect to its mechanical condition and increased fertility. During the summer of 1904, cabbages, tomatoes, squashes, corn, potatoes, and clover were experimented with. The results in each case were satisfactory, exceeding expectations. In addition to the foregoing, a border 2 feet wide, extending along one side of the garden for eighteen rods, was devoted to growing flowers of various kinds. This was largely in charge of teachers with their primary grades. The garden is used very largely for Nature-study work, beginning in March with a hot bed. Plants especially are studied from germination to fruiting. The school garden work, as it bears not only on botany, but arithmetic, language, &c., is made both educational and vocational, and is one of the educative manual training departments of the school."

Leaving the gardens, we observe with satisfaction that the formation

Drill.

of military cadet corps is increasing among the more progressive Superior Schools. Even where there is no corps, physical exercise and military drill are not neglected. The regulations lay down that physical exercise should be given for a few minutes in the middle of every session over one hour in length. Moreover, teachers are required to make themselves acquainted with the system of military drill, at least as far as "squad drill." As so many of the schools are taught by women, women must also give instruction in drill. "This," the Report quaintly observes, "has no tendency to promote objectionable 'militarism.'" No; we could conceive it as having a very different effect. We should advise our colonists to pay better salaries and so keep men to control the warlike exercises of their youth.

Apart from the lack of men teachers the general situation is hopeful.

General Progress.

New school buildings of improved design and equipment are being opened in every quarter of the province, manual training is being developed, and school libraries increase in number. Above all, interest in education is being diffused, and "the young are being inspired with the higher ideas necessary to make them good and useful citizens of the province and our world-wide commonwealth."

NEWNHAM COLLEGE.

AN appeal for the endowment of one or more research fellowships at Newnham College has been issued by the officers of the Council of the College. The present time has been chosen by reason of an offer which has been received from a donor who is willing to contribute £100 to every £400 collected. For the last few years the College has maintained three research fellowships by means of annual donations, but the necessity of some permanent endowment is obvious. Hitherto the work of the College has been chiefly educational, partly because this was the first and most urgent need, and also because its income depends entirely upon the fees of the students. It has not, like the old foundations, any considerable endowments other than its buildings and the grounds in which they stand. On these, indeed, a debt remains to be paid off, though, owing to careful management, this is not large. Little help can therefore be derived from the existing College funds, which are as it is heavily taxed to provide scholarships for young students, too poor to afford a college education without aid. The existing fellowships have led to the production of books in classical archaeology (Miss J. E. Harrison's "Prolegomena to the Study of Greek Religion"); in historical philology (Miss Paues's "Fourteenth Century Biblical Version"); in medieval law (Miss Bateson's "Borough Customs"); as also papers in geology and in botanical physiology. This seems a very adequate record, having regard to the short time these fellowships have existed. The presence in College of advanced students stimulates intellectual activity among the younger members, and the existence of the fellowships has already provided opportunities for some women whose gifts might have found scope only under difficulties, if indeed, at all.

The prosecution of learned and scientific inquiry has always needed, and probably always will need, the support of the wealthy and the liberal. This scheme for the encouragement of learning may well commend itself to public benefactors interested in any form of intellectual progress, and especially to those interested in promoting the higher education of women. To endow a single fellowship, or to contribute to the existing fund, would be to follow an example set in the past by women who founded fellowships to aid the cause of good learning among men. Subscriptions may be sent to Mrs. Sidgwick, Principal of Newnham College, who is willing to give further information. About £3,000 would endow one fellowship of £100 a year.

CORRESPONDENCE

THE ETYMOLOGY OF "EDUCATION."

To the Editor of The Journal of Education.

DEAR MR. EDITOR,—It seems to be nearly as difficult and dangerous for one's peace of mind, even for Truth's sake, to deflect from current orthodoxy in Etymology as in Religion or Politics; does it not? So we have both found it since the earlier years, when you and I tried to help to pioneer educational thought, in the days of such stalwart protagonists as Prof. Payne, Prof. Meiklejohn, Prof. Hodgson, Dr. Quick, Oscar Browning, and many others you well wot of; when I used to associate with them in their quickening influence on these by-gone years. But I am sure, both you and I rejoice greatly that these educational themes have interested one of the *Dii Majores*, Prof. Skeat; even although his letter exhibits more of "Human Nature" than is generally associated with calm Philology and cool Philology.

I confess it; I was long as orthodox, and as proud of the *Textus Receptus*, as Prof. Skeat or any other. I saw in it then singular insight into metaphysical problems; and used to dilate,—yes, before the College of Preceptors,—as so many have done, on its reputed wisdom. Since these days, now more than a quarter of a century ago, I was one of the revisers and workers on the first edition of "Chambers's Etymological Dictionary," along with my good friend, Dr. Scott Keltie, who happily still survives, and a dozen more, mostly gone from us. It was edited by my early friend, James Donald, who perished prematurely in the terrible Morpeth accident, on his way to London. For years, it was known by his name. In the Preface, Mr. Donald acknowledges obligations to Mr. Weir of Edinburgh Academy and to your servant. The work was based, for teaching purposes, on the educational principle, therein stated, of "Self-Suggestion" of meaning through derivation—an idea which was carried out, with more or less success, throughout the work. It has passed through many editions, and recently was issued as "The Twentieth Century Dictionary" under the scholarly editorship of the Rev. Thomas Davidson.

Since then, however, I have been compelled to abandon early prepossessions in this Philological field, as well as in many other departments of inquiry. This was accelerated by a letter in the *Educational News* of October 22, 1898, under the pen initials, "W. B.," whose personality it is difficult to discover, but whose utterances are as piquant and nearly as wise as those of another W. B., William Barnes, of immortal memory, the learned author of "TIW," with its curious view of "the Roots and Stems of English."

There, in that letter, the modern "W. B." declares himself thus:—"There is scarcely any writer that has treated on Education but has, at some period, trotted out the Etymology, 'Education from *educere*, to lead out.' Yet," he says, he has "no hesitation in saying that it is decidedly wrong."

That's plain speech, like all his utterances. "From *educere*, you form *education*, not *education*, which is from quite a different word, *educāre*. This latter word meant," he continues, "originally to nourish, to foster; an idea which cannot easily be connected with 'leading out.'" It was he that suggested its derivation from *edere*, to eat, like *manducare*, from *mandere*, to chew, as mentioned in the article under criticism. He further concedes that its meaning was no doubt influenced by its resemblance to *educere*. He gives examples of such influence, in the words: "Villain," which, though derived from *villa*, takes its meaning from *vile*, which, in French, has even changed its spelling; *ingenuity*, which is derived from *ingenious*, but takes its meaning from *ingenuity*—rightly observing that it is a mistake to translate, as is often done, the French *ingénuité* by the English "ingenuity."

Indeed, as for that, he might have adduced the great work of the Rev. A. Smythe Palmer, late Scholar of Trinity College, Dublin, which gives more than six hundred pages of such *Verbal corruptions of words*—"perverted in form or meaning by false derivation or mistaken analogy." "W. B." finally sums up: "Wrong ideas lead to wrong actions, and I have no doubt that many blunders in the theory and practice of Education are to be traced to this erroneous Etymology." Tell me anything truer, good reader, if you can.

This daring utterance whetted old interests, and set me on re-renewed investigation; with results as given in my unfortunate

article in your issue for March. As you are aware, however, it was not printed in full, but only as the partial kernel, according to your own desire, from the exigencies of space. Hence the misunderstanding regarding its purpose and details by Prof. Skeat. He has taken the comparison of two special Latin verbs for the declaration of a general principle; and hence his condemnation of it as "an amusing utterance." The rigidity mentioned was strictly confined to the classical forms of *quantity*, and "conjugation," which have practically been discarded in English. This all verse makers know to their cost, *accent* taking the place of *quantity*, even in *hexameters* and *pentameters*, in translation by the ablest scholars.

Placed in parallel view, the contention becomes more apparent, as thus:

- (i.) *ēdūco, ēdūcāvī, ēdūcātum, ēdūcāre*;
- (ii.) *ēdūco, ēdūxī, ēdūctum, ēdūcere*.

From these we have two words in English, &c.:

- (i.) *Education*—admittedly from (i.) *ēdūcāre*.
- (ii.) *Eduction*—admittedly from (ii.) *ēdūcere*.

At this point begins the controversy regarding (i.) *Education*. Is that word, in Latin, English, Romance languages, and all that have adopted it, derived from (ii.) *ēdūcere*?

That's the whole matter in a nutshell, up to this part of the problem proposed.

Then as to solutions:

- (i.) *Education*, though almost universally agreed to as derived from (ii.) *ēdūcere*, is not so regarded by all as truly so. Dr. Murray, among other dissentients, calls it a "quasi-philological" relation. The relation, undoubtedly, has long existed.

That's our case, barely stated.

But Philology alone cannot settle such questions, though its principles must not be violated. This final determination can only be reached, if ever, by inquiry into the genius, capacity, history, environments, aims, and achievements of the race that originated the term; as I endeavoured partially to explain.

It is well put by Dr. James Mackinnon, in his "Culture in Early Scotland": "Culture embraces the mental condition of man and its modes of expression. It refers to its intellectual and moral state, its sense of arts or its manual skill, its customs and social institutions, as far as these may be inferred or have been handed down by written record." He includes also, of course, any other available record or source of knowledge.

On this subject, as Kiddle and Schem also tell us, "*Education* is properly used to designate the sustenance and care bestowed by a nurse on a child"; but they inconsistently derive it from (ii.) *ēdūcere*, to lead out, though they confess that "it never has this literal sense"! They make further very pertinent and true observations; concluding by saying that the aim of all culture or education is that: "Education, in its proper sense, is the deliberate effort on the part of one conscious being to clear the way, so as to enable another to attain the perfect condition of life and its normal progress."

They admit that "Education is used in a variety of senses, not compatible with this true idea." Indeed, the problem is centralized in Varro's phrases—"*Educit obstetrix; educat nutritrix*"—as given in the March article.

In this connexion, a significant fact emerges in the historical examples given by Dr. Murray—viz., that the word *Education* was, in English literature, used in this true sense of feeding before the seventeenth century. One writer, in 1607, speaks of horses being well bred and educated on oats; another, in 1540, of beef making Englishmen stronge, the education of them being considered."

My own admiration of Prof. Skeat's services has been long so pronounced that, if I had a percentage on all the copies of his Dictionary I have induced Boards and teachers to purchase, I should have had something substantial to my credit!

Apart, however, from these personal matters, that have been thus introduced, not by myself, and which always, more or less, cloud intellectual vision, I should suggest that your band of scholars should devote themselves to this inquiry, and try to settle the matter on its own merits. Such questions as the following might receive attention:—

- (1) How does the orthodox Etymology evolve the idea of feeding and nourishing from that of leading out?
- (2) Is *edere*, as suggested by "W. B.," the true root or not? The obsolete form, *edica*, now and in Roman times represented in *esca* and in *esculent*, is in its favour.

(3) Hence my attempt to suggest another root, in the Aryan *√ dug*. If wrong, let us find another equally pregnant. This would rejoice all scholars and teachers, and delight myself.

My own heterodoxy was confirmed when, in 1879, I edited the Educational utterances of George Combe, as published by Macmillan, in a huge volume, embodying advanced views of the subject, which are still before the age, and in which the subject is fully treated philosophically and philologically.

It was further confirmed when, in 1890, I became convener of a Committee of the Glasgow Archaeological Society, appointed to conduct explorations of the Antonine Roman Wall between the Forth and the Clyde. The Report drawn up by us was published in 1899, and embodies most important papers by Mr. Haverfield, M.A., and others.

In conclusion, allow me, Mr. Editor, to say that, with your good help and that of your body-guard of scholars, we shall eventually become skilful *Sutors*, framing, as far as in us lies, a buskin worthy to be placed on the dainty foot of the Goddess of Truth—whose statue now stands before my eyes, with laurel crown and lighted lamp—and whose buskin has taken ages to frame and fit, and will take some time longer still to complete. She, greatest and simplest of Goddesses, has too much been made merely the Cinderella of the race. But it is in such cinders that the Divine fire will survive; and thus we shall help to make the wonderful “glass” slipper she only is entitled to wear! In such a delightful task, all of her true lovers and devoted worshippers will ever pledge themselves to be *Active*, without being *Agitated*, in her service; as many have been in the past, and may still be, in helping the happier future before Education and Progress.

WILLIAM JOLLY.

SPOKEN FRENCH.

To the Editor of *The Journal of Education*.

DEAR SIR,—Will you allow me to call your attention to the advertisement of Messrs. Jack on page 279 of this month's *Journal of Education*? I believe it is quite incorrect to say that “spoken French is to be compulsory in Junior Cambridge.” Candidates for the Junior Certificates are *allowed* for the first time to take spoken French on payment of an extra fee. The advertisement is very misleading, though, no doubt, unintentionally so.—Yours faithfully,

LILIAN TALBOT, B.A. Lond.

Channing House School, Highgate, N.

April 5, 1905.

AENEID II. 268–297.

’T WAS the first hour when slumber softly steals
O’er wretched men, the choicest boon of Heaven.
Lo! as I slept before me seemed to stand
Hector all woebegone and bathed in tears.
Marred was his form, begrimed with dust and gore,
And his feet swollen where the thongs had pierced
That bound and dragged him at the chariot wheels.
Ah, what a change was there! Could this be he,
The Hector radiant in Achilles’ arms,
Or on the Greek fleet hurling Phrygian fire?
This matted beard, these gore-bedabbled locks.
These wounds that witnessed many a bloody fight
Around Troy walls. Myself I wept and first,
Meseemed, addressed the hero through my tears:
“Light of the Dardans, Ilion’s hope and strength,
Long hast thou tarried: what far land has stayed,
Hector, thy coming? With what weary eyes,
Thy friends all dead, thy country in the dust,
At last we greet thee! What foul villany
Hath marred thy visage; whence these gaping wounds?”
Nought to my idle questions he replied,
But, with a deep-drawn groan, “Ah, fly!” he said,
“Fly, goddess-born, and snatch thee from these flames.
Our walls are razed, and, from its towered height
Troy topples down. Thou hast done what man can do
For Priam and thy fatherland. If worth
Availed to save, they had been saved by mine.
Troy now to thee commits her sanctities
And household gods, thy destined lot to share.
Seek out for these a dwelling; thou shalt raise
A city, having compassed many seas.”
He spoke, and from the inner shrine brought forth,
Symbols of Vesta’s high divinity,
Her fillets and her never-dying fire.

Notice must be given of all remittances through the Post Office from abroad, stating full name and address of the sender; and all Foreign Money Orders must be crossed for payment through a Bank.

LONDON: WILLIAM RICE, 3 BROADWAY, LUDGATE HILL, E.C.

HUMANISM AND REALISM AS FORCES IN HIGHER EDUCATION.

By F. W. WESTAWAY.

THOSE of our great philosophers who have attempted to analyze the English character have been singularly mild in their strictures, curiously considerate to our sensitive natures. The consequent self-satisfaction enables us to endure, without flinching and with easy contempt, the lashings of our latter-day minor prophets, who, after venturing to give expression to unpopular opinions, often find themselves vainly beating the air.

We delight in enumerating our many excellent national qualities—our energy, self-reliance, versatility, and integrity, our love of justice and sense of fair play, and our measured and moderate cast of mind—and we flatter ourselves that we still possess the unconquerable resolution of our forefathers. When, however, we read that we are a people "steeped in insularity and imbued with utilitarianism" we grow a little restive; at the assertion that we are "unscrupulous in our dealings with competing nations" we become indignant; and at the mere whisper of the suggestion that "an Englishman is a person of parochial intellect and utterly unable to think clearly or to reason" we rage furiously, conscious that the shaft has found its way home.

Our best friends do not dare to endow us with any great intellectual qualities. We are considered to be, and consider ourselves to be, a "practical" nation; but we seem to forget the limitations implied in this term—are almost unconscious that it is little more than a euphemism for "unintelligent." The practical man works on "common-sense" lines—that is, he does what is immediately obvious. In many ways he is an excellent fellow; his honesty of purpose cannot be questioned, and he works well; but he has little insight, he hates thinking, and all his opinions are ready made.

Some of our younger writers, especially those of the enthusiastic sort, have attempted to demonstrate that, as a nation, we are showing signs of decadence. But the evidence hitherto brought forward seems insufficient to prove either that there are

any serious signs of physical deterioration or that there is any great slackening of moral effort; in these respects we may be no better, but are probably no worse, than our grandfathers. On the intellectual side the evidence is more unfavourable. Elementary education in England has, no doubt, made great strides during the last thirty years; but education other than elementary is still unorganized, and, in some ways, is as imperfect as it is incomplete. There can be no doubt that this is a source of national weakness. Perhaps a nation's greatest potential asset is the brain power of its middle classes. In England this remains largely undeveloped, and, intellectually, we have made little advance during the last half-century. Meanwhile the other great nations have been rapidly forging ahead. Absolutely we stand, perhaps, where we did; but, if a nation's greatness is to be measured by the intelligence of the people, relatively we now take a fourth or a fifth place. A well known writer has remarked that nearly all that can be done simply by the insight that comes from practical capacity has already been done. Hitherto this practical capacity has been the chief factor in the success of modern nations; but, at last, the world is beginning to think.

We have in the English educational world two distinct types of mind; these are more than wanting in mutual sympathy—they are mutually hostile. The one is well represented by Huxley, the other by Matthew Arnold. These two eminent men, both of whom left the world much richer than they found it, won our regard by their efforts to spur us onwards "towards the growing light of a larger day." Yet how different were their methods, how different their ideals! Equally aggressive, they both hit straight from the shoulder—the one with bare knuckles, the other with gloved hand. Each a complete master of his mother tongue, the one spoke plainly, bluntly, almost brutally, and with a logic as implacable as that of Greek tragedy, the other with a perfect balance of phrase, with glowing words, and with forceful epigram. Huxley sought truth in reason, Arnold in beauty. Each saw only one side of the shield and stubbornly refused to look at the other.

"He who will not reason is a bigot, he who cannot is a fool, and he who dares not is a slave." That men will listen to reason is, however, the great irrationality of the academic logician. Principle often clashes with prejudice, and, sometimes unconsciously, we surrender our convictions to our wishes. As long as the hearts of men are thrilled by the deeds of the national heroes, as long as there are political "parties" and religious "factions," so long will the perplexing irrationality of the mind manifest itself. Few men have had absolute control over their feelings. Spinoza himself is said to have broken out into a fit of unreasoning passion when he heard of the assassination of his friends, the brothers De Witt. Observant foreigners have, however, been known to remark that the lack of power to think clearly and reason logically is a characteristic peculiarly English. Even if such an assertion be only partially true, it is one which suggests a defect in our educational methods, and therefore one which is worthy of serious consideration.

Undoubtedly, there are in the nation at present several elements of great instability, but it is as unfair as it is illogical to say that, as a people, we are showing a greater and greater tendency to be swayed by the impulse of the moment, and that we are reverting to the French period of *sensibilité*—that we are always "palpitating with excitement, steeped in melancholy, or dissolved in tears." If, indeed, we measure the equilibrium of the nation by the hardened "convictions" of many of its most enlightened citizens, our stability is little less than that of the pyramids. Why should we question our convictions or trouble to reason? Do not both Pope and Young urge us to distrust reason in favour of instinct? It is quite true, as we are reminded by Madame de Staël, that sometimes, in the strife of motives, instinct alone can decide us; but the Englishman's danger is that, from sheer indolence, from his intense hatred of consecutive thinking, he will, without the exercise of any intelligence, get into the habit of always blindly following mere animal impulse, "the instinct of the thoughtless brute."

If a statesman be defined as one whose deductions are drawn from permanent forces, whose vision is not obscured by the superficial struggles of the moment, who, in regard to his opponents, as Locke would say, examines impartially all evidence brought forward, and does not impute unworthy motives, then the contention of foreigners that statesmanship is a

comparatively rare quality amongst Englishmen seems to be true. No doubt partisanship is as common with other peoples as with us, but the extreme partisanship of unreasoning conviction seems to be a distinctive mark of many Englishmen. Usually the faults of men of this class are, if serious, mainly negative. In debate, for instance, they do not attempt to tear aside the veil from the specious and the plausible; they follow precedent and cleverly reflect other people's opinions. Perhaps they seldom realize in what shallow intellectual waters they are accustomed to swim. Their great object is to fascinate the multitude; yet they are honest enough, for they do not suspect, and therefore do not cross-examine, themselves. Minds that do not reflect and reason are necessarily imperfectly trained. Temperament and environment are, no doubt, factors always to be reckoned with, but, as a rule, a man is largely what his education makes him.

At a time when other nations are making such marked progress, it seems doubly unfortunate that in England the statesmanship of the few should so often have to yield to the unreasonable clamours of the unreasoning many. Public opinion in regard to higher education is seldom more than lukewarm, and is frequently openly hostile. Education Committees naturally have to consider the ratepayers, and it is the middle-class ratepayer who is wont to be so troublesome. Too often he is a man who understands little of self-sacrifice. Why should he "practise self-denial for the sake of posterity, economy for the sake of debtors yet unborn"? Posterity, he tries to argue, is no heritage of his.

As the great majority of the middle class are educated in our secondary schools, there would seem to be some deficiency in the education given in those schools. An education must needs be imperfect if the majority of the educated are found to be lacking in breadth of view and do not show any great desire to learn the truth of things.

It is scarcely necessary to speak of physical education. As a rule, there is little that is scientific in the teaching; but the present-day boy generally contrives to keep his lungs full of fresh air and to develop some of his muscles. Neither is there much need to discuss moral education. A public-school boy will probably find himself in the hands of an untrained teacher who knows little of the psychology of moral education, but who is almost certain to be a gentleman and a man of moral strength, and who bears in mind Goethe's maxim: "Character calls forth character." It is the intellectual side of the boy's education about which there is so much room for doubt.

The arguments adduced by the classical man or by the man of science in favour of his own subject as an instrument of education are far too often based on the assumption that the teacher will be highly trained, a perfect master of his subject, and working under ideal conditions. But, in practice, this seldom obtains. As a rule, both the young classical teacher and the young science teacher are untrained; they know little about the science of education and still less about the art of teaching. They regard their boys as so many of Carlyle's passive buckets, simply to be pumped into. They confuse the physiological processes of digestion and assimilation with the mechanical process of filling a cask. They do not understand mind development.

In one important respect, the classical teacher—and, indeed, the teachers of literary subjects generally—are at a serious disadvantage compared with their science colleagues. During a Latin or a history lesson a boy naturally has to accept all "facts" on the authority of his teacher or on the authority of text-books; and, if, during his school career, there is no counteracting force, the boy forms the habit, probably never afterwards eradicated, of blindly accepting, without question of any kind, other people's facts and opinions. It hardly occurs to him to question authority. This seems to be the clue to most of the deeply rooted prejudices of the average Englishman. He does not admit any prejudices—that is natural. He calls his opinions "convictions"; but it has probably never occurred to him to examine the evidence on which those convictions are based, and any suggestion that he should do so he considers to be almost profane.

Even if a boy goes up later to the University, the habit may still cling to him. A young German student is encouraged, and expected, freely to cross-examine even the oldest professor of his University; but this kind of thing finds little favour in England. Of course, the handful of students, classical and

other, who round off their University career with a "First," or perhaps a "Second," generally overcome such a habit; but this is often due more to their native genius than to their education. Probably, however, the classical man has always to exercise a greater effort than the man of science in order to effect complete self-elimination. The trained man of science is never seriously affected by the personal factor—unless he is fighting the humanists. The essence of our educational system—unquestioned acceptance of authority of every kind—is against the development of individuality. We are so fond of a standard pattern.

A comparatively small minority of boys ever reach the sixth form and go on to the University. The majority leave school at the age of sixteen or seventeen, and one of the most difficult of our unsolved educational problems is to decide upon a curriculum which will enable us to turn out at that age a presentable "finished product." It is here that the classicist usually fails to help us. His curriculum is designed to meet the wants of the few boys who survive to the sixth form. Up to the age of sixteen or seventeen the work of the average boy, not the brilliant boy but the average boy, is one long struggle with words, and words alone. The discipline is excellent, is perhaps the best the schoolmaster has yet devised, but it is a misuse of terms to speak of the work as humanistic. The boy leaves school all unconscious of "the best that has been thought and said in the world"; he has no literary appreciation, no love for literature, and his English composition reveals a woeful ignorance of his own tongue. It is this type of boy who is supposed to develop into the "intelligent man in the street"; yet it is more than probable that the only constant intellectual influence which he experiences after leaving school is derived from the newspaper. Hurried and unreflecting reading must always lead to intellectual mischief, but, following an education so imperfect, it can result only in chronic confusion of thought. As a permanent educational force journalism has great responsibilities. The journalist has no longer to write for a nation of philosophers, as Montesquieu called our forefathers, but for a feverish public clamouring for something that will titillate its palate; ungarished facts it does not want and will not have. Here is the journalist's danger. A column of "impressions" may be full of realism, may even be tinged with cynicism; but a writer who is partial ceases to be truly educative.

It has been said that to draw inferences is the greatest business of life, for we have constant need of ascertaining facts not directly observed. Many logicians of the older school seem to have laid far too much stress on syllogizing and too little on induction. Until recent years few of our secondary schools appear to have provided for the serious teaching of inductive reasoning: most of them were content with syllogistic reasoning alone. Not that they attempted the formal study of the syllogism *qua* syllogism—logic as a science has long gone out of fashion—but such reasoning as was taught was, primarily at least, deductive. For this purpose mathematics naturally stood first; then Latin: for, in essence, the kind of reasoning to which a boy is compelled when he is disentangling the threads of a difficult sentence from Cicero or Livy is not widely different from mathematical reasoning. It is essentially deductive in both cases. But, as Condillac pointed out, the kind of reasoning in which we are all engaged in everyday life is largely inductive. "Thought sets out from particulars." A common fault is to attempt to use the rules of deduction for purposes of generalization. The would-be moral reformer is especially prone to this; a few isolated instances of indiscretion on the part of some section of society are often sufficient to make him hurl his anathemas broadcast; he is not content with simply recording facts actually observed: he will take the fatal step of generalizing from a small number of instances. A little reflection will show that we are often inclined to make hasty generalizations in everyday affairs. Few things, perhaps, are more common. Both Hume and Mill were keenly alive to the difficulties and dangers of inductive reasoning, and the latter gave much attention to its consideration. With many Englishmen there is the further danger that, having once made a generalization, having once formed an "opinion," they are likely to refuse the claims of any new evidence; and this irrespective of the fact that the opinion may or may not have been justified by the evidence originally available. The Englishman thinks that to change his opinion is a sign of weakness.

It would appear that at least some of the defects in the character of the English middle class—the narrow outlook upon life, the want of any real humanism, the acceptance of all authority unquestioned, the mental indolence, the tendency to hasty generalization, the general inability to reason, and the studious avoidance of unpalatable facts—are mainly the results of an imperfect education. "Our secondary schools have grown up with the nation; so that they reflect both the national merits and defects." The interesting question arises: Can these defects be remedied?

It has been said that the quarrel between the humanist and the realist is "the old quarrel between the contemplative and the active life." Strange as it may seem, the most violent partisans on both sides are precisely those who know practically nothing about the real subject of the dispute—education. The extreme classicist and the extreme man of science both claim the prophet's mantle. Each considers himself to be the happy possessor of a quintessence of educational science, distilled in the one case from Latin hexameters, and in the other from dielectric strains. So humanist and realist continue to lunge at each other in the educational arena. The observing public, awe-struck by the fury of the combatants, shows hesitation, and, Paracelsus-like, oscillates between the old and the new.

(To be continued.)

REVIEWS AND MINOR NOTICES.

A History of Criticism and Literary Taste in Europe, from the Earliest Texts to the Present Day. By GEORGE SAINTSBURY, M.A. Oxon., Hon. LL.D. Aberd., Professor of Rhetoric and English Literature in the University of Edinburgh. In three vols. Vol. III.: *Modern Criticism*. (Price 20s. net. Blackwood.)

We cordially congratulate Prof. Saintsbury on the triumphant conclusion of his monumental work—"the actual work and companion of seven years in its composition, the result of more than seven and twenty in direct and indirect preparation." In spite of a defiantly inartistic style where stylistic mastery would naturally be expected, in spite of belligerent divergence from reputable critical opinion, and in spite of "ignorances and forgetfulnesses" (comparatively most venial, however), he emerges from the long conflict brilliantly victorious by reason of original research, independent judgment, masterly control of materials, and irrepressible *vis viva* and gaiety of spirit. He has penetrated the jungle and blazed paths in every direction—paths more or less rough, but still clear and unmistakable. Not only has he surveyed the ground with his own eyes, but he has also created and stimulated fresh and piquant interest in the multifarious problems—a far more valuable achievement than any number of correct solutions. His work is vital and seminal. In any general estimate the large lines of the scheme ought not to be blurred by petty criticisms, which properly belong to the specialists in details and in no way affect the main scope of the investigation. The next *History of Criticism* may be—and ought to be—a better book than this; but the author's indebtedness to this will not be measured in limited terms. Meantime, and for our time, Prof. Saintsbury holds the field.

The present volume covers the nineteenth century, and includes "those dissidents or pioneers" of an earlier time "who then laid the foundation of the chief critical performances of the nineteenth century itself." Indeed, "the Dissolvents of Neoclassicism" occupy nearly a third of the pages. The German phase was not so very hardened, and gave way early under the national craving for knowledge and romantic and philosophical turn of mind. Bodmer and Breitinger, "more than any other pair or person," mark the turn of tide; J. E. Schlegel, "that Marcellus of German criticism," was the first German who felt the true inspiration and healing power" of Shakespeare; and "enfin Lessing vint." The treatment of Lessing is comparatively full and carefully discriminating: "we have not feared to speak of Lessing's shortcomings, but, though it is possible to speak indiscreetly and unadvisedly of his merits in kind and point, who shall overpraise them in degree?" In France, neoclassicism was established in great force, in the strong places of literature as well as in the French literary temper. The

three greatest dissolvers were Diderot, Chateaubriand, and Joubert. "Diderot is, in principle and motive force, however eccentrically working, if not in actual expressed example, the most considerable of the three, and perhaps the most considerable single figure" of the dissolvent period. "The greatest glory of Chateaubriand is that he is, if not the creator, the first brilliant exponent, of the Critical Imagination—the first great practitioner of imaginative criticism since Longinus himself." Madame de Staël, Villemain, and Beyle are perhaps the most notable of the other French subjects of Prof. Saintsbury's analysis. In England the critical personalities were not of first literary rank (except Gray, perhaps). But in "the rediscovery and revaluation of the capital of the literature for critical purposes, England takes the most important position of all," mainly by reason of the richness of the material. The chapter on *Æsthetics*, if only on account of Prof. Saintsbury's fundamental principles, offers large room for controversy, but is very instructive and able. The influence of "the widened and catholicized study of literature during the earlier eighteenth century" is an extremely interesting element, and might have been profitably exemplified at greater length.

The attitude and the method of Prof. Saintsbury might well exempt us from following him through the reconstruction and the further progress of critical effort. On Wordsworth we are rather inclined to agree with Prof. Raleigh in the main. As to Coleridge, "his critical work, with all his everlasting faults of incompleteness, digression, cumbrousness of style, and what not, gives him a position inferior to no critic, ancient or modern, English or foreign." Lamb requires, and receives, delicate and firm discrimination; and other critics of the age—notably Hazlitt, Jeffrey, and Hallam—are judiciously estimated. While genuinely "appreciating," this emancipated group nevertheless had their shortcomings, "which were neither few nor inconsiderable; and which led directly to the sad and singular decadence of English criticism in the middle third of the century." In particular, their narrow knowledge, their lack of comparative knowledge of different literatures, drove them "to judge by the inner light alone." Yet, after, there "remains to their credit such a sum as hardly any other group in any country—as none in ours certainly—can claim." Most important in the weak middle third of the century are the searching notices of Macaulay and Carlyle, while Thackeray is generously treated, and George Brimley is a touchstone that justifies the appreciative critic. In the later period, Matthew Arnold is very distinctively to the fore—"one of our chiefs of the greater clans of criticism," whose "services to English criticism, whether as a 'preceptist' or as an actual craftsman, cannot possibly be overestimated." Though Prof. Saintsbury is "not, by any means, in general agreement," but "often in very particular disagreement, with Mr. Arnold's critical canons, and (less often) with his individual judgments," yet, looking back over European criticism for the eighty years since Arnold's birth, he "cannot find one critic, born since that time, who can be ranked above or even with him in general critical quality and accomplishment." No less than twenty-two pages are devoted to Arnold's work. Pater is more to Prof. Saintsbury's critical mind: "to assert too positively that he was the most important English critic of the last generation of the nineteenth century—that he stands to that generation in a relation resembling those of Coleridge to the first, and Arnold to the latter part of the second—would, no doubt, cause grumbles"; so he concedes that Pater "is somewhat less than either of his forerunners." The survey of French and German criticism is equally thorough (on main points) and equally luminous, and its value is immensely enhanced by comparison with the English sections. The better French criticism, though astonishingly varied and evenly excellent, "is not always, even in its highest examples, of the *very* highest." So with the Germans: in spite of all the virtues of Lessing, Goethe, and the Schlegels, yet "in the highest and purest work of criticism, as we here define it, even these their greatest are sometimes strangely wanting; and others are wanting less strangely but more disastrously." Their "scientific" quality is suicidal, and it coincides suggestively with the absence of production of great poetry or of great literature." The appendices on "The Oxford Chair of Poetry" and "American Criticism" are very important and interesting. Regarding the whole work from the standpoint of the author's intentions, one cannot but pronounce it in every respect great.

The Poems of John Keats. Edited, with an Introduction and Notes, by E. DE SÉLINCOURT. (Methuen.)

We have, for the first time, a wholly satisfactory edition of the most memorable, though by no means the greatest, poet of the eighteenth century. Mr. de Sélincourt is a ripe English scholar and he has for years devoted his leisure hours to the study and elucidation of his favourite poet. Not only has he cleared up many obscurities that have baffled previous editors, but he has set in a new and truer light the relation of Keats both to his contemporaries, Hunt, Shelley, and Wordsworth, and to Greek mythology and literature. The tradition that Keats derived all his Greek lore from Lemprière, that this was the Bible he studied night and day, the text from which "Endymion" and "Hyperion" were evolved, is finally exploded. It was from Chapman, and still more from Sandys, that the inspiration came, and it is well to mark in passing what life may still be left in a translation at second hand. It is a new chapter and a most interesting one that the editor has opened up in tracing Keats's indebtedness to Ovid. Occasionally, we confess this search for *origines* seems to us to border on pedantry. Thus, on the line from "Hyperion," "prophesyings of the midnight lamp," we have first the familiar lines from Georgic I. quoted after W. T. Arnold; then these are rejected, not on the score that there is little real similarity—Vergil's thief in the wick is merely the old woman's weather-glass—but because Keats, though he had read Vergil at school, was not scholar enough to appreciate the language, and we are left with the unsatisfactory conclusion that the line is not borrowed from Vergil, but from a Vergilian echo in some scholarly Elizabethan not yet identified. Surely this is "*chercher midi à quatorze heures*." There is no need to search for illustrious names in great Eliza's days to father a popular superstition, and the editor has apparently overlooked some occasional verses of Keats himself:—

Romeo! arise, take snuffers by the handle,
There's a large cauliflower in each candle,
A winding sheet.

But we are making too much of a small matter that merely shows an excess of zeal, the defect of the editor's qualities.

On the supreme question of Keats's order of merit, the niche to be assigned to him in the Temple of Fame, Mr. de Sélincourt shows sanity of judgment and a nice discrimination between the early work and the poems of maturity. Mr. Matthew Arnold, in his preface to the Ward "Selections," takes as his text for a discourse on Keats Milton's famous saying (which he characteristically misquotes) that poetry should be "simple, sensuous, passionate"; and, though the point of the essay is to show that Keats is something more than the sensuous man of genius, yet that unfortunate expression of Keats, "a life of sensations rather than of thoughts," is misinterpreted and assumes undue prominence. Mr. de Sélincourt does not ignore or conceal the feet of clay—once and again he calls attention to vulgarities both of thought and diction in the poems—but he shows us them in due proportion and directs our gaze to the perfect lineaments.

What Keats might have achieved had he lived the full span of life, had he even attained the age of Shelley or of Byron, is perhaps an idle speculation. We should have had other odes equal, but hardly superior, to those "To Autumn" and "To a Nightingale." "As an interpreter of Nature to the heart of man he was already, in his way, unapproachable." Whether he would have ever achieved a great epic or a great drama is to us more problematic. He had, indeed, objective power, the power that finds its way to all the instincts of worm or eagle (to borrow his own phrase); but neither of his longer poems shows even the rudiments of architectonic force, the faculty of conceiving a vast whole like the "Odyssey" or the "Commedia" and even "Faust." If asked what line in Keats's poetry best expressed the genius of Keats, most would answer:

A thing of beauty is a joy for ever;

but there is another less familiar line which seems to us equally characteristic:

To keep our souls in an eternal pant.

In conclusion, we may note a most useful glossary of archaic words, or words used in a peculiar sense, giving the probable source from which they were derived. It is most instructive as showing Keats's favourite authors. "Volcanian," "scintial," "sphere" might be added. We wish that the editor had given

us more annotation on Keats's rhythm and rimes. How would he scan the grand line :

Ther, Thea, Thea, where is Saturn?

Does

How many hards gild the lapses of time

really satisfy his ear? Cockney rimes, too, deserve a passing note. "Thought—port" was corrected, but "thorns—fawns," "water—shorter" were left. *Nom de plume* dies hard.

Desiderius Erasmus concerning the Aim and Method of Education. By Prof. WOODWARD. (Cambridge University Press.)

There has been of late years what we may well call an Erasmus revival. It began with the brilliant and captivating, but inaccurate and one-sided, "Life and Letters of Erasmus," first delivered as lectures by Mr. Froude when he was an Oxford Professor in 1893. Since then we have had Emerson's Life—a fine product of American scholarship, Sir R. Jebb's Rede Lectures, and, last and chiefest, the "Epistles of Erasmus" by F. M. Nichols (here misspelt Nicholls), of which two volumes have appeared.

Prof. Woodward, following up his original study of Vittorino, has here attempted only one aspect of Erasmus's many-sided personality, but that, as is now generally acknowledged, the most important. "In all his work," says Prof. Jebb, "his aim was essentially educational." We have, by way of preface, a brief biography; the body of the book is a full exposition of the educational doctrine; Part II. contains the "De Ratione Studii"—strange to say, the first English version—and the "De Pueris statim ac liberaliter instituendis," which was translated into English within twenty years of its publication, but is virtually inaccessible. The English student has here for the first time the opportunity of acquainting himself at first hand with the doctrines of a great educational reformer, and, as the Professor strongly insists, all other study of educational history is not worthy of serious recognition.

More stress is here laid, and quite rightly, on the merits than on the defects of the reformer. It is difficult in the present age to do justice to an educator who made classical study the centre of his system, who despised modern languages as vulgar dialects, who knew nothing either of abstract or applied science, and, what is worse, was not conscious of his ignorance. There is no need to dwell on these limitations which are common to Erasmus and nearly all his contemporaries, but they need to be mentioned lest the encomia justly lavished on his plan of studies in comparison with what it superseded be taken as a recommendation of it to the present age. Erasmus was pre-eminently the man of culture according to Matthew Arnold's definition. He set before himself as the business of his life first to know and then to make known to others the best thoughts of the best minds. To use the antique world, "the glory that was Greece and the grandeur that was Rome," purged and purified by Gospel light, seemed to him the whole duty of man. He was, to use Quick's happy phrase, a verbal realist; in other words, he studies things through the medium of literature, and the world of Nature as apart from man was to him a book with seven seals. An Alpine pass is to him as it was to Livy, nothing but a dreary waste, and he relieves the tedium by composing Latin verses. He visits the Rome of Julius II. without being aware of the existence of Michael Angelo. And yet he was an innovator far in advance of his age. He bade men seek the truth at first hand, regardless of the glosses of tradition, and verify by their own observation and reflection the wisdom of the ancients. He freed the schools from monastic domination—"Schola publica aut nulla" was his watchword. He was a pioneer of woman's education. And, lastly, he may be claimed as the father of the reformed method of language teaching, the method that begins with oral instruction and subordinates grammar to reading.

"Home Education Series."—*School Education*. Vol. III.

By CHARLOTTE M. MASON.

This is a stimulating book, and at the same time an irritating one. Any one who knows Miss Mason, her views on education, and the work in it she has accomplished, will expect what he will certainly find here—great freshness and originality, a clear

and well defined system of education, the study of which cannot but be helpful to any teacher, and the power and charm of a pleasant and strong character. This is the stimulating part. The irritating part is a certain confusion that reigns throughout. Nothing sufficiently clear is told to the uninitiated about the Parents' Educational Union or the school, or schools, in which the ideas in this book are brought to the test of practice, and there is a complete haziness that is really comical as to whether Miss Mason is addressing *us*—the ignorant, outside general readers—or her own enlightened colleagues of the Union. The essays at one moment appear to be addresses delivered to the members of the Union, but at the next, *we*—the general reader—find ourselves receiving explanations as to the successful work the Union has done, and other information that cannot be got to fit in with the first theory on any terms. Then we are told the leading points in Miss Mason's theory of education over and over again; yet, in the end, we are left on many points in a state of confusion. Only by dint of exhaustive research do we at last grasp what she means by educating children on books. What else, we helplessly ask, have they been ever educated upon—at least, since books existed? At length we discover that the system is to supply the child with a large number of books to read himself, or, if he has not yet learnt the art, to have read to him. Then, again, Miss Mason calls her book "School Education"; but it is mostly about home training; and she completes our bewilderment by warning us not to mind the title, "Home Education Series," because it is only appropriate to Vol. I. of the series.

Nevertheless, it is to us a delightful book, and most readers will enjoy it. As to the theory, with much of it we are in hearty agreement, and we know that Miss Mason has obtained good results. Nevertheless, on several points we have our doubts. As to docility and obedience solely on the grounds of authority, we entirely disagree. In regard to the idea that the child should be given a very wide culture—as wide, in fact, as the possibilities of his interests—we should like to ask how the time is to be found for it in the school hours unless it is to be as shallow and slight as it is wide—a mere smattering. From most subjects a student gets little good until he has gone to a certain depth in them. Again, young children are to be given inspiring books—books full of ideas—to read. Our own experience is that most of such books are unintelligible to young readers. They understand neither the words nor the ideas introduced, to a great extent. In the lecture, or personal teaching, to which Miss Mason objects, the teacher brings the matter within the comprehension of the special children being taught. Few really valuable books are to be found that young children can read with pleasure themselves which will at the same time give them the knowledge and discipline required. However, as we say, the book is both stimulating and informing. No doubt, it is Miss Mason's own personality that makes her system succeed; this, unhappily, is usually the case with educational successes. Nevertheless, other teachers will derive much help from the views and suggestions her book contains.

A Student's Text-Book of Zoology, Vol. II.

By ADAM SEDGWICK. (Price 21s. Swan Sonnenschein.)

This second volume of the work from the pen of the well known Reader of Animal Morphology in the University of Cambridge deals with the subjects of the Cephalochordata (*Amphioxus*) and the Vertebrata. It is a highly technical work, and one which will be of great value to the higher student for whom it is intended. From the mass of information which has to find a place in its pages one necessarily expects—and gets—a somewhat compressed style, but the explanations and descriptions are clear, and their comprehension will be assisted by the series of illustrations with which the work is adorned. It is rather curious to find the writer apologizing in his preface for having possibly seemed to have taken up "an unduly critical position with regard to views widely prevalent at the present time on some aspects of organic evolution." We are not about to attempt the task of criticizing either these prevalent views or our author's criticisms upon them; but this we will say, that it will be an evil day for science when "prevalent views on organic evolution" or on any other scientific subject are set up as a dogma and it is considered sacrilegious to criticize them. So far from requiring an apology, we hold

that it is the bounden duty of every serious writer on biological matters to study with the most critical eye and to write in the most critical spirit respecting the subjects related to what is vaguely described as the evolutionary theory. By trying all things alone can truth be dragged from her hiding-place. She certainly will not be dislodged by tabooing any group of scientific theories. Two small points of criticism we will offer as suggestions. In the first place, we regret to find scarcely any notice of the myological peculiarities of different mammalian groups, though much work has been done in this direction of late, some of which, at least, appears to have been accepted by high authorities as of taxonomic value. It was perhaps hard, amongst the mass of facts clamouring for admittance, to find room for anything on this point, but we think that some reference to its bearing on morphological problems would not have been out of place in this work. Then, again, we find the Neanderthal and Spy men alluded to as belonging to "an extinct species" which is "not thoroughly known," but "clearly belongs to a lower grade of organization than *H. sapiens*." We are quite aware that this is the view of Schwalbe and one or two others, but, in face of the fact that Deniker—a better authority on that particular aspect of the question than Schwalbe—refuses to assign the Neanderthal skull to a place amongst Mousterian relics and in face of the wide differences of opinion existing amongst distinguished human anatomists as to the real nature of the crania in question, we submit that so definite and dogmatic a statement is hardly justified.

This is a point to which we cannot devote space in this notice, but we should like to invite the attention of the distinguished author of the work under review to it. We learn with gratification that he proposes to write a general work on "The Principles of Biology," and shall look forward eagerly to its appearance. Any work of a general character, such as we may expect under the title just mentioned, will be welcomed from the pen of so accomplished a critic and careful an observer as Adam Sedgwick.

Shakespearian Tragedy: Lectures on Hamlet, Othello, King Lear, Macbeth. By A. C. BRADLEY. (Price 10s. net. Macmillan.)

In his "Shakespearian Tragedy" Prof. Bradley "considers the four principal tragedies from a single point of view." The detailed consideration of these plays is preceded by chapters on the substance of Shakespearian tragedy, on construction in the tragedies, and on Shakespeare's tragic period. The book will be welcomed by all who have had the privilege of listening to his lectures at Glasgow or Oxford, and who must long have wished to possess the substance of those lectures in a permanent form for themselves and for a wider circle.

The dedication is "To my Students," and to such one of the great attractions of the book will be that it is written in the spirit not only of a scholar who has loved much and studied much, but of a teacher who desires to help others to see what he has seen; who therefore troubles himself to set at rest doubts as to the possibility of analyzing without murdering, or the danger of attributing conscious art to an inspired artist. He points the way for each student to study Shakespeare for himself. He is continually suggestive, as the great teacher always is, since his treatment of the subject is in touch with life. To take but one example: the passage on the witches in "Macbeth" seems at one with the spirit of Wordsworth's "powers that will work for thee." The clear thought and clear language of a teacher must add greatly to the value of the book for all, unless it be any belated Meno who prefers talk of fluid emanations to anything of which he can say: "But that is so simple, Socrates!"

Yet there are doubts and objections which may arise in the mind of the appreciative reader who fully realizes how much he is being made to see where he never saw before. In Prof. Bradley's words, Shakespeare "looked at this secular world most intently and seriously; and he painted it, we cannot but conclude, with entire fidelity, without the wish to enforce an opinion of his own, and, in essentials, without regard to any one's hopes, fears, or beliefs." In the works of a dramatist who had "this fidelity in a mind of extraordinary power" men and women live and move for us, and the best way for us to rejoice in them and learn from them is to live with them and seek to understand each detail of their life and thought with the minute care of love. Yet it need involve no

confession that to us such characters as Hamlet or Othello are unreal to acknowledge that we cannot know of their lives as we can of men and women of flesh and blood.

They are the inhabitants of a world of thought, and to carry too far a consideration of the material circumstances which might have influenced their thoughts and conduct would be to fall into something of the same mistake as that, on a lower level, of seeking to know the nature of the men and women round us by an examination of their blood corpuscles. It may be there are connexions, but they are so remote that attempts to establish them may prove at best unprofitable. It is with deference that we suggest that Prof. Bradley has occasionally laid himself open to such criticism, though less, perhaps, in spirit than in letter.

Such notes as that on Othello's courtship are nothing but illuminating; of other passages (some of the remarks on Hamlet, for example) we feel more doubt. But, as to this matter, Prof. Bradley states his own view—"though it is quite possible that Shakespeare never imagined any of these matters clearly, and so produced these unimportant difficulties, we ought not to assume this without examination"—and there is never any trace of pedantry in his analysis of such details. Suspicion of any such thing is dispelled when we turn to his lectures on "King Lear."

In his inaugural lecture at Oxford Prof. Bradley spoke of poetry as embodying "in its own irreplaceable way something which embodies itself also in other irreplaceable ways, such as philosophy or religion," and again, "This unique expression, which cannot be replaced by any other, still seems to be trying to express something beyond itself, and this we feel is also what the other arts and religion and philosophy are trying to express." His treatment of "Lear" strongly recalls this passage. "Lear" he considers inferior as a drama to the other three tragedies, yet in one way greater than any of these, and the fullest revelation of Shakespeare's spirit.

He treats the play with an extraordinary insight and helps us to realize how its very imperfections as a drama and its obscurity and contradictions in detail are, in a way, evidences that it is a work scarcely to be assigned to any one region of art, so closely is it allied, in the spirit of it, to that something of which each art is but a partial manifestation. In "Lear" we have great world movements, heard again in Beethoven's later works, or in a Brahms' symphony. It is by looking at it thus as something beyond a drama that we can see how it deals the very death blow to pessimism. The worst of suffering has happened, but here "adversity, to the blessed in spirit, is blessed." "In the world the only real thing is the soul, with its courage, patience, and devotion. And nothing outward can touch that."

After reading such passages as these, which "take us to the very heart of Tragedy," it is salutary to remember the warning Prof. Bradley himself gives us at starting. "We cannot arrive at Shakespeare's whole dramatic way of looking at the world from his tragedies alone." Tragedy, even as Shakespeare sees it, does not give us the whole truth of life any more than "As You Like It" or "Winter's Tale." Life can only be looked at as it is in "King Lear" because those other ways of looking at it are also true.

Shakespeare has been with us some three hundred years, but, as with the Bible, we can never reach to the full significance of all he has to give us in works embodying some of those permanent truths which are kept young and fresh for ever in the light of fresh experience and knowledge. And it is difficult in any way to estimate the value of such a book of original criticism as Prof. Bradley's. It seems to us to be the work of a philosopher and an exact and far-seeing scholar, who writes in the spirit of the best of former Shakespearian critics (of Goethe, Coleridge, and Charles Lamb), and on whom their mantle has fallen.

"English Men of Letters."—*Sydney Smith.* By GEORGE W. E. RUSSELL. (Price 2s. net. Macmillan.)

When Mr. George Russell was a Harrow boy, his father, Lord Charles Russell, no mean judge of literature, gave him the "Collected Works" of Sydney Smith, exhorting him to study them as models of forcible and pointed English. "From that day to this I have had no more favourite reading."

These are the credentials that Mr. Russell presents as a monographist, and we can desire no better. Not many of the present generation have even looked into the "Collected

Works," and Sydney Smith, like Talleyrand in France, has left a name to point an epigram or father a doubtful joke. His true greatness as a pamphleteer is forgotten, and Mr. Russell has done good service in reviving the memory of the Peter Plymley and Archdeacon Singleton Letters. To those of an older generation, like the present reviewer, who possess the "Works" and occasionally read them—though not with the lifelong devotion of Mr. Russell—the page after page of quotation will be resented as a piece of otiose book-making. In a monograph we look for criticism and characterization—not for elegant extracts.

On the political side of Sydney Smith's career—the part he played in the carrying of Catholic Emancipation and the Reform Bill—we do find some illuminative comments. Mr. Russell has, in his time, played the game of politics and understands the ins and outs. Yet even here we miss the judicial attitude. Mr. Russell leaves the impression (we are sure it is a false one) that he endorses the grotesque travesties of the Whig pamphleteer who paints Canning as nothing more than a small table-wit and Spencer Percival as a monster of jobbery and self-seeking.

To Sydney Smith as a Churchman Mr. Russell appears to us to do both more and less than justice. In condemning his Arminianism, his ignorance of the meaning of "Catholic," his lax and loose theology, he does not make sufficient allowance for the age. On the other hand, it is only in the broadest sense of the word that Sydney Smith can be called "a genuinely religious man." He entered the Church, to use his own phrase, as a *pris-aller*, and to the end he regarded the services and ordinances of the Church—shall we say as Charles Lamb regarded the India Office? An anecdote, which we give on the authority of the late Mr. Rogers, of Bishopsgate, is significant. Sydney Smith was staying with a country squire of the name of Kershaw, and one Sunday at breakfast he laid a wager that he would make the company laugh in the course of his sermon. The sermon was staid—in fact, soporific—till, just at the close, the preacher, pretending to sneeze, gave vent to a stentorian "kershaw" and won his bet. We know from Boswell how Dr. Johnson would have viewed such levity.

Of Sydney Smith's conversational powers we may say, as Mr. Russell says of Sir Leslie Stephen's biography, "he has added little to what was already known." This is the biographer's misfortune, not his fault. The witty author of "Collections and Recollections" has had here no scope for his better half.

The Works of Charles and Mary Lamb. Edited by E. V.

LUCAS. 7 vols. (Price 7s. 6d. per vol. Methuen.)

Lovers of Lamb—and they multiply instead of decreasing with years—will rejoice at the completion of this unique library edition, which includes, with some unavoidable exceptions, all the published work of Lamb and his sister, much that had appeared anonymously and has by the indefatigable editor been authenticated as Lamb's, and, besides, near a century of letters now printed for the first time. A complete edition it cannot claim to be for various causes. The law of copyright forbids the inclusion of many letters; other letters are withheld through the dog-in-the-mangerishness of autograph collectors; and there is always the chance that further reviews and fugitive pieces may be traced among the files of old newspapers or recovered from forgotten magazines. For the perfect edition we must wait at least another generation. Meanwhile, we may well be content with an edition which gives us for the first time the dramatic specimens, which includes "The King and Queen of Hearts" discovered by Mr. Lucas, in addition to all the children's books of brother and sister, and reproduces all the original illustrations. Add to this annotations which are at once full, concise, and pertinent. No modern author stands so much in need of an annotator as Lamb. He is, indeed, rarely obscure, but he is as allusive as his favourite Burton. He quotes from memory, like Bacon, and his quotations, even those in inverted commas, are often echoes rather than transcripts. There is in Lamb's case the further difficulty of determining how much is *Dichtung* and how much *Wahrheit*. He delights in throwing dust in his reader's eyes. In his autobiography he romances, and under the garb of romance he paints his very self. He never idealizes himself like Goethe or poses as the *fanfaron de ses crimes* like Rousseau; but he takes a childish delight in playing at hide-and-seek and mystifying his readers.

Throughout Mr. Lucas is a safe guide. He gives us the missing word, and never a word too much. No subsequent discoveries can cancel our debt to Canon Ainger. He was the first explorer and served Lamb as Boswell served Johnson. Mr. Lucas, if we may pursue the analogy, has played the part of Dr. Hill. Not only has he made fresh discoveries, but he has restored the text in passages which had been expurgated by a clerical editor as improper or profane. We have noted a few misprints. In Vincent Bourne's verses, Vol. I., page 337, read "audit" for "auditi" and "aut" for "ant." On page 487, the translation of Prudentius cannot stand: *impune qualifis tutili, not cadentium*.

Personal and Ideal Elements in Education. By HENRY CHURCHILL KING. (Price 6s. 6d. Macmillan.)

The title is somewhat of a misnomer; for there is very little about education in the book. The first sixty-three pages contain the author's presidential address in Oberlin College, May 13, 1903, in which the spiritual aims that should be included in University education are dwelt upon. The remaining 210 pages are on religious subjects, and education is only incidental in this connexion. We heartily agree with the author in his concern for the ideal and spiritual side of life in a time in which, superficially at least, machinery, commercialism, and practical materialism are dominant; but we cannot say that this book shows more than good feelings, good intentions, and much earnestness. Nearly everything true it contains has been said better and more concisely before. The essays were all originally spoken addresses, and may have been more impressive when heard than they are when read.

The Infant School: its Principles and Methods. By J. GUNN, M.A., D.Sc. (Price 3s. 6d. Nelson.)

This is an excellent and complete book on its subject. It gives a thorough account—as far as psychology can assist us—of the important features of the nature and mind of a young child and his growth—physical, mental, and moral. It is written, moreover, with much sympathy with children and experience of them, while the tone of the whole book is thoughtful, observant, and minutely careful. All the various sides of infant-school work are dealt with in detail—kindergarten work and plays, object-lessons, drawing, singing, reading, &c., and most valuable practical information and suggestions are given on each. We have rarely seen a book in which the psychological side and the practical school side are both so well done, and in which the views of the purpose of education are so high, while the methods suggested are fully explained and feasible. It ought to be of the greatest value to every teacher of young children and to mothers.

Oberlin and his Educational Work. By H. HOLMAN. (Price 1s. Charles & Dible.)

Mr. Holman has done an excellent piece of work in writing this biography of Oberlin. A quotation from the preface will show the spirit in which the whole book is written. "Oberlin was a man who in a remote place and with small means founded and maintained a complete system of social and moral instruction which raised the people from a condition approaching barbarity to a level of civilization previously unknown in such a district. He caused the children of the poor to be well and generously educated at a time when it was thought unnecessary and dangerous to give any education whatsoever to such. And yet he is a man of whom little is known from an educational standpoint; though he is always referred to as the real founder of infants' schools, whenever this question arises. It is time that a man whose life and work are so well worth knowing was well known." The story of educational progress is often concerned with the biography of great philanthropists. Mr. Holman points out, however, that the story of Oberlin contains elements which, in their heroic devotion to the cause of the infants, disclosed a work and a personality which throw light upon the science of education, through their sheer humanism, and the insight into helpfulness which may come through love as well as through trained knowledge and the study of methods. Oberlin is a study in humanism, for, though he had been well educated, it is his charity and breadth of human sympathy that especially attract. "He was ever a friend of the helpless, the outcast, and the defenceless. He received the poet Lenz into his household when he was suffering from mental disorder and watched over him with the greatest tenderness." We read: "He shakes hands with all the little children as he passes them in the street, speaking particularly to them individually." And again: "I never met with anything like the cultivation of mind amongst poor people as in his village." Mr. Holman has written *con amore*, and all educationists will be glad to read the story of this man, who in his life-time did so much educationally, by sheer personal influence. There are several interesting illustrations, a bibliography, and a useful index by Mrs. Holman. The book is published at one shilling net.

The Epistle of St. James. With an Introduction and Notes. By R. J. KNOWLING, D.D. (Pp. lxxx, 160; price 6s. Methuen.)

Dr. Knowling has in this volume given us an admirable commentary. It is a model of lucid and scholarly exegesis. We are especially grate-

ful for this, as there was a real need of a competent and well balanced commentary on this Epistle. Dr. Mayor's well known work, though valuable and elaborate, is very one-sided. The introduction (pp. l-xxx) is thorough and critical. The writer, while emphasizing the Jewish character of the Epistle, rightly insists that it is essentially a Christian document. The theory that it is a Jewish work with slight Christian interpolations (championed by Spitta and others) is very adequately dealt with. The writer also maintains its early date (before 60 A.D.) and identifies its author with James "the Lord's brother"—the James of Acts xv. and Gal. i.—whom he regards as not having been a member of the Twelve. There is also a most interesting discussion of the question of the "Lord's brethren." Dr. Knowling inclines to the Epiphonian theory—which also numbers among its advocates the late Bishop Lightfoot—and regards the "brethren" as being the children of Joseph by a former marriage, and, therefore, the elder brothers of Jesus. Some very effective criticism of the rival theories follows. In the last section of the introduction—"Modern Life and some Aspects of the Teaching of St. James"—there is much that is stimulating and wise which will appeal to the modern mind. Space forbids quotation. It is almost superfluous to add that the notes on the text are models of clear and scholarly exegesis. They bear evidence at every turn of ripe knowledge and critical acumen. At the same time they are framed in untechnical language, and will therefore meet the needs of the intelligent general reader as well as appeal to the professed scholar and theologian. To the latter the book will prove indispensable. While popular in the best sense of the term, it is a real and notable contribution to scientific exegesis.

Spanish Correspondence and Technicalities. By W. N. CORNETT.
(Price 2s. net. Hirschfeld Bros.)

The title explains the ground covered by this excellent manual. Any student who works through this book in accordance with the compiler's suggestions, and so makes himself master of its contents, will be fully qualified to act as Spanish correspondent in a business firm.

Spanish Commercial Practice. Part I. By GRAHAM and OLIVER.
(Price 2s. 6d. Macmillan.)

A summary of the contents of this compilation will be sufficient to show its great utility. In addition to ninety pages of Spanish correspondence—followed by a sound English translation thereof—there are thirty-nine pages of questions (in Spanish) upon business affairs and twenty-eight pages of suitable matter for translation into Spanish. Much care has been bestowed upon the selection and arrangement of the subject-matter, and—not a common combination—the compilers know not only Spanish, but also the *technique* of business.

The Saga of the Sea Swallow. Told by MAIDIE DICKSON.

Illustrated by I. D. BATTEN and H. FAIRBAIRN. (Innes & Co.)

If the author of "The Sea Swallow" should chance on the admirable paper "Concerning Children's Books" contributed by Miss Gertrude Slater to the January number of *The Journal of Education*, a glow of righteous self-satisfaction ought to reward her pretty bit of work, though the work itself is so good as to suggest that her inherent modesty would prevent any such fervour of self-appreciation. For in these charming tales of adventure and of love there is the healthy poetry of high courage and faithful endurance. Here, too, we find wider scenery and more varied companionship than in those school-room tales where, as Miss Slater points out, the very fact that the heroes and heroines are all children is apt to make the moral atmosphere somewhat limited and unwholesome. To an ignorant reviewer it seems that Miss Dickson's use of the Norse mythology is so skilful and able that her beautiful modern "Saga" might easily be mistaken for old Norse traditions. And of the story of Greenfeather the Changeling, the fairy who for love gave up all hope of a soul and found, to his surprise, that his soul had been born in the act of renunciation, it may be truly said that it is a fairy tale worthy of Hans Andersen and of the masterly illustrations with which Mr. I. D. Batten and Miss H. Fairbairn have adorned the volume. The use made of Irish folk-lore in the "Changeling" story is as clever as the interweaving of Norse mythology in "The Saga"; and there is a fascinating picture of little Norah riding the "Pooka." If it be correct, by the way, that *pucca* is Welsh for "fairy," it suggests a question as to how far *pucca* and "Pooka" and "Puck" and "pixie" may all be related.

"Blake's Historical Charts."—No. 1, *General Chart of English History, 1066-1903*. No. 2, *Contemporary European Rulers, 1066-1903*. (Bacon & Co.)

These charts can be had in four forms—in paper covers plain, the same coloured, mounted on cardboard, and on cloth, rollers, and varnished. They are drawn to scale, an inch to every forty years, events being given vertically. The plan is excellent for showing graphically the relation of events, but it sets at defiance Scott's sentiment—

"One crowded hour of glorious life
Is worth an age without a name."

The print is too small for them to be serviceable for form teaching, but, with a small class and still more to the private student, they will prove a valuable aid. The price is most reasonable, ranging from 9d. to 3s. 6d. net.

"Blackie's Modern Language Series."—*Practice in Conversational French.* By F. S. GROSSE and HOWARD WEBBER.

These conversations are well schemed as an introduction to everyday French, but we do not see much use in Part III.—the questions in English to which the dialogues give the clue. There are some careless blunders which should be corrected in another edition. On the first page we find, "les malles que j'ai fait enregistries," and in the next dialogue "hors d'œuvres," though correctly given as "other hors d'œuvre" in the English.

Le Théâtre à l'Ecole. By Mrs. J. G. FRAZER.

(Price 1s. Macmillan.)

Three pretty little plays. Mrs. Frazer combines three qualities rarely combined among writers of school books—knowledge of French, knowledge of children, and wit. The second play, which turns an old and not over decent *fabliau* into an innocent modern farce, is capital.

A Handbook of French Dictation. By D. A. WYNNE WILLSON.

(Price 2s. Blackie.)

The actual passages for dictation occupy less than half the volume. The other half consists of rules of pronunciation, accidence, and syntax with illustrative examples. This is obviously better than the usual method of choosing a passage at random, with or without hints from the teacher. The book is well planned and well graduated. The portion on pronunciation will require to be supplemented by Paul Passy or some more systematic handbook of phonetics, and it seems to us a mistake to put the verse before the prose. Otherwise we have nothing but praise.

"Bell's Miniature Series of Great Writers."—*Chaucer.*

By Rev. W. TUCKWELL. (Price 1s. net.)

We happened the other day to be present at a discussion on whether Chaucer was a suitable subject for school study. The disputants ranged themselves into opposite camps—school teachers who held that he was the most stimulating of poets for the young, and University professors who held that to those who knew no Early English Chaucer must be a closed book. Mr. Tuckwell is clearly on the side of the teachers, and his booklet goes to show how a little learning may go a great way towards the appreciation of our first—and, in some ways, our greatest—national poet. Perhaps he makes too light of the prosody, which, as a misquoted line of Matthew Arnold shows, is not his strong point; but he has a true sense of Chaucer's greatness as a poet and a storyteller, and we can heartily recommend the book to beginners.

The World of To-day. By A. R. HOPE MONCRIEFF.

(Gresham Publishing Company.)

This is the first volume of a series to be completed in six volumes issued quarterly. The published price is 8s. net, but no order can be accepted except for the entire work. It is, perhaps, impertinent to offer publishers advice on their own business, but we cannot help thinking that, if the first volume had been purchasable separately, the sale would have been largely increased. Assuredly there is good money's worth if we reckon only the maps, cuts, and reproductions of photographs so plentifully supplied. We mention them as the feature that first strikes the eye, but the text is no less attractive. Mr. Moncrieff has the happy art of mixing grave and gay. He has gone to the best authorities and the latest books of travel for his information, and he weaves his information together in an easy and graceful narrative. Centres of interest vary from year to year, and when the work was started Korea and Manchuria were little known and less cared for. Their changed aspect since the war broke out is not ignored, but slightly treated. For the teacher of geography the book will prove a valuable aid, affording him not only the latest statistics, but plentiful illustrations of life, manners, and customs.

Les Aventures d'Ulysse. A Reading Book. By G. G. COULTON.

(Hachette.)

This is a Reader on a plan which we hope to see more generally adopted. Mr. Coulton has taken Bètaube's translation of the "Odyssey" as his basis, and, instead of supplying notes, has adapted the text for young readers. As Herbart maintained, there can be no better book than the "Odyssey" for the first stage of instruction, and the book will legitimately serve a double purpose—to impart a knowledge of French and to familiarize a modern class with the best story in the world. (Questions for *viva voce* and passages for retranslation are added at the end.)

Angier-Sandeau: La Pierre de Touche. Edited by H. W. PRESTON.
(Price 8d. Blackie.)

From a school point of view this is an excellent play—a fund of idiomatic French—though, regarded simply as a play, we should hardly assign it so high a rank as the editor. The villain of the piece is a monster redeemed by no virtue, and it is incredible that he should ever have composed the inspired symphony which is the mainspring of the action. For the annotation we have nothing but praise: the real difficulties are pointed out, and there are no constricts and no padding.

Letters of Thomas Gray. Vol. II. By DUNCAN C. TOVEY.

(Price 3s. 6d. G. Bell.)

This volume contains the letters from 1758 to 1762 inclusive, together with those of Mason during the period. Gray is mostly resident in

London, though his headquarters are at Pembroke College, and he pays frequent visits to distinguished friends. His only publications during these years are "The Progress of Poesy" and "The Bard." Mr. Tovey has done well not to pursue the literary quarrel that loomed large in his first volume, but he cannot resist a final fling. Gray writes to Mason: "Tell me what to do with your Zumpe"; and Mr. Gosse suggested that it is a noun derived from the sound of the verb *zombare*, "to thump" or "bang." Whereon Mr. Tovey: "It is a pity that all this erudition should be thrown away. Zumpe is simply the name of a pianoforte maker. People said 'a Zumpe' as they now say 'a Broadwood' or 'an Erard.'" The notes show the same close acquaintance with the eighteenth century and the same painstaking research that commended the first volume. We have only noted two or three unimportant misprints, such as Fénelon with a superfluous accent.

Conjugation of French Verbs regular and irregular; same of German, Italian, Spanish Verbs. (Price 6d. net each. Hirschfeld.)

Convenient booklets bound in paper that may be carried in the pocket and coned at odd moments. There is no attempt at scientific classification, and it seems to us a waste of space to give the English of each person.

The Intermediate French Reader. Edited by MAURICE GEROTHWOHL. (Price 2s. 6d. Murray.)

This Reader is founded on "French Principia," Part II., but is virtually rewritten. The first half consists of short extracts, mainly on natural history; the second part of chapters from the history of France. For those who like extracts we can recommend the volume, which is well printed and cheap. A good feature is the keeping apart the historical notes (in French) from those on grammar. The latter, we think, might well be dropped.

German Strong Verbs and Irregular Weak Verbs. By CARL HEATH. (Price 1s. Blackie.)

The tables are conveniently printed with a headline to each verb in black type thus—

brechen (To break), *brechend*, *gebrochen*.

We fail, however, to see the use of giving the present participle or the tenses in full. It would be well to note the verbs conjugated with *sein*.

(1) *An Introduction to the Theory of Optics.* By ARTHUR SCHUSTER. (Price 15s. net. Edward Arnold.) (2, 3) *A Text-Book of Physics.* By J. H. POYNTING and J. J. THOMSON. *Sound.* Third Edition. (Price 8s. 6d.) *Heat.* (Price 8s. 6d.) (Griffin & Co.)

These three volumes are of very similar character and may fitly be dealt with in the same notice. They are all by men whose names are household words amongst physicists and who are equally distinguished as investigators and as teachers. Their names are sufficient certificates of the excellence of their writings, and one need not, therefore, waste space in commending the three books mentioned above to the educational public. Indeed, that one of them has already commended itself to that public is proved by the fact that it has arrived at its third edition before either of the other parts of the series of which it formed the first volume had seen the light. In spite of the title of the first book upon the list, "An Introduction," &c., it must not be supposed that these are school books. They are meant for students of the University level and presuppose—especially the first of them—a considerable acquaintance with mathematics. The subject of optics, with its underlying theories, is one which requires a clear, definite, and magisterial exposition at the present day, though, as Prof. Schuster himself points out, the problem of light will only be solved when we have discovered the mechanical properties of the ether. Meantime, there is no man better qualified than Prof. Schuster to explain to students the exact position of knowledge at the moment; and we can commend his book, as well as those by Profs. Poynting and Thomson, to teachers of all grades and to higher students of the subject of physics.

The Cambridge Natural History.—Fishes, Ascidiæ, &c. (Price 17s. net. Macmillan.)

This, the latest volume of "The Cambridge Natural History," is not less interesting or valuable than its predecessors in that important series. It contains articles on the "Hemichordata," by Dr. Harmer, one of the editors of the series; on "Ascidiæ and Cephalochordata," by Prof. Herdman, of Liverpool; and on "Fishes." The section on "Cephalochordata" relates, of course, to the dozen or so species of "Lancelets," the *Amphioxus* so much dealt with by the text-books and so valuable to the student of vertebrate morphology. But the greater part of the book deals with the subject of fishes, and of that part the lion's share falls to Prof. Bridge, of Birmingham. In fact, the entire subject falls to his lot, save for an article on the "Teleostei," which is contributed by Mr. Boulenger, of the British Museum. Prof. Bridge has long been known as one of the most active workers in England on the subject of ichthyology, and it appears to us that his work, as now given to the world in this volume, is worthy of his reputation. For the most part the book, like its predecessors, is one for the advanced student or a work of reference for the general biological library, and in

both these directions it will be deservedly welcome. But even the general reader will find much to interest him in the accounts of the various kinds of fishes, and especially in the description of their outward form and coloration. We should like to call special attention to the chapter on "The Air-sac"; for Prof. Bridge is known to have made a special study of that singular and interesting appendage, and anything that he has to say upon it is worthy of all attention.

Gautier: Prose et Vers. Edited by F. B. KIRKMAN. (Price 6d. Black.)

Gautier is an artist born, and the advanced French pupil can have no better model. The defect of these selections is that the prose and verse are *disparate*. The animal stories from the "Ménagerie intime" are easy enough for a fourth form boy; most of the poetry is fitted only for the sixth. The notes (in French) are brief and to the point. We have marked one or two errors. *Le grand retour* is not the return after Austerlitz, but the escape from Elba. *Vin clair* is not "pale," but "clear, clarified wine." *Nyctalope* is not "night-blind," from *nyct*, "blind," but "night-seeing," from *nyx*.

We have received from Messrs. Stanford a mounted *Orographical Map of Lancashire and Cheshire* on the scale of 2 inches to the mile. Heights are marked by various shades of brown, and an excellent idea is presented of the general lie of the country. Towns of over 100,000 inhabitants are indicated by *hachures* of light red. These are liable to be confused with the browns, and we should have preferred black. There is a praiseworthy parsimony of names, and the map will satisfy all the requirements of the teacher of physical geography.

BOOKS ON GEOMETRY.

- (1) *Elementary Geometry: Practical and Theoretical.* By C. GODFREY, M.A., and A. W. SIDONS, M.A. (Price 3s. 6d. Cambridge University Press.) (2) *Solutions of the Exercises in Godfrey and Sidons's Elementary Geometry.* By E. A. PRICE, B.A. (Price 5s. Cambridge University Press.) (3) *Solid Geometry.* By Dr. F. HOEVAR. Translated and adapted by C. GODFREY, M.A., and E. A. PRICE, B.A. (Price 1s. 6d. Black.) (4) *A School Geometry, Parts I.-V.* By H. S. HALL, M.A., and F. H. STEVENS, M.A. (Price 4s. 6d. Macmillan.) (5) *Theoretical Geometry for Beginners, Parts III. and IV.* By C. H. ALLCOCK, M.A. (Price 1s. 6d. each part. Macmillan.) (6) *A New Geometry for Schools.* By S. BARNARD, M.A., and J. M. CHILD, B.A. (Price 4s. 6d. Macmillan.) (7) *Experimental and Theoretical Course of Geometry.* By A. T. WARREN, M.A. (Price 2s. Clarendon Press.) (8) *Plane Geometry Practical and Theoretical.* Books I., II., and III. By J. S. MACKAY, M.A., LL.D. (Price 2s. 6d. Chambers.) (9) *Elementary Geometry, Parts I. and II.* By C. HAWKINS, M.A. (Price 2s. each part. Blackie.) (10) *Elementary Pure Geometry, with Mensuration.* By E. BUDDEN, M.A., B.Sc. (Price 3s. Chambers.) (11) *Geometry on Modern Lines for Elementary Students.* By E. S. BOULTON, M.A. (Price 2s. Methuen.) (12) *A New Geometry for Beginners, Theoretical and Practical.* Second Edition. By R. ROBERTS, B.Sc. (Price 1s. 6d. Blackie.) (13) *First Lessons in Observational Geometry.* By Mrs. W. N. SHAW. (Price 2s. Longmans.) (14) *Preliminary Geometry.* By R. ROBERTS, B.Sc. (Price 1s. Blackie.) (15) *Practical Geometry for Beginners.* By W. LE NEVE FOSTER and F. W. DOBBS. (Price 2s. 6d. Macmillan.) (16) *Elementary Plane Geometry.* By A. BAKER, M.A. (Price 2s. Ginn.) (17) *An Introduction to the Study of Geometry.* By A. J. PRESSLAND, M.A. (Price 1s. Rivingtons.) (18) *Examples in Practical Geometry and Mensuration.* By J. W. MARSHALL, M.A., and C. O. TUCKEY, M.A. (Price 1s. 6d. Bell.) (19) *Constructive Geometry.* By J. G. KERR, LL.D. (Price 1s. 6d. Blackie.) (20) *Practical Geometry, with Mensuration.* (Price 1s. Oliver & Boyd.)

We have before us more than a score of new text-books on geometry, most, but not all, of them inspired by the recent reform in the methods of mathematical teaching. It is a welcome feature that the authors are connected with all the different types of secondary schools. Eton, Winchester, and Haileybury are represented by their senior mathematical masters and others; Harrow, Rugby, Charterhouse, Clifton, Dover, and the Edinburgh Academy by assistant masters; the Technical Colleges of Bristol and Derby by mathematical lecturers; and the Higher-Grade School at Darwen by its Head Master.

(1) Among the recent additions to our geometrical library, a high place must be assigned to this book. It follows very closely on the lines adopted by the University of Cambridge, and the authors are well qualified for giving expression to the new regulations, as one of them served on the Syndicate by which they were recommended. As most of our readers are probably acquainted with the scheme, we need say no more than that the first book deals with angles at a point (Euclid I. 13-15), parallel straight lines (I. 27-30), and triangles and rectilinear figures (I. 32, 4, 26, 5, 6, 8, 18, 19, 34, &c.), the second book with areas, the third with the circle, and the fourth with similarity. There is a good introduction on experimental

geometry, and the exercises in the theoretical portion are appropriate and numerous—so numerous indeed as almost to bury the propositions out of sight. It is one of the advantages of the new arrangement that the earliest theorems provide far more exercises than were possible with the old order. The proofs also are in most cases shorter, less tedious for the examiner to peruse, and, with one exception, present no undesirable difficulty to the beginner. The exception is, however, an important one and occurs almost on the threshold, and it is unfortunate that the authors should be obliged to recommend its omission on the first reading. The rest of the first book is well ordered and interesting. The same may be said of the third and fourth books, except that we think it would have been better at the first introduction of the tangent to have considered it as the limit of the secant. The second book, on areas, is the least satisfactory part. It is even duller than the second book of Euclid. Taking the work as a whole, however, it is freshly written; as an introduction to the principles of geometry it has few rivals. At the same time, we think that it leads the young student too easily along; difficulties are anticipated too freely; it is a less efficient means of mental discipline than some of the admirable editions of Euclid published during the last ten years.

(2) The exercises in Godfrey and Siddons number nearly two thousand. The great majority of them are so easy that it is doubtful whether any useful purpose is served by the publication of a key. This remark does not, however, apply to the numerical examples, the answers to which may save teachers some trouble. The book is printed in the same clear manner as the original. The diagrams are even better.

(3) The course of elementary geometry being shortened by the recent changes, solid geometry may be begun a year or more earlier than before, and on this account a simpler and less formal treatment than usual may be desirable. Dr. Hocevar's work, which is here translated and adapted to English wants, is a natural sequel to the "Elementary Geometry" of Messrs. Godfrey and Siddons. We can only regret that the editors should have gone abroad for a text which they could have written equally well or better themselves.

(4) There is some of the familiar look of Euclid in Messrs. Hall and Stevens's "School Geometry." The order is, of course, different, involving a corresponding change in some of the proofs, but about one half of the theorems are practically unaltered. There is also a resemblance to Euclid in the preference for a logical order of propositions adapted to beginners rather than for a too rigid grouping according to subjects. In a period of transition, such as that through which we are passing, many teachers will prefer a book the authors of which favour a gradual reform and "follow the Example of Time it self; which indeed *Innovateth* greatly, but quietly, and by degrees, scarce to be perceived." We have now before us the whole book, so far as concerns plane geometry—the sixth part, on solid geometry, being in preparation—and we have no hesitation in recommending it as a textbook written without haste, containing no stumbling-blocks for beginners, and yet making sufficient demand on their powers of independent thought. In the first part we have the usual propositions on lines and angles, parallels, triangles, and parallelograms; in the second the propositions on areas contained in the first book of Euclid, with additions. Part III. deals with the circle, and the authors have adopted the wise plan of giving alternative proofs of the properties of the tangent depending on its definition as the limit of a secant. In Part IV. they return to areas, and especially to those propositions originally contained in the second, third, and fourth books of Euclid. The only change that we could wish to see in this part is the addition of short alternative proofs of Euclid II. 4-7. The last part, on proportion, relates, as is now usual, to commensurable magnitudes only; and contains useful appendices on maxima and minima, harmonic section, pole and polar, &c. Throughout the book theorems and problems are separated; and the exercises are generally duplicated, the first set being numerical and graphical, the second theoretical.

(5) Another book of the first order is Mr. C. H. Allcock's "Theoretical Geometry for Beginners," the third and fourth parts of which we are glad to welcome. The former contains the theorems and problems on areas in the second, third, and fourth books of Euclid, with some additions; the proofs of the second book theorems being purely geometrical, but avoiding Euclid's tedious use of the diagonal. It also includes a chapter on the radical axis. The fourth part treats of proportion, on the basis of commensurable magnitudes, and of its applications in modern geometry. This latter portion, especially, is of great value and interest; the subjects of maxima and minima, inversion, the complete quadrilateral, &c., being discussed at much greater length than usual, and illustrated by admirable series of examples. The diagrams are neat and clear. Before deciding on any new textbook, teachers would do well to give Mr. Allcock's work a very careful examination.

(6) There are many points of resemblance between the work of Messrs. Barnard and Child and that which stands first on our list. One of the authors served both on the sub-committee of the Mathematical Association and on the Syndicate appointed by the University of Cambridge. Their book is divided into three parts. The first, a brief one, relates to the fundamental concepts of geometry. The

second gives at some length practical constructions with proofs, together with proofs of those theorems required to give coherence to the whole. The third, or theoretical, section includes, with some additions, the course of theorems recommended by the Cambridge Syndicate; and in parts is therefore identical with the scheme followed by Messrs. Godfrey and Siddons. There is the same preliminary obstacle in the fourth proposition (Euclid I. 27), but the proof here is briefer and more difficult; and the treatment of the theorems on areas is the same. The chief difference between the two books lies in the higher standard aimed at by Messrs. Barnard and Child. The exercises are wider in their range of difficulty, and more advanced theorems are introduced. The volume is well printed, but the diagrams are in white on black ground, a change that can hardly be called an improvement. Nevertheless, the book is in many ways an admirable one, and, in the race for preferment, is sure to take one of the front places.

(7) The volume last noticed has been re-issued in two parts, of which we have received that designed for junior forms or for candidates for the Oxford and Cambridge Junior Local Examinations. It is not, however, merely a reprint, for it contains several additional sections, and the introductory exercises begin without formal definitions. In its division into three sections it corresponds with the larger work. The ground covered by it is roughly that of Euclid I., III. (1-31), and part of IV.

(8) The experimental and theoretical portions in Mr. Warren's volume divide it into two nearly equal parts; but, in the latter, he has followed the useful plan of giving references to corresponding articles in the experimental course, so that the two parts may, if desired, be studied concurrently. Attention should be directed to the care with which, in the first part, the constructions and measurements lead up to the "conclusions drawn"; so that the pupil is led to discover for himself the properties which he is afterwards to prove. In the second part, considerable use is made in the proofs of methods depending on the folding of the figure about a line or on its rotation about a point in its plane. Geometrical proofs of the theorems in the second book of Euclid are replaced by illustrations of some algebraical identities, and the tangent is treated as the limit of a secant. We must confess to an old-fashioned prejudice in favour of denoting lines and angles by letters, rather than by ticks or other marks placed upon the figures.

(9) One of the best editions of Euclid is that by Dr. J. S. Mackay, of the Edinburgh Academy, and we are glad to see that he has brought out a course of plane geometry in which all that is of value in the first four books of Euclid is retained. Only eighteen pages are given to practical geometry, an abbreviation with which we are inclined to agree. With regard to the theoretical portion of the book, we need only say that we have seen nothing better, and that the section on areas leaves little to be desired. A new feature appears in the short section on geometrography, the object of which is "to discover which of the various ways of solving a problem is the simplest, or, in other words, which way requires us to perform the fewest number of operations."

The remaining works on our list must be noticed somewhat more briefly. (10) We are indebted to Mr. Cecil Hawkins for an interesting course of plane geometry on the lines suggested by the Cambridge Syndicate. A few of the proofs might be made more simple and direct. The usual order of the theorems on parallels (Euclid I. 27 and 29) is inverted, but without any gain in simplicity. The discussion of areas follows the lines of the Cambridge report. Tangents are treated as the limits of secants. There are numerous and varied exercises. (11) In a volume of less than 300 pages Mr. Budden gives chapters on experimental geometry, plane geometry, trigonometry as far as the solution of triangles, pure geometry (inversion, harmonic and polar properties, cross ratios, involution, perspective), geometrical conics, and solid geometry. The compression is too great. It is more an encyclopedia than a text-book of geometry. (12) Mr. Boulton introduces his readers with rapidity to the principal theorems of plane geometry, but his treatment is not altogether satisfactory, especially in the section on parallelism. If a course of geometry must be short, it is better to err on the side of too little than too much. (13) Mr. Roberts's little book has evidently supplied a want. It was first published in 1902, reprinted twice in 1903, and we have now a second edition, in which considerable additions have been made in order to meet the requirements of various examinations. (14) Mrs. Shaw's "First Lessons" were originally given as lectures at the Cambridge Training College for Women, and are well worthy of the wider circulation which they are sure to attain. It would be difficult to imagine a more helpful book for young teachers.

Our last seven books are on practical geometry. Any one of them would form a good introduction, and the teacher's choice will no doubt be guided mainly by expense and the time he intends to give to the subject. (15) In his "Preliminary Geometry" Mr. Roberts gives a short introduction on lines, angles, triangles, quadrilaterals, polygons, and circles, which cannot fail to be useful. (16) Messrs. Foster and Dobbs's "Practical Geometry for Beginners" is a valuable work. The first part is intended to be studied alone, the second in conjunction with a text-book on theoretical geometry, such as that by their colleague

Mr. C. H. Allcock. The authors have limited themselves, and wisely, to the subject-matter of the first book of Euclid. (17) In Prof. Baker's "Elementary Plane Geometry" we have the views of an American teacher, which coincide very nearly with those that have been recently acquired here. The need for accuracy in drawing is strongly insisted on; and the exercises are arranged so as to lead up to the discovery of geometrical properties. (18) In his brief "Introduction," Mr. Pressland assumes no more than that his reader can sharpen a pencil, and teaches him rapidly to draw geometrical figures with accuracy and to recognize some of their properties. (19) The "Examples" drawn up by Messrs. Marshall and Tuckey have been in use for some time in Charterhouse. There are no diagrams, and instructions are left to the teacher to supply. (20) The "Constructive Geometry," by the Head Master of Allan Glen's School, Glasgow, provides a course for the first year, corresponding to the subjects of the first three books of Euclid. (21) The last book on our list, which is not acknowledged by its author, covers a wider range: there being chapters on the ellipse, on solid geometry, and on the construction of graphs.

The Teachers' Rabelais. By GERALDINE HODGSON.
(Price 1s. Blackie.)

In a small volume of eighty pages Miss Hodgson, in a free and somewhat curtailed translation, gives us the chapter of Gargantua bearing on education. The introduction discusses, in a broad-minded spirit, Rabelais' place in the history of education, and points out in particular the close connexion between him and Erasmus.

English Works of Roger Ascham. Edited by ALDIS WRIGHT.
(Price 4s. 6d. net. Cambridge University Press.)

The "Scholemaster" and "Toxophilus" have been many times reprinted, and of the former Prof. Mayor has given us an admirable edition. The third of Ascham's works, "Report of the Affaires and State of Germany," is known to few. It would be impertinent to praise Dr. Aldis Wright as an editor. He has done well to correct *in situ* all the printer's errors in Greek and to give the other errata of the original copies in an appendix.

Murray's Small Classical Atlas. Edited by G. B. GRUNDY.
(Price 6s.)

The most striking feature of this new "Atlas" is its extreme clearness, due partly to the good type and partly to the use of coloured contours instead of *hachures* for mountains. We note, besides, plans of fourteen battlefields. These are hardly detailed enough to be of much use to the student of military history. On the other hand, Rome and the Forum have a page to themselves and embody all the latest explorations. If we compare Mr. Grundy's "Atlas" with the "Butler" of our schooldays, we shall be duly impressed with the strides made not only in cartography, but also in cheapness.

(1) *Contes des Chevaliers.* By Mrs. J. G. FRAZER. (Price 1s. 6d.)
(2) *Dumas' Les Aventures de Chicot.* (Price 2s.) (A. & C. Black.)

These are two volumes in the "Cours Élémentaire," both of them supplied with what we may term the *apparatus modernus* by Mr. F. B. Kirkman. The first consists of modernized stories from the "Chansons de Geste," including the beautiful romance of "Amis et Amile." The second, edited by Mr. A. R. Florian, we have already noticed in the first edition.

Select Tales of Hans Andersen. Edited by the Rev. H. J. CHAYTOR.
(Price 2s. Blackie.)

The notes are few, but sufficient, and there is a full vocabulary. Also exercises for retranslation, excellent in quality, but a little scanty in quantity. It makes an attractive volume. The only feature for which we do not care is the illustrations.

French Poems for Children and Beginners. By A. THIRION.
New Edition, Revised and Enlarged. (Price 6d. Hachette.)

These infantine poems are well adapted for learning by heart and forming the basis of a conversation lesson. They are nearly all poems of sentiment or moral fables, and will appeal more to a class of girls than of boys. An English boy will be shy of declaiming how he came home with a proud First and asked, as a reward, of his father a dog and of his mother a kiss.

Les Français du dix-huitième Siècle. By JETTA S. WOLFF.
(Price 1s. 3d. E. Arnold.)

This sequel to "Les Français d'autrefois" is a political—and not, as the title would suggest, a social—history. Mlle. Wolff writes simply and abstains from reflections, but, to our mind, the narrative is too crowded with facts. We have one serious complaint. The vocabulary is composed with little or no reference to the text. We tested it by page 13. The pupil who trusts to the vocabulary will begin his translation: "A deaf scolding (*grondement sourd*) made itself heard," and continue: "In this moment of disorder Dominus struck him with a blow of a knife. The blow failed. Wits (*les esprits*) felt themselves disposed to an *accommodement*." The last word is missing, as are *avant-coureur*, *procédé* in the same page. What possible use can such a vocabulary serve?

Faith of the Church and Nation. By the Right Rev. A. F. WINNINGTON INGRAM. (Price 3s. 6d. Wells Gardner.)

This volume of addresses and sermons by the Bishop of London is in part an answer to Canon Henson. It upholds the miraculous element of the New Testament in its plainest literal sense. To criticize or decide between the two divines is beyond our province, and all we need here say is that the Bishop impresses us by his sincerity and good faith. Old Blues will be glad to possess the Bishop's farewell sermon to Christ's Hospital.

Hazell's Annual for 1905. (Price 3s. 6d. net. Hazell, Watson, & Viney.)

The able editor studies the art of compression, no less valuable in a work of reference than the art of comprehension; and this year's issue is actually shorter by thirty pages than that of 1904. Under "Education," in addition to the usual statistics, we have special articles on the Passive Resistance Movement, Wales and the Education Act, and the new Regulations for Secondary Schools. On the other hand, if when so much is good we may hint some faults of omission, we can find no reference to the questions that most exercised the minds of secondary teachers during the past year—the Greek question at Oxford and Cambridge, Leaving Certificates, the conditions of Registration, the College of Preceptors' Federation Scheme. Surely, too, Mr. M. E. Sadler and his quasi-official visitations deserved a paragraph.

"Illustrative History."—*Tudor Period.* Edited by N. L. FRASER, B.A.
(Price 2s. Horace Marshall.)

This excellent little volume is intended to give some picturesque details, impossible to include in a text-book. The selections are well chosen, and not hackneyed, and include passages from the Venetian Rolls Series, Roger Ascham, Burnet, More, Roper, and others, as well as from the more familiar Scott and Macaulay. The illustrations are good.

"Illustrative History."—*British and Old English Period.* Edited by E. J. BALLRY, B.A., A.C.P. (Price 2s. Horace Marshall & Son.)

Uniform with the preceding, and the selections as wisely chosen and suggestive, those from Du Chaillu's "Viking Age" being especially interesting. Everything that brings the Scandinavian element in our race into prominence is valuable. The illustrations again are good.

"The Jack Historical Readers."—Third Book: *The Tudor Period.* By A. R. TILLEY, F.E.I.S. (Price 1s. 6d. T. C. & E. C. Jack.)

This is a good book, well printed and illustrated, and with several coloured pictures, somewhat gaudy perhaps, but all the more attractive to children for that, in spite of æsthetic opinion. It contains the words and music of a "Psalm invoking Divine aid against the Armada"—both good, the tune being really a fine one.

Helps to the Study of Milton's Areopagitica and English Sonnets.

By C. W. CROOK, B.A., B.Sc. (7¼ × 5 in., pp. xxxii, 98, 40; price 2s. Ralph, Holland, & Co.)

Mr. Crook is Head Master of the Higher-Grade School at Wood Green, and is worthily known as the editor of some of Shakespeare's plays. In the book before us he has supplied a good preface and introduction, and a set of notes which he elects to place at the foot of the page. The book is really two books, so that the sonnets have an introduction and a body of notes of their own. These are fairly adequate. The little volume is interleaved, and is provided with indexes.

Bacon's Advancement of Learning. Book I. Edited, with Introduction and Notes, by ALBERT S. COOK. (7¼ × 5 in., pp. lvii, 145; price 3s. 6d. Ginn.)

Mr. Cook, who is Professor of the English Language and Literature in Yale University, has supplied us with a good preface and introduction, including Rawley's "Life of Bacon," and critical estimates of Bacon by Nichol, Huxley, Brewster, Abbott, &c.—all very much to the point. The notes are partly taken from Mr. Selby's edition, with the elementary portion omitted, and partly are Mr. Cook's own; in either case they are good. They are written with care and judgment, and show a good knowledge of the matters to which Bacon refers.

"The Academy Shakespeare."—*Much Ado About Nothing.* With Introduction and Notes by T. E. MARGERISON, M.A. (7 × 4¼ in., pp. 164; price 1s. 6d. W. & R. Chambers.)

Messrs. Chambers have come to the conclusion that it is time to abolish the old editions, and to bring out, under Mr. Patrick, M.A., LL.D., an entirely new preparation of the plays. This is the second volume of the new venture. The introductory matter and the notes discharge their respective offices fairly well.

"Round the World."—*America.* By JOHN KELLY. (7 × 4¼ in., pp. 264; price 1s. 6d. T. C. & E. C. Jack.)

A good book, with very poor illustrations, fair type, and paper toned to the right colour.

"Pitman's New Era Geography Reader."—*The World.* (7 × 4¼ in., pp. 280, xxxii; price 1s. 10d. Sir Isaac Pitman & Sons.)

This is a prettily got up and prettily bound volume. The illustrations are for the most part good—some very good; the paper and binding are excellent. It seems in every way suited to carry out the purpose for which it was needed.

"Longmans' British Classics."—*Macaulay's Essay on Bacon*. Edited by DAVID SALMON. (7 × 5 in., pp. xxvi, 252, illustrated with portraits; price 2s. 6d. Longmans.)

Mr. Salmon is, as our readers know, the Principal of the Swansea Training College, and the editor of a goodly list of books for schools. He gives us in the book before us an edition of one of the most faulty of the essays which Macaulay wrote. It is set forth mainly, we suppose, to be studied as an example of his style and manner rather than as a record of fact and opinion. Most of Macaulay's wilful and egregious errors of statement and of view are revealed in the notes; but Mr. Salmon has evidently not spent his night with "a reviewer," nor is he aware of the amount of error his text contains. His eyes are fixed on the fashioning of the essay, and that must be his justification. Taken in that sense, his edition is a good one, and is provided with all the necessary outfit. The index is sufficient, and the illustrative portraits are adequate.

UNIVERSITIES AND SCHOOLS.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL.

The following prizes for the winter session 1904-5 have been awarded:—Second year's students: W. B. Johnson, the William Tite Scholarship, £25; third year's students: R. W. Rix, the Musgrove Scholarship, £35; J. A. Clark, College Prize, £20; H. A. H. Robson, College Prize, £10; fifth year's students: C. L. Morgan (medicine), £10; H. T. Gray (surgery), £10; J. M. Wyatt (midwifery and diseases of women), £10; G. J. Langley (pathology), the Hadden Prize, £10; H. T. Gray and L. E. C. Norbury (pharmacology), £5 each; L. E. C. Norbury (forensic medicine and insanity), £10; G. J. Langley (public health), £10. The Mead Medal and the Seymour Graves Toller Prize for proficiency in practical medicine, pathology, and hygiene were awarded to G. J. Langley; the Wainwright Prize to H. R. Dean; the Cheselden Medal for proficiency in surgery and surgical anatomy to L. E. C. Norbury.

GIRTON COLLEGE, CAMBRIDGE.

Entrance scholarships have been awarded on the result of the recent examination in the following order of merit:—The Clothworkers' Exhibition of £60 a year for three years and one additional term, to Miss A. Shillington (Queen's College, Belfast) for classics and Anglo-Saxon; the Skinners' Scholarship of £50 for three years to Miss M. Long (North London Collegiate School for Girls) for mathematics; College Scholarships of £30 for three years to Miss M. G. Tonkin (North London Collegiate School for Girls) for French and German; and to Miss C. Green (City of London School for Girls) for natural sciences; a Pfeiffer Scholarship of £20 for three years to Miss A. Woodward (University College, Nottingham) for classics; College Exhibitions of £15 for three years to Miss I. M. Mathews (Sheffield High School) for mathematics, Miss E. H. Pratt for French and German, Miss N. B. Drummond (St. Leonard's School, St. Andrews) for history, Miss M. Davies (King Edward's High School, Birmingham) for classics, Miss E. J. Ewart (Liverpool University) for classics, Miss L. Warren Jones (Blackheath High School) for mathematics, Miss M. G. Calthrop (Blackheath High School) for French bracketed with Miss I. M. Massey (Tottenham High School) for German.

OXFORD.

SOMERVILLE COLLEGE.—The following elections have been made to scholarships and exhibitions at Somerville College:—To a Clothworkers' Scholarship of £50 for three years, Helen F. Miller, Oxford High School (mathematics); to a Gilchrist Scholarship of £50 for three years, Dorothée de Zouche, Liverpool High School (classics); to the Edith Coombs Scholarship of £50 for three years, Matilda Snow, Oxford High School (classics); to exhibitions of £20 for three years: Margaret C. Berry, private study (French); Violet Burton, Cheltenham Ladies' College (English); Arminella Hansell, private study (English); Annie M. Payne, South Hampstead High School (classics); Effie Kyle, Roedean School, Brighton (classics).

LADY MARGARET HALL.—The following scholarship awards have been made:—To Olive W. Sinclair, High School, Clifton, the Jephson Scholarship of £50 for three years (mathematics); to Annie C. Heath, Ladies' College, Cheltenham, the Mary Talbot Scholarship of £40 (English literature); to Helen Gifford, Allenswood, Wimbledon Park, a scholarship of £30 (modern languages); to Dorothy K. G. Watkins, Durham University, bracketed equal with Miss Gifford, an honorary scholarship (classics). The scholarships offered for competition in March, 1906, are a Jephson Scholarship of £50; the Old Students' Scholarship of £40; a scholarship of £35; and one of £25.

ST. HUGH'S HALL.—The Clara Evelyn Mordan Scholarship of £40 a year for three years has been awarded to Frances M. Knipe, St. Stephen's High School, Clewer, and Edgbaston High School (English literature), and a Hail Scholarship of £25 a year to Emily M. Dugan, St. Margaret's School, Bushey (mathematics). A scholarship of £25 a year for three years is offered for competition in March, 1906.

MANCHESTER.

During the present University session two notable series of lectures to acting teachers have been given in addition to the course by Prof. Sadler on the organization of secondary education, to which reference was made last month. The first, by Miss Burstall, Head Mistress of the Manchester High School, treated exhaustively of the "Oversight of Girl."

Mr. Paton followed last term with three lectures on "Some Ethical Problems of School Life." These lectures dealt, in a delightfully fresh manner, with the problems of discipline, punishment, and moral training. Opening with the statement that the doctrine of evolution had enabled us to reconcile the Puritanical view of human nature with that enunciated by Rousseau, the lecturer concluded by defining the aim of the teacher as "helping the pupil to find his true self."

The Council of the University have appointed Mr. Stanley Dunkerley, M.Sc., to the Chair of Engineering. After a brilliant career at Owens College, Mr. Dunkerley held appointments in the Universities of Liverpool and Cambridge respectively, and in 1897 was appointed Head of the Department of Applied Mathematics in the Royal Naval College, Greenwich, where he recently superintended the building of the new engineering laboratory.

Prof. Schuster is acting as Chairman of an Executive Committee charged with formulating proposals for the establishment of an international association for the investigation of solar physics. Prof. Strachan, who was recently appointed Lecturer in Celtic to the University, is the compiler of "Selections from Old Irish Glosses"—a text-book in use in Ireland and America and on the Continent.

The educational exhibit of the University, which was awarded a gold medal at the St. Louis Exhibition last year, is to be deposited in the Victoria and Albert Museum at South Kensington.

As already reported here, the Matriculation Examination of the three Universities of Manchester, Liverpool, and

Leeds is still conducted by a joint board, who have this year issued their first *Calendar*. With the object of diminishing the number of examinations for scholarships, as well as of securing that scholars shall have their college course free for real University study, the Joint Matriculation Board have not only given to the various Education Committees facilities to use the Matriculation Examination for the award of scholarships—adding, where desired, more advanced papers—but they have also recently announced their decision to award a scholarship of £30, tenable for three years at the University, on the results of the July examination. In consequence of these steps, a number of the scholarships given by the Education Committees (as well as a number of separate scholarships at the two Universities) are to be awarded on the results of the same examination.

The Victoria Church Hostel for Women Training Students has been licensed as a hall of residence for the University. The general question of a new hall of residence for men students has been raised once more by a post-card canvass of all the men in rooms. It is estimated that £60,000 would be required. In addition to this, it is contemplated that £20,000 will be required for the men's and women's wings of the new Union Buildings. Towards the latter, a bequest of £5,000 has already been made.

At the Grammar School an honour has fallen to an old boy in the award of the Travelling Studentship of £200 to O. Hertz at Oxford. In the Classical Moderations lists three Old Mancunians appear, one in the First Class and two in the Second. The Founder's Day sermon is to be preached this year by Rev. Canon Skrine, late Warden of Glenalmond. Three new departures take place this year in connexion with the school sports. The High Master, Mr. Paton, has for some time been organizing weekly harriers' runs, and the term concluded with a successful steeplechase over a course of five miles, in which Mr. Paton assisted. This is the first the school has had, and a feature of the run was the number of boys from the preparatory form who took part. Simultaneously a School Rowing Club has been successfully set on foot, and a number of boys have passed the necessary swimming test. Lastly, as intimated last year, important changes will take place in the organization of the annual athletic sports. The system of individual prizes is to be abolished, and boys will be encouraged to compete for the honour of their forms rather than for individual distinction. For this purpose the forms of the school are to be organized in four divisions, for each of which a trophy will be provided. The lectures, of which the boys have had about fifteen since Christmas, are now concluded.

The pictures exhibited at the Municipal Ruskin Exhibition have been loaned to the school and are displayed in the corridors. The musical societies are rejoicing in the welcome, but unexpected, arrival of a new grand piano. The instrument, which is by Dörner, is the gift of the Misses Gaskell. The annual school concert took place on April 13, the *pièce de résistance* being a successful performance of Somervell's "Joan of Arc."

At the Broughton and Crumpsall High School the change in the hours recommended by H.M. Inspectors is reported to be working well. The long morning has been abolished, and the day divided into periods of three and two hours respectively. The term concluded with a successful performance of "As You Like It" by the elocution class.

At the Whalley Range High School the Governors have recently made alterations with the object of providing better accommodation for the senior girls and for the old girls' associations.

At the Municipal Secondary School recently opened, and which has taken the place of the Higher Grade Board School, efforts are being made by the Head Master to create and foster a corporate life by means of scientific and literary societies, athletic clubs, and a school magazine. The school has now been formally recognized by the Board of Education. Mr. Paton recently addressed the boys on the importance of building up a good school tradition.

This new organ of the Municipal School of Commerce continues to furnish an excellent means of communication for the students of this flourishing institution. In connexion with the School of Commerce as well as the School of Technology and the School of Art, a syllabus of summer evening courses in a large number of subjects has just been issued. In addition to the ordinary courses in science, architecture, engineering, &c., the syllabus announces lectures on such subjects as dressmaking, horticulture, micrometallurgy, microscopic fungi, and horse-shoeing; and weekly field excursions are arranged for the botany and geology classes.

An illustrated synopsis of the course of lectures on "Aims and Methods of Teaching Drawing to Elementary Classes" forms a pleasant souvenir of a movement which drew together an audience of some seven hundred teachers on six successive Saturday mornings.

The Report, just received, of a detailed inspection of the School of Art and the School of Technology made last year speaks in high terms of the efficiency of the schools. The Board of Education grants received last year showed an increase on those of the preceding year of £2,753 and £285 for the two schools respectively.

This court has now been in operation for three months, and during that time about seventy children under the age of fourteen years have been dealt with. The court is held in a quiet ante-room, and is made as simple as possible. An industrial schools officer is present, and the magistrate is able to talk kindly and familiarly with the juvenile offenders, who are frequently committed to the local industrial schools, or, in extreme cases, to those at a distance.

Among a large number of articles and letters on the question of underfed school-children which have appeared during the month, two deserve special attention. The first is a long letter from Miss Mary Dendy, who is eminently qualified to speak on the subject. The writer asserts that it is not those who pay single visits to poor schools who are qualified to speak on the matter, but those who spend their lives in dealing with the children and their parents; that the reason why only half the number of free meals were given in Manchester last year as compared with the preceding year was not that funds were low, but that a more rigid inquiry was enforced; that there is such a pitiable overlapping of charities that enough is given to feed the children several times over; and that the miserable condition of the children is often the result not of poverty, but of ignorance and foolish indulgence. The other communication comes indirectly from the Education Committee's medical officer, who states that, in his opinion, the question of underfeeding has been a good deal exaggerated. He also emphasizes the distinction between improper feeding and underfeeding. The important inquiry now proceeding will deal with about twelve thousand children, and will include full information as to the amount and the causes of underfeeding.

Regret has been felt at a decision of the Parks Committee not to continue their grants of soil, &c., to the Children's Window-Gardening Society. In consequence, there was no alternative but to wind up the Society, through whose agency over fourteen thousand children during the last two years have received grants of pots, soil, and seed.

The Chairman of the Manchester Education Committee presented the annual budget on April 18. This showed that the expenditure last year had amounted to £130,157 for higher, and £400,309 for elementary, education. Towards these sums the Government grants contributed £224,404. It

is estimated that on the rate of the current year it will be necessary to raise £300,135. The estimates were approved.

At the Salford Education Committee the question of school fees has again been under discussion. The decision is that it is undesirable to abolish them. The Independent Labour Party have petitioned the Committee to abolish corporal punishment in the schools.

At the first meeting of the newly constituted Lancashire Education Committee the following recommendation of the Higher Education Committee was adopted:—
"That the appointment or dismissal of an assistant be made by the governors of the school, after receiving and considering the recommendations of the head master." The Elementary Sub-Committee urge the necessity for an amalgamation of schools for high-standard purposes.

WALES.

The annual general meeting of the W.C.S.A. was held at Shrewsbury on April 7 and 8. The President, Mr. Trevor Owen, in his address said that the time was not far distant when the reflex effect of the more liberal scales of salaries for assistant masters and mistresses now being adopted in England would make itself powerfully felt in Wales, and to prevent that migration of their best and most experienced teachers which the wider and larger prospects of English schools tended to bring about some method must be devised in Wales for improving their status and making their position freer from harassing financial anxiety. Referring to the proposed Welsh National Council for the control of education, he said that the most alarming feature was the absence of any guarantee that "persons of experience in education" would be interpreted to mean persons who possessed real and expert knowledge of education derived from actual experience in teaching. Unless such experts were put on, it would be impossible to prevent democratic control of education from degenerating into bureaucratic tyranny. He strongly deprecated the movement to hand over the powers of local governing bodies to County Education Authorities. Much of the success of the County schools had been due to the activity of the local governors, and any step that would diminish local interest in the schools would be detrimental to their prospects.

The question of the differentiation of boys' and girls' curricula was discussed very fully. Miss Jones, Wrexham, who read a paper on the subject, was of opinion that the strain on girls was excessive, due to the attempt to force the curricula of boys on girls without modification. She urged that more attention should be paid to domestic subjects and less to mathematics. The science course, too, for girls should be different from that for boys: botany, following on general elementary science, was more suitable for girls than the physics and chemistry which they were so often taught in conjunction with boys. Her views met with general acceptance, with the exception of the contention that the amount of mathematics for girls should be reduced. One speaker maintained that one of the characteristics of women was a "fatal inaccuracy," which a devotion to mathematics would help to correct, an opinion which, somewhat to the surprise of the audience, was supported by so eminent an authority on education of girls as Miss Collin, Head Mistress of the Cardiff Intermediate School for Girls.

It was resolved: "That this Association reaffirms its belief that actual teaching experience in secondary schools should be regarded as an indispensable qualification for inspectors and examiners of secondary schools, and regards with great misgiving any departure from this principle." Some recent appointments made by the Central Welsh Board transgress this principle. Miss Collin, Cardiff, was elected President for 1905-6, and Mr. T. R. Dawes and Mr. Jenkyn Thomas were re-elected Treasurer and Secretary respectively.

The Default Act has been put into operation at last in Merionethshire. The Board of Education has made payments to three schools in respect of expenses for which, in the opinion of the Board, provision should have been made by the Local Education Authority. It is said that an instalment of the new aid grant under Section 10 of the Education Act became due on April 1, and that it has been held back by the Board to make good the sums which they have paid to the three schools and intend to pay to other voluntary schools. There seems but little doubt that the men of Merioneth disagree with Mr. Lloyd-George's policy, although (or because) the fact is strenuously denied. They do not seem to intend to do anything that the exponents of the "Welsh National Policy" at Cardiff threatened to do. In fact, they are calling a convention at Bala to consider what "national policy" shall be adopted. Their plan of campaign is said to be "a rigid enforcement of all powers exercisable by the Local Education Authority under the Act." Structural requirements will be enforced and made as onerous as possible. Nonconformist children attending Church schools will be drafted into Council schools where such exist, and in areas served by Church schools only Nonconformist opposition schools will be opened. Finally, the action of the Board of Education in withholding grants will be challenged in the law courts.

Mr. F. E. Battersby, M.A., senior assistant master, has been appointed Head Master of the Newport Intermediate School. The method by which the Newport Education Committee proceeded to fill up the vacancy caused by the resignation of Mr. T. W. Phillips has been very adversely criticized in Wales. The vacancy was advertised in one newspaper only, a local halfpenny evening paper, and a very short time was allowed intending candidates to send in their applications. The reason alleged was that the matter was very urgent. In spite of this urgency, however, the appointment was not made for several weeks.

Mr. John Price is retiring from the Principalship of the Bangor Normal College after many years of most strenuous and successful work, which has left its impress on Wales. The Council of Cardiff College has to appoint a Professor of Education instead of Prof. Raymont, whose departure from Wales is much regretted by all educationists. The authorities of Aberystwyth College are about to elect a Registrar to succeed the late Mr. Mortimer Green, and a Superintendent of Women Students in place of Miss Carpenter, who is resigning the post which she has so long filled with such distinguished ability and tact. In Welsh educational appointments, it is very curious to watch the attitude of those who are loudest in their advocacy of Welsh nationalist ideals on the platform. As a rule, they are uncompromising in their opposition to candidates of Welsh extraction, particularly if they are engaged in educational work in Wales. This is very noticeable in connexion with the Superintendentship of Women Students at Aberystwyth. Some ladies who are engaged in educational administration in Wales and cry "Cambria contra mundum" when reporters are present, have the audacity to assert that there is actually no qualified Welsh candidate for this post.

Revolts are becoming as common in Wales as they are in South America. The latest is that of the elementary teachers of Glamorgan against the regulations of the Glamorgan Education Committee. At a meeting on April 15 they declared that they viewed "with indignation the humiliating and pernicious policy of the Glamorgan Education Committee towards its teachers," and there was some strong speaking in support of the resolution. Miss E. P. Hughes, a prominent member of the Committee complained of, was present at the meeting, and vigorously defended her colleagues, observing that the terms in which the resolution was couched were not "moulded in her standard of good taste, and were impolite, if not inappropriate, in view of the relationship which existed between the teachers and the Education Committee."

The promoters of the Welsh Education Council are not having their own way everywhere. Some counties—among them being Merioneth and Carmarthenshire—will have nothing to do with it, and nowhere is there at present any marked enthusiasm in its favour.

The elementary teachers of Wales have every reason to be satisfied with the N.U.T. Conference at Llandudno, with its first Welsh President (Mr. Tom John) in the chair. His presidential address was much appreciated, though the subject was such as could not be treated in the light, airy vein in which he excels.

SCOTLAND.

The difficulty of making any progress with the proposals for the institution of a three-term session, and for the reform of the Arts curriculum, has led to movements in the direction of obtaining greater freedom for the individual Universities in Scotland. It is recognized that the interests and needs of the various Universities are by no means identical, and that it is unjust to keep them in a position in which they must either move all together or not move at all. The curriculum and the arrangement of terms which may be convenient for Glasgow or Edinburgh may not suit Aberdeen or St. Andrews, and yet the present system compels the four Universities to have identical regulations. The only reason for maintaining this identity is that it is a protection against the competitive cheapening of degrees. This reason may have had a certain amount of force before 1889, when there was no preliminary examination. But the existence of a joint preliminary examination, on a high standard, tends to turn competition in the opposite direction, as students who have passed the preliminary will naturally be attracted to the University which offers the best rather than the cheapest degree. As to the necessity for greater freedom in the Universities, there is not a very general agreement; but opinions differ as to the best method for obtaining it. On the motion of Prof. Henry Jones, the Glasgow University Court has appointed a committee to consider the question, and this committee seems likely to advise procedure by way of an Act of Parliament. A similar movement is being made at Edinburgh and St. Andrews; but its promoters think that an amendment of the Arts ordinance, supported by the four Universities,

will give a large amount of liberty, and will be much more easily obtained, while it may prepare the way for an Act of Parliament at some later time. The fate of the Scotch Education Bill, which is almost unanimously approved in Scotland, is an illustration of the difficulty of getting Parliament to take action. On the other hand, those who are in favour of the Act of Parliament maintain that the obtaining of a partial liberation will make it more difficult to get complete freedom afterwards. There is much to be said on both sides; but it is to be hoped that, as there is substantial agreement regarding the object to be attained, the movement may not be wrecked by a difference of opinion as to methods.

A beautiful gallery of casts of ancient and Renaissance sculpture has been opened at Aberdeen. The collection has been admirably selected and beautifully arranged for educational purposes, and it will be of the utmost service both in the training of artists and workers in stone and as an adjunct to the teaching of the University. The example of Aberdeen might well be followed in every University town.

In recognition of his services to education and his long and successful career as a teacher, Principal Donaldson, of St. Andrews University, has been presented with his portrait, painted by Sir George Reid. The presentation was made by Lord Balfour of Burleigh, Chancellor of the University, who eulogized Principal Donaldson's work in the schools and Universities of Scotland.

Dr. John Hutchison, Rector of the High School of Glasgow, has been elected by the General Council as an assessor on the Glasgow University Court.

Mr. Robert Lamond, M.A., LL.B., has been appointed by the Glasgow University Court to be Lecturer on Evidence and Procedure in the University.

IRELAND.

Mr. Balfour's speech on the Irish University question in the House shortly before Easter had a tone of finality—as regards himself, at least. He declared that he was still of the opinion that the peculiar circumstances of Ireland rendered it advisable to meet the demand for a special University for Roman Catholics, though he did not consider that the "Stand and deliver!" attitude of those who were carrying on the agitation, and demanding the concession as a right, was justified, seeing that the establishment of a denominational University had not been conceded in other countries. However, he had entirely failed to convert his own party or his colleagues in the Ministry to his views. It was not merely Irish Unionists or Orangemen who objected, but an overwhelming majority in the United Kingdom. Hence he did not consider it was a measure that would be undertaken by any Government, nor did he think that time would make any difference in the state of public opinion. After this pronouncement, it can hardly be hoped that the Unionist party will undertake any legislation satisfactory to the Irish Catholic Church; while the Liberals, were they returned to power, considering the principles of their supporters, would be still less likely to do so.

There is the distant possibility that, if Home Rule were granted, the question might be settled in an Irish Parliament—a course which many Nationalists declare they would prefer, as the University so established would be less likely to be placed under the dominance of the Church. It is hard, however, to see—even if an Irish Parliament came into existence and passed the measure—where the funds would come from. If the British public are now adverse to giving public money for such a University, would they be less so if the University was established by a local Parliament?

Two courses remain open to those who sincerely wish the present condition of things in Ireland, disastrous to the culture and advancement of the whole community, to be speedily changed, either to endeavour to get such modifications in Trinity College as would make it as little objectionable to Catholics as are many foreign Universities to which they resort with the full sanction of the Pope, or to raise sufficient funds among Irish Catholics at home and abroad for a separate Catholic University, and then apply to the Government for a charter.

The former course would probably be feasible. An alteration in the government of Trinity College, giving the Junior Fellows and the Professors a share in it, the establishment of a second chair in Philosophy, and perhaps alternative courses in some few other subjects, would seem to be sufficient, and no reason except the greater dominance of the Church in Ireland than in other countries can be given why the attendance of Catholics in Trinity College should not then be sanctioned by the authorities who allow them to attend similar colleges abroad. Such a solution would, however, be violently opposed by the Irish Church, and probably the laity are too timid to withstand their disapproval.

The second course has already been suggested by Father Finlay. Probably the funds could be raised. If they could not, it would be a clear indication that the laity were not heartily desirous of a denominational University. Those who wish that the two sections of the Irish people, who have been so fatally divided and ignorant of

each other up to the present, should be brought into communion and mutual understanding, would regret such a solution, for it would confirm, perhaps, for ever, the "two camps" state of Irish social life.

A meeting of the Association of Catholic Graduates will be held on May 18, at which Mrs. Bryant will deliver an address on "The Future of Irish University Education, and the part of Irishwomen in it." Mrs. Bryant is an Irishwoman and a Nationalist, and in sympathy with the Catholic claims in higher education.

The Intermediate Board last month laid their programme for 1906 before the Consultative Committee of Head Masters and Head Mistresses recently formed, and invited them to give their views upon it in an interview with the Assistant Commissioners. Conferences of the heads of schools were held in Dublin, Belfast, and Cork previous to this interview, and the Consultative Committee represented the opinions so obtained at the conference with the Assistant Commissioners on April 5.

Miss A. Oldham, B.A., has, on account of pressure from other work, resigned her position as Honorary Secretary of the Association. Miss O. Rowleth, B.A., succeeds her. The Honorary Treasurer, Miss E. Webb, has also resigned, and her place is taken by Miss Davidson.

The Central Association was founded in 1881, and has done valuable work in the advancement of Irish education. Amongst other objects it has worked for and largely helped to gain are the opening of Trinity College to women, the extension of registration to Irish teachers, the establishment of an equal position for girls under the Intermediate system, the introduction of training for secondary teachers in Ireland. It also successfully opposed three successive Chief Secretaries who endeavoured to alienate some of the funds of intermediate education, and it has furnished much information and evidence for several Commissions that have sat on Irish education.

The Board of Trinity College, Dublin, with a view to co-ordinating intermediate and University education, have established exhibitions to be awarded on the result of the yearly Intermediate Examinations without requiring candidates to present themselves at the Exhibition Examination held in the College, and without any restriction as to the schools at which they shall have received their education.

Sir John Gardiner Nutting, Bart., has established ten exhibitions of £50 each per annum, tenable for two years, to be awarded in each of the years 1905, 1906, 1907, 1908, 1909, by the Board of Trinity College, Dublin, from amongst the persons, male and female, who distinguish themselves in the same year at either the Senior or the Middle Grade Examination of the Board of Intermediate Education in Ireland; and who shall, for at least two years previously, have regularly attended, and been educated at, an unendowed Irish secondary school. The Board will, accordingly, appoint from those candidates of either sex in the Senior or Middle Grade who shall have distinguished themselves at the Intermediate Examinations of 1905: twelve students to exhibitions, six of £20 and six of £15 a year for two years on the foundation of the Board; ten students from unendowed schools to exhibitions of £50 a year for two years on the foundation of Sir John Gardiner Nutting, Bart.

The Board lay down the following conditions for holding these exhibitions:—The holders must prosecute their course in Trinity College, must attend lectures and examinations, and must obtain Honours in some subject during each academic year. Exhibitioners need not necessarily reside in the College, but will, of course, be subject to the ordinary discipline of undergraduates. The Board desire that Intermediate exhibitioners or prizemen, willing to accept these conditions, will communicate with the senior lecturer as soon as the results of the Intermediate Examinations are known. The Board will proceed to the election before October 17 in each year. If the candidates nominated have not answered at their Intermediate Examinations in all the subjects required for matriculation in the College, they must qualify in the subjects which they have omitted.

The subjects required are:—(1) Latin, and any one of the following languages: Greek, French, and German; (2) English Composition; (3) English History and Modern Geography; (4) Euclid (I., II., and III.); (5) Arithmetic; (6) Algebra (elementary rules and simple equations). The exhibitioners must matriculate within two months of their election.

SCHOOLS.

CHELTONHAM LADIES' COLLEGE.—Violet Tryce Burton, a former pupil of the college, has obtained a literature exhibition of £20 for three years at Somerville College, Oxford.

CLIFTON COLLEGE.—The Council of Clifton College have lost no time in appointing a successor to Canon Glazebrook. The Rev. A. A. David, the Head Master elect, is Tutor and Dean of Queen's College, Oxford. He was for six years a Rugby master, and was second to Mr. Fletcher for the Head Mastership of Marlborough.

GROCERS' COMPANY'S SCHOOL, HACKNEY DOWNS.—The prizes were presented on April 15 by the Head Master (the Rev. C. G. Gull), who is about to retire after twenty-four years' service. The school is about to be taken over by the London County Council. Mr. Gull, in his parting speech, pleaded for the retention of the old name, which was associated with several distinct movements, such as music, drill, and shooting. He was assured that the London County Council would prove in the future not less liberal patrons than the Company had been in the past.

HARROW SCHOOL.—The entrance scholarships have been awarded as follows:—(1) For classics, C. E. S. Dodd, from Mr. E. T. Bull's, London; (2) for classics and history, E. E. F. Pretty, from Rev. H. W. Waterfield's, East Sheen; (3) for classics, G. K. M. Butler, from Mr. R. S. Goodchild's, Cambridge; for mathematics, (1) R. E. Pollock, from Mr. Morton Clarke's, Seaford; (2) F. D. C. Allen, from Mr. R. S. Goodchild's, Cambridge; (3) G. W. V. Hopley, from Rev. Dr. Malan's, Sandhurst. For modern subjects, F. J. Lambert, from Mr. M. Roderick's, Folkestone. The examiners for the school Scholarships (in classics, Mr. W. E. Heitland, M.A., Fellow of St. John's College, Cambridge; in mathematics, the Rev. W. Done Bushell, M.A.) have recommended J. R. M. Butler for the Gregory Scholarship, and R. O. Morris for the Spencer Scholarship. W. Worthington wins the Fifth Form Scholarship, H. M. Sonnenthal the Need Medal, R. A. Fisher the Baker Mathematical Prize, and H. B. Prior the Prior Divinity Prize. This term the athletic interest of this school is centred in fives, racquets, and the gymnasium. In fives one champion pair, after defeating Eton and Charterhouse, ended by beating Uppingham. Our racquet representatives did fairly, but were not good enough to win. At Aldershot we were second in gymnastics with 186 marks to Bedford's 189½, M. A. C. Halliday making the highest individual score. Mews and Griffin won the second place in boxing for heavy weights and middle weights respectively, and Kachorn was second in the fencing finals. (In the news of last month there was a misprint: the "Rev. F. C. Savill" should have been the "Rev. F. C. Searle.")

KENSINGTON GIRLS' HIGH SCHOOL.—Prize giving took place on March 31. Mr. F. W. Buxton presided. He congratulated the school on being one of the most important and profitable of the Company's schools, and referred to the increased responsibilities which would fall to the Company when it was converted into a trust. The scholarship awarded by the Company on the results of the Joint Board Examination was gained by Irene Hartnell.

UPPINGHAM SCHOOL.—At the examination held last term by the Rev. H. H. Sills, Fellow of King's College, Cambridge, the following were elected to entrance scholarships:—W. L. Alexander (£70), A. Graves and C. S. Browning (£50), M. N. Clark and C. L. Harrison (£40), and J. E. Ray (£30). Hon. Scholar, A. K. Priday; Rutland Scholar, J. W. Keswick. The following boys, still in the school, have obtained scholarships or exhibitions at the Universities:—H. V. Braham, classical scholarship, University College, Oxford; H. S. La Fontaine, classical scholarship, Caius College, Cambridge; G. H. Gaffikin, classical scholarship, Clare College, Cambridge; R. E. Lindsell, honorary scholarship (classics), King's College, Cambridge; H. A. Rose, classical scholarship, St. John's College, Cambridge; C. S. Hurst, classical exhibition, Pembroke College, Cambridge; A. F. Percival, exhibition, Caius College, Cambridge; and G. Tryon, mathematical exhibition, Pembroke College, Cambridge. G. Wilkinson has also within the last few days gained a musical scholarship at Caius College, Cambridge, and G. B. Tatham a history scholarship (third year) at Trinity College, Cambridge. On Thursday, March 30, the new Memorial Hall was opened by Lord Roberts. The day began with shortened Matins at 7.30, followed by a celebration of the Holy Communion. Lord Roberts arrived about eleven o'clock, and was welcomed in the schoolhouse quadrangle by the whole school, and H. V. Braham, captain of the school, presented an address. At noon the formal unveiling of the brass tablet containing the names of the Old Uppinghamians who had fallen in the South African War took place. This was followed by a gymnastic display and by speeches by Lord Roberts, the Head Master, the Marquis of Exeter, and Colonel Codrington. Great enthusiasm was shown throughout the day, not only by the school, but by the townspeople. Almost every house in the town was decorated with flags or otherwise to welcome our popular hero, whose courtesy and kindness during the whole of the proceedings, as well as in the cordial and warm interest shown by him, will not be easily forgotten by all who assisted in what was, indeed, a red-letter day for Uppingham School.

UNDERFERD CHILDREN.—The Order of the Local Government Board to Boards of Guardians on relief to underferd children reaches us too late for comment. We can only welcome in it the acknowledgment of the principle for which we have all along contended—that our first duty is to see that children are fed, and then, if possible, make the parents pay.

PRIZE COMPETITIONS.

The Prize for Literary Puzzles is awarded to "G.E.D."
Translation Prizes of One Guinea are awarded to "Teutwart,"
"Welcome," "Copa."

LITERARY PUZZLES.

1. "Il est bon de tuer, de temps en temps, un amiral pour encourager les autres."—By whom said, of what admiral?
2. Tennyson ("Life") says: "I never put two 'ss' together in any verse of mine."—Give instances to the contrary. What bearing has the *dictum* on a disputed reading in Gray?
3. "I have militated in former times, not without glory; but I grow peaceable as I grow old."—Identify the quotation and the allusions.
4. Do you know what a *splacknuck* is?
5. "Nous avons quarante oies qui gardent le Capitole."—Who are the geese, and what is the Capitol?
6. "Some gentleman missed his snuff-box, and Hook said [the Freemasons' Tavern was kept in those days, you must remember, by Mr. Cuff, not by its present proprietors]—well, the box being lost and asked for, Hook opened his silent jaws and said: '... Shall I tell you what he said? It was not a very good pun that the great punster then made.'—Suggest the pun.
7. Name references in poetry to balloons.
8. "Wisdom and Wit are little seen,
And Folly at full length."

—Name the three persons.

ANSWERS TO LITERARY PUZZLES.

1. Said by English public of Admiral Byng. See Voltaire, "Candide," chapter xxiii.
2. Some hundred instances in all have been given of violations by Tennyson of his canon. Most to the point are those where in later editions he has "driven out the hissing geese." "In such great offices as suit" changed to "those . . . that." "When all the trees stand in a mist of green" changed to "the wood stands." "We will eat the Lotos, sweet As the yellow honeycomb," of the 1833 edition. No one has quoted a fine line from "Queen Mary," "Hurls his soiled life

against the pikes and dies." The true reading in Gray's "Elegy" is "The lowing herd wind slowly o'er the lea."

3. From Thackeray's "Roundabout Papers." The allusions are to Horace, "Militavi non sine gloria," and "Lenit albescens animos capillus."

4. Question asked by Tennyson in letter to Edward Lushington. A *splacknuck* (or *splacknuck*) is an animal in Brobdingnag, very finely shaped, about six feet long. In the Norfolk dialect it means a miser, and, possibly, Tennyson may refer to this.

5. From Diderot. The geese are the forty members of the Académie, and the Capitol is the purity of the French language.

6. "Ask mine host. He takes every snuff-box for a Cuff-box." That's bad enough.

7. Opening stanzas of "A Dream of Fair Women": "As when a man that sails in a balloon," &c., suppressed. The fire-balloon in Prologue to "The Princess." Cowper in "The Task" refers to Montgolfier's invention, and Monti has an ode on him. See also Wordsworth, "The Blind Highland Boy" and "Peter Bell"; Campbell, "The Dead Eagle."

8. Picture of Beau Nash between Pope and Newton.

We classify the 85 versions received as follows:—

FRENCH.

First Class.—Viator, Welcome, Bonne Aventure.

Second Class.—Zoro, Penn, Bretagne, Crutty, C.E.M., H.A.K., Béra, A.Z., F.R.R.

Third Class.—Halton, E.A., Ba, Sirach, Grog, M.M.D., *ιδιάρης*, Yellow-Hawk, Booboo, H.J.M., Edgehill, Kerry, Aerolite, O.W., Kingston, Boniface, Neddingham.

Fourth Class.—Corklight, Cosy, Beta, Glyndon, Averil, Tête blanche, Patna, Yttaf, S. Clack, E.M.B., Pinson, Simon, Adèle, Agatha.

GERMAN.

First Class.—G. 2, Wanderer, Altes Haus, Teutwart.

Second Class.—Mica Orden, Cuckoo, Elma Burger, Deutschland, Dachs, Taugenichts, Mr. Dooley, H.L.D.

Third Class.—Agricola, G. A. Tann, Aerolite, Frida Ramsden, Mère Fossette, O.W.

Fourth Class.—Orange, F.S., Undine, Gast, Wilhelm, Vogel.

The entries for Literary Puzzles were disappointing. Marks out of 20 maximum are as follows:—G.E.D., 14; Chemineau, 10; Rolobo, Outis, Ayah, Nephest, 9; Smilax, Cara, Nash, Salve, At spes non fracta, Anna Seccotina, Sebastian, Valentia, 8; L.M.L., A.R.A., Casual, Fides, 7; Jaculum, Cor, Erin, Ch. Coll., Hailey, Froude, 6; F. S. Owens, Paris, B.B., Formosa, Klado, Hotspur, 5; Orient, B.O., Fulva, Speckles, U.S., Simia, Palinurus, 4; Nostis, Silvio, Polly, 3.

Whoe'er has travelled life's dull round,
Where'er his stages may have been,
May sigh to think he still has found
The warmest welcome at an inn.

The translations in French were the most numerous and the least satisfactory. Few observed the ordinary rules of French prosody—alternate masculine and feminine rimes, caesura, &c. *Stages* was made to rhyme with *voyage*; *tournée* and *vie* were placed before a consonant in the middle of a line. German lent itself best, and the best versions were in German. The Latin renderings were generally correct, but rarely idiomatic or pointed. We print a selection.

Quiconque de la vie a fait la triste ronde,
N'importe où le destin l'a jeté sous le ciel,
Doit pousser un soupir en pensant qu'en ce monde
Il a trouvé partout bon accueil—à l'hôtel.

WELCOME.

Quiconque a parcouru ce voyage ennuiant
Qui s'appelle la vie, ou remuant ou triste,
Peut à la fin se dire hélas! en soupirant,
L'accueil le plus sincère on doit à l'aubergiste.

MIHI SIT PROPOSITUM.

Quand tous les stades sont faits,
Le long de la vie,
Que, de relais en relais,
La route est finie,
Demandez au voyageur
Où l'accueil fut le meilleur :
—"A l'hôtellerie, ô gué !
A l'hôtellerie !"

BONNE AVENTURE.

Quisquis es expertus provectae taedia vitae,
Seu fuerit felix semita sive gravis,
"Vae mihi!" clamabis, "nil non venale; taberna
Inveni nusquam dulcius hospitium."

COPA.

Per tritum vitae quicunque meaverit orbem;
Ad quascunque domos verterit hospes iter;
"Hospitio"—gemet ille sibi—"caupona benigno
Publica privatum vicit ubique Larem."

C. H. St. L. R.

Wer viel im Leben ist herumgekommen,
Gesteht wohl seufzend, dass in jedem Land,
Wo er gewillt, das herzlichste Willkommen
Er immer doch in einem Wirthshaus fand!

TEUTWART.

Mr. Edward Latham sends us the following interesting note on the "Portrait of M. Diderot":—

"Pour savoir le nom de l'opéra-comique auquel fait allusion M. Diderot, j'ai eu recours à la bonté de M. Maurice Tourneux, de Paris, et il a bien voulu me fournir les indications précises qui m'ont mis à même de tirer l'affaire au clair. C'est M. Tourneux qui a publié 'La Correspondance Littéraire,' etc., de Grimm, Diderot, etc. (Garnier frères, 1877-82); donc je n'ai pu mieux faire que de m'adresser à lui pour ce renseignement. Voici un extrait de cet ouvrage (tom. IV, pp. 457, 458) qui aura, je n'en doute pas, quelque intérêt pour les lecteurs de votre *Journal*:"

"Une des plus jolies pièces de ce genre, c'est 'Le Jardinier et son Seigneur,' tirée de la fable de La Fontaine, que tout le monde connaît [liv. IV, 4]. Cette pièce vient de paraître [1761]. . . . La musique en est de M. Philidor, plus célèbre dans le jeu des échecs que par ses ouvrages de musique. . . . L'auteur a non-seulement rempli le but moral de la fable de La Fontaine, qui vous apprend qu'il vaut mieux

FLORIGENE

(NEW REGD. TRADE MARK)

AWARDED

THE ROYAL SANITARY INSTITUTE

BRONZE MEDAL,

SCHOOL HYGIENE EXHIBITION,
1905.

THE "DUST-ALLAYER" CO.,

Contractors to H.M. The Lords of the Admiralty; H.M. Office of Works, &c.

SHOULD BE APPLIED DURING THE
HOLIDAYS IF POSSIBLE.

"FLORIGENE" is an odourless fluid for Floors now being used for the Hygienic and Economic treatment of all kinds of Wood, Linoleum, Cork Matting, Mosaic Tile, and other Paving in

COLLEGES, LABORATORIES, AND SCHOOLS;
also Government and Municipal Buildings, Art Galleries, Factories, Libraries, Offices, Museums, Warehouses, &c.

"FLORIGENE" absorbs and fixes all dust or dirt as it comes in contact with the floor and purifies the atmosphere. It is a labour-saver and floor-preserver, and can easily and quickly be applied.

No scrubbing or damping is necessary, only the occasional sweeping with a hard broom, when the dust or dirt, which is held, will roll in front, and not be re-distributed.

Books, Furniture, Fixtures, and other contents of a room seldom require dusting or cleaning, as dust and dirt never rise from the floor after treatment.

"FLORIGENE" is effective for 2 to 4 months, according to the wear.

Further particulars, copies of Reports and Testimonials, may be obtained from—

165 QUEEN VICTORIA STREET, LONDON, E.C.

These School and Teachers' Advertisements are continued from page 316.

RESEARCHES.—Literary expert undertakes work in London (British Museum, &c.) and Paris (Bibliothèque Nationale, &c.) for Authors and Publishers. Terms moderate. DRILLING, GAMES, AND GYMNASIICS.

MISS MARGARET CAMPBELL,
Diplômée Member of the British College of Physical Education, Visits Schools and Clubs. Lessons given at private houses. Maypole Dancing a speciality. For terms apply to 84 Steinhold Avenue, Streatham Hill, S.W.

MISS GERTRUDE BAR-
RINGER (Contralto) visits Schools and receives Private Pupils for Voice Production, Solo and Class Singing, and Lessons in Accompanying. Experienced in organizing School Concerts. Very successful in preparing for Examinations.—107 St. George's Road, S.W.

ELOCUTION.—Miss JOSCELYNE
(Pupil of Miss ELSIE FOGERTY) teaches Reading aloud, Recitation, Voice Production, and Breathing. Special attention given to physical needs and development. Lectures and conducts School Classes. Visits Brighton Thursdays. Excellent testimonials. Terms, moderate, on application to 42 Undercliff Road, Lewisham, S.E.

PLAIN NEEDLEWORK AND
CUTTING OUT.—Experienced MISTRESS can visit one or two more Schools. Prepares large or small Classes for the Examinations of the London Institute.

Pupils have obtained "Excellent." No failures in 1904.

Lessons also given in Cane Weaving.—The Limes, Cheam Hill, Worcester Park, Surrey.

VOICE CULTURE.

Voices Produced, Trained, and Restored for Singing, Elocution, and Public Speaking.

New method. Exceptional results. Breathing difficulties overcome. Lectures.—Miss E. RUSHTON, A.R.A.M., 9 Mount Nod Road, Streatham.

A WELL known experienced
TEACHER OF FRENCH and GERMAN has some time disengaged for Visiting Engagements and Private Tuition at his own or at the Pupil's residence. Address—No. 6, 693.*

PARISIENNE.—Brevet Supérieur.
B.A. London (First Class Honours). Registered. Many years' experience in well known High School. Has some time disengaged for School or Private Coaching. Address—No. 6, 694.*

COACHING OR VISITING

LESSONS.—Lady (experienced Teacher, Cambridge Higher Local First Class Honours) requires additional Lessons. English Language and Literature, advanced Latin, French, Italian, Correspondence. Excellent references.—M. P., 7 Fawcett Street, Redcliffe Gardens, S.W.

MISS WINIFRED MEAKIN, of
the Guildhall School of Music (Pupil of Mr. Cairns James, late Resident Mistress of Elocution at Havergal College, Toronto, Cambridge Teachers' Certificate, Registered Column B), is prepared to Visit Schools in London and neighbourhood for Elocution and Voice Production. Special attention is given to improving Canadian and American accents. Elocution Engagements accepted. Address—ELOCUTION, The Limes, Cheam Hill, Worcester Park.

HAT BANDS, CAPS, AND BADGES

At Wholesale Prices
through Manufacturer's Agent.

Quotations for any Quantity, Design, or Colour. Write—SCHOOLS AGENT, 1 Arundel Villas, Chelmsford Road, South Woodford, N.E.

SALE OR TRANSFER.

SCHOOL TRANSFERS AND

PARTNERSHIPS.—Ladies and Gentlemen wishing to be notified of particulars of **Schools for Sale or Partnerships in Schools** of any denomination should send a detailed statement of their requirements to Mr. TRUMAN, 6 Holles Street, Cavendish Square, London, W., who acts as Agent to many of the best establishments.

All applications and inquiries are treated as strictly private and confidential. **No charge is made to purchasers.**

SMALL Nucleus of Recognized
GIRLS' SCHOOL to be transferred at capitulation fees. Fitted Gymnasium and school furniture to be sold. Airy detached house (on lease), with good garden, suitable for Principal wishing to move few Boarders into country, near London. Address—No. 6, 703.*

* Replies to these Advertisements should be addressed "No. —, The Journal of Education, 3 Broadway, Ludgate Hill, E.C." Each must contain a loose stamp to cover postage on to advertiser. Post Cards will NOT be sent on.

School and Teachers' Advertisements are continued on pages 355, 356, 357, 358, and 359.

souffrir un petit mal et prendre patience que d'y remédier par la protection des grands. Le seigneur, avec son train de valets et sa meute de chiens courants, fait dans un instant plus de mal aux potagers de maître Simon, jardinier, que le lièvre dont il vient de le délivrer n'en aurait fait dans vingt ans. Mais M. Sedaine a associé à cette moralité une autre idée bien plaisante et bien originale. Maître Simon est en habit de dimanche; rien ne lui manque que sa perruque. Il attend dans cette parure le seigneur avec une vanité et une fatuité qui insultent à tout le village. Au moment qu'on lui apporte sa perruque, sa femme, plus sensée que lui et moins engouée de arrivée de monseigneur, le met en colère. Voilà la perruque qui tombe par terre et maître Simon qui marche dessus, et le perruquier de la reprendre pour l'accommoder de nouveau. Or, de toute la pièce, maître Simon ne peut plus joindre sa perruque. Monseigneur arrive, ne prend pas trop de garde au maître jardinier, caresse sa fille, parle à tout le monde, excepté au bonhomme Simon. Celui-ci attribue tous ses malheurs à ce qu'il n'a pas sa perruque. "Il ne m'a," dit-il, "jamais vu sans perruque. . . il est piqué de me voir sans perruque." Enfin personne ne sort que maître Simon ne lui recommande de lui envoyer sa perruque; et le seigneur met le comble à sa douleur en disant à la fin, sans l'avoir salué: "Ah! vous voilà, mettez votre bonnet, bonhomme." . . . On en rit d'abord comme d'une saillie naturelle et plaisante, et, lorsqu'on est arrivé à la fin de la pièce, on s'aperçoit qu'elle roule tout entière sur cette perruque; car maître Simon la retrouve précisément au moment que le seigneur est parti, c'est-à-dire, lorsqu'il n'en a plus besoin. Combien de gens qui, dans toute leur vie, n'ont pu joindre leur perruque!

"M. Tourneux me dit, à propos de la main gauche 'qui n'est pas dessinée':

"Autant qu'il m'en souvient, la main gauche du modèle laisse en effet à désirer comme *dessin*, c'est-à-dire, par la façon dont le peintre en a tracé le contour et rendu la couleur, et ce défaut avait frappé Diderot et ses amis. Le graveur (j'avais pris la peine d'aller voir au Musée britannique une gravure du portrait original, mais là les deux mains sont tout aussi bien gravées l'une que l'autre) a très probablement corrigé ce défaut et, lorsqu'on n'a pas eu l'original sous les yeux, on peut en effet trouver cette remarque peu intelligible."

A Prize of Two Guineas is offered for the translation of the following ballad of Seidl:—

Horch, Marthe, draussen pocht es; geh, lass den Mann herein,
Es wird ein armer Pilger, der sich verirrt, sein!—
"Grüss Gott, du schmucker Krieger! nimm Platz an unserm Tisch;
Das Brod ist weiss und locker, der Trank ist hell und frisch!"

"Es ist nicht Trank, noch Speise, wonach es Noth mir thut,
Doch, so ihr seid Hans Euler, so will ich euer Blut!
Wisst ihr, vor Monden hab' ich euch noch als Feind bedroht:
Dort hatt' ich einen Bruder, den Bruder schlugt ihr todt.

Und als er rang am Boden, da schwur ich es ihm gleich,
Dass ich ihn rächen wollte, früh oder spät, an euch!"—
"Und hab' ich ihn erschlagen, so war's im rechten Streit,
Und kommt ihr, ihn zu rächen—wohlan, ich bin bereit!"

Doch nicht im Hause kämpf' ich, nicht zwischen Thür und Wand:
Im Angesichte dessen, wofür ich stritt und stand.
Den Säbel—Marthe, weinst du?—womit ich ihn erschlug,
Und sollt' ich nimmer kommen—Tyrol ist gross genug!"

Sie gehen mit einander den nahen Fels hinan;
Sein gülden Thor hat eben der Morgen aufgethan;—
Der Hans voran, der Fremde recht rüstig hinterdrein,
Und höher steht mit Beiden der liebe Sonnenschein.

Nun stehn sie an der Spitze,—da liegt die Alpenwelt,
Die wunderbare, grosse, vor ihnen aufgehellt;
Gesunk'ne Nebel zeigen der Thäler reiche Lust,
Mit Hütten in den Armen, die Heerden an der Brust.

Dazwischen Riesenbäche, darunter Kluft an Kluft,
Daneben Wälderkrone, darüber freie Luft;
Und sichtbar nicht, doch fühlbar, von Gottes Ruh' umkreist,
In Hütten und in Herzen der alten Treue Geist.

Das sehn die Beiden droben, dem Fremden sinkt die Hand,
Hans aber zeigt hinunter auf's liebe Vaterland:
"Für das hab' ich gekochten, dein Bruder hat's bedroht;
Für das hab' ich gestritten, für das schlug ich ihn todt."

Der Fremde sieht hinunter, sieht Hansen in's Gesicht,
Er will den Arm erheben, den Arm erhebt er nicht:
"Und hast du ihn erschlagen, so war's im rechten Streit,
Und willst du mir verzeihen, komm, Hans, ich bin bereit!"

MISSING RIMES.

An Extra Prize of One Guinea for the following competition. In case of equality the prize will be adjudged

to the candidate who correctly fills in the blanks and also identifies the quotation:—

1. And yet, as angels in some brighter dreams
Call to the soul when man doth sleep,
So some strange thoughts transcend our wonted —
And into glory —.
2. Sound, sound the clarion, fill the —;
To all the sensual world —:
One crowded hour of glorious life
Is worth an age without a name.
3. Cruel, but composed and bland,
Dumb, inscrutable, and —,
So Tiberius might have sat,
Had Tiberius been —.
4. True histories of last year's ghost,
Lines to a ringlet or a turban,
And trifles for the —,
And nothings for Sylvanus —.
5. Art thou a Statist in the —
Of public conflicts trained and —?
First learn to love one living man;
Then may'st thou think upon the dead.
6. Yon bird is strong to fly:
How straight the balanced pinions —!
Twin scimitars, that carve the cloudy group,
Or, rigid as a —,
Print their sad cypher on the polished sky.
7. Where all desires are dead or cold
As is the —.
8. No graven images may be
Worshipped except the —.
9. Yet thy true lovers more admire by far
Thy naked beauties; give me a —.
10. Then gently scan your brother man,
Still gentler sister woman:
Though they may gang a kennin' —,
To step aside is —.

Initials or a nom de guerre must be adopted by ALL competitors, but the prize-winners will be required to send real names for publication.

Those in the First Class are entitled on application to a copy of "Essays in Translation."

All competitions must reach the Office by May 16th, addressed "Prize Editor," THE JOURNAL OF EDUCATION, 3 Broadway, Ludgate Hill, E.C.

ADVANCED HISTORICAL TEACHING COMMITTEE.—In our March number we suggested that the work of this Committee should be carried out in connexion with the University of London. Our readers may be glad to have some particulars of the work it has been doing since 1902. Courses of lectures have been delivered in the London School of Economics by Mr. Hubert Hall, of the Record Office, and by Mr. J. S. Leadam. Mr. Hall's course for Michaelmas Term, 1904, was upon select documents illustrating the internal history of the British Islands and the English possessions in France between 800 and 1450 A.D. It is to be followed in Lent Term, 1905, by a course on the external relations of England during the Middle Ages. Mr. Leadam's course for these two terms is upon early Tudor history from original sources, and deals especially with guilds and matters of trade or commerce. Both courses have been well attended by graduates engaged in educational work or studying with a view to the doctorate. The main object of the lectures is to give students the instruction necessary to enable them to make use of the wealth of documentary material which is so abundant in London, and to select the proper authorities for particular subjects. Opportunities are afforded them of personally examining the chief printed editions, facsimiles, or original MSS. referred to, at the British Museum or the Record Office. The new Regius Professor of Modern History at Oxford made the training of historians the subject of his inaugural lecture; the Advanced Historical Teaching Committee may claim that the first practical steps, though on a modest scale, have been taken in London. But it is not a matter which concerns only would-be historians or medievalists. People who are studying law, economics, or military science may find themselves on a line of inquiry which leads them back to the Middle Ages, but dare not follow it up for want of a grammar and a chart.

JUST PUBLISHED. vi+264 pp. Crown 8vo, 6s.

"A careful study of these lessons, and, indeed, of the whole book, can be confidently recommended to all who are engaged in the duty of teaching, either in primary or in secondary schools, and only good could ensue were members of Education Committees and managers of schools to make a careful study of Mr. Winch's notes and conclusions."—*EDUCATION*.

"These outline lessons are curiously interesting, at least to all who have a practical acquaintance with the subject."—*SPECTATOR*.

"Any one taking up this book and expecting to find the usual criticism and information will be entirely disappointed; for Mr. Winch has made his volume useful and interesting from cover to cover. If he could be deputed to give us a book on French or a book on English schools, written exactly on the same lines, many people would be grateful."—*EDUCATIONAL RECORD*.

Notes on German Schools.

With special relation to Curriculum and Methods of Teaching.

BY

WILLIAM H. WINCH, M.A.,

Late Scholar of St. John's College, Cambridge; Inspector of Schools; Author of "Problems in Education."

Mr. Winch has travelled over Germany, observing the educational system in a large number of schools, and he has given the results of his investigations in these Notes to serve as data for comparison between the German and the English systems.

His attention, as he says, was "mainly confined to the primary, middle, and that section of secondary schools in which modern languages and science take a prominent place." The principal points taken up are the school hours, training and salaries of teachers, curricula and methods of teaching, and the examination and promotion of the children. It is noted that the average school curriculum is much simpler than in England, that more time is devoted to the study of the mother tongue and literature, and that, except in the Hamburg boys' schools, foreign languages are not included in the primary-school curriculum. The individual teacher has no difficulty about the fair allotment of time to each subject, as that is settled for him in the official Syllabus of Instruction, which is perfectly rigid.

Mr. Winch points out further that in the direction of schools there is now in England, under the new Education Act, an interesting approximation to the German system. Directly-elected School Boards are unknown in Germany, the Schools being under the charge of the municipalities. The second part of the book is devoted to outline lessons in the various subjects of the curriculum which Mr. Winch has heard taught.

SOME RECENT EDUCATIONAL REFORMERS.

I.—PROF. H. E. ARMSTRONG.

By Dr. F. H. HAYWARD.

THE late Dr. Salmon, equally eminent as theologian and as mathematician, remarks in his well known "Introduction to the New Testament": "The labour of forming opinions for themselves is too much for most men and for almost all women. They look out for some authority from whom they can take opinions ready made."

Matthew Arnold, in his essay on Shelley, tells the following story. Mrs. Shelley, choosing a school for her son, asked the advice of a lady, who thereupon gave utterance to "just the sort of banality one does come out with: 'Oh, send him somewhere where they will teach him to think for himself.'" "I have had," continues Arnold, "far too long a training as a school-inspector to presume to call an utterance of this kind a 'banality'; however, it is not on this advice that I now wish to lay stress, but upon Mrs. Shelley's reply to it. Mrs. Shelley answered: 'Teach him to think for himself! Oh, my God! teach him rather to think like other people.'"

Another of the contradictions which baffle us modern educators! On the one hand, the advice—for that is, perhaps, what Dr. Salmon's words amount to—that we should encourage the adoption of a "heuristic" attitude of mind, a spirit of inquisitiveness and independence, of taking little or nothing on trust, of "thinking for ourselves"; on the other hand, a recognition of the perils of laying too much stress upon this principle. Neither Dr. Salmon nor Mrs. Shelley was an "educationist" by profession; yet the conflict of opinion which their words shadow forth is one that exists at this moment, and one that shows no sign of abatement, in the ranks of teachers and educational writers.

Hegel has laid stress upon the synthesis of contradictories. Is synthesis possible here? For the moment there is no doubt that the former of the "two voices" is the louder. The average "educational reformer" has various arrows in his quiver, but his favourite one is the demand that the pupils in our schools should be taught to "think for themselves." The advice comes forth almost automatically at prize distributions and school openings. Yet here is Mrs. Shelley recoiling with something like horror from prescribing such a treatment for her son!

The truth is, and this will become more obvious as we study with increasing care the educational needs of the time, that "to think for oneself" is a valuable and indispensable endowment of a complete man, and therefore one that we should encourage among our pupils, especially at certain stages of development; but it is *not* the only educational need, nor is it perhaps the most pressing. When a medical man is called upon to prescribe for an overfed and under-exercised patient he naturally prescribes walking or cycling or dumbbell exercises. When he is called upon to prescribe for a starving street urchin, who toils from sundown to midnight at selling football editions, he naturally prescribes more food and less toil. So with our educationists. When they see the mind surfeited with excess of memory material almost passively received and not more than half digested, they rightly urge the further necessity of a more mentally aggressive attitude; they become advocates of "heuristic" methods; when, on the other hand, they find a mind starving on purely formal subjects—on English or Latin grammar, on arithmetic, on reading viewed as a mere dexterity—a mind, therefore, without living interests and apperceptive power, they urge or should urge with equal emphasis the necessity for a mental diet more nutritive and stimulating. The former is the attitude of Dr. Armstrong. A few quotations,* though they are almost superfluous, will establish this fact.

"Much of the mental inertness of the day is acquired at school by over-indulgence in book study" (page 69). "We all know how easily we forget most things which are told to us or which we read about" (page 194). "In fact, mere knowledge counts for very little, *nous* for everything" (page 400). "I would urge you not to attempt too much, but to remember always that you are seeking to form habits, and not to impart

* I quote from his collected papers, "The Teaching of Scientific Method." (Macmillan, 1903.)

mere knowledge" (page 403). Dr. Armstrong similarly quotes with the warmest approval the declaration of Edward Thring that we should "break down the knowledge idol," "smash up the idolatry of knowledge," and "frankly admit that the majority of mankind cannot get much knowledge." He protests against the predominance of Chinese literary methods and ideals (page 13), and quotes with approval the act of the Oriental emperor who, in disgust at those methods and ideals, caused the burning of books (page 11). One is here reminded of some of Rousseau's wildest onslaughts.

Expressions like certain of those quoted are rapidly becoming the educational orthodoxy of reformers. The desire to spread "information" among the "lower" or other classes is ceasing to operate powerfully; information, facts, knowledge, charm our educational leaders no longer, though in our schools we are still influenced in certain of our subjects by the old formula.

What is Dr. Armstrong's remedy? Our teaching, he tells us, must, in the first place, be so directed as to stimulate "doing" rather than "knowing"; manual work, though not necessarily on the lines now adopted, should occupy a far more prominent place than hitherto in the curriculum. "Boys and girls generally must not be confined to desk studies" (page 8). "Classrooms must either be converted into workshops, or ample workshop accommodation must be provided" (page 20). But it is not as a champion of manual instruction *per se* that Dr. Armstrong has any claims upon our attention. It is rather as an advocate of experimental work carried out with a view of encouraging a spirit of inquiry or investigation; our pupils have to adopt a "heuristic" attitude, primarily in their "science" work, but, also, to a large extent, in their literary studies also. That this is the central principle of Dr. Armstrong's teaching is well known, but a few quotations will not be out of place.

"Problems must be set, and time must be allowed for their solution" (page 20). "Regard the instruction entirely* from the disciplinary point of view" while basing it on utilitarian considerations (page 193). The endeavour should be made "to inculcate the habits of observing accurately, of experimenting exactly, of observing and experimenting with a clearly defined and logical purpose, and of logical reasoning from observation and the results of experimental inquiry. Scientific habits and method must be universally taught" (page 8). "The so-called science taught in most schools, especially that which is demanded by examiners, is not only worthless, but positively detrimental" (page 17), as it is not taught along "heuristic" lines. Evidently Prof. Armstrong's views are closely akin, in certain of their aspects, to those of Froebel.

It has sometimes been supposed that the chief feature of the "heuristic method," or the "method of discovery," is its insistence upon the child's repeating the discoveries of past ages, recapitulating, in miniature, the scientific history of the race, including, as a special case, the primitive stage, when man was inventing tools, &c., for himself and discovering the facts of nature. I cannot find that Prof. Armstrong lays much stress upon this principle, to which, indeed, many obstacles and objections present themselves. Born amid, and already familiarized with, modern conditions, the child who attends our schools cannot be transplanted wholly into preceding centuries, though in its earlier years there may undoubtedly exist a certain innate sympathy between the mental and moral attitude of the child and that of the primitive man, a sympathy of which Ziller, in his doctrine of "culture stages," has availed himself.† The doctrine of the parallelism between racial and individual development, strikingly borne out by embryological discoveries, is suggestive but not conclusive to educational reformers. It gives *prima facie* cases for consideration, but these cases have each to be critically considered. Prof. Armstrong does not rely upon analogies of this kind, but rather upon the undoubted fact that man must be *efficient*, and that efficiency is therefore one of the ends, though perhaps only a subordinate one, which the teacher must put before himself.

By adopting the methods that have been briefly indicated, Dr. Armstrong believes that we may bring school into close touch with general life. Man, he tells us, has, in the long run, to grapple with practical problems, not to receive passively the ideas of his fellows. Foreign competition is facing us (page 402);

how important, then, that an attitude of open-minded, strenuous effort should be encouraged, rather than frowned upon, during the school days of the pupil! "The work done in school is, at present, impossible to translate into ordinary practice, is foreign to outside requirements" (page 83). Our schools "hinder the development of practical ability" (page 83). "To be scientific is to be knowing or canny, in the best and highest and fullest sense of the term; the knowing man being one who *can*, who has the power of doing, of producing as well as of holding" (page 196). There is a general lack of "initiative" in our public departments (page 72), and this is traceable in large measure to our schools and Universities, at which only one industry flourishes—"the examination industry" (page 108). The weakness cannot be remedied by the premature encouragement of "technical teaching"; it is not the province of schools to teach any branch of science technically or even specifically; what is really needed is "training in scientific method" (page 453).

Below will be found indications of what I regard as the chief weakness in Prof. Armstrong's propaganda. I do not believe—nor does our writer always believe—that "knowledge," or "mere knowledge," is so unimportant as some of his expressions would suggest. Above all, I do not believe that to encourage the study of Nature, to the neglect of the study of man by means of history, literature, fairy-tale, Bible, and the like, would be anything but a fearfully retrograde step; though the young child (as Wordsworth points out) and the adolescent (as Dr. Stanley Hall points out) often see a fascination in "Nature." Prof. Armstrong is right in his positive suggestions; wrong in his emphasis.

Just for the present, however, I wish to adduce a few of the objections that have been brought forward against the "heuristic" method itself. Mr. H. G. Wells, who, on many matters, stands close to our writer, holds that, however excellent in the hands of Prof. Armstrong himself, and able teachers, the method would be nothing but a "pointless fumble" in the hands of most teachers.* In his "Food of the Gods" he propounds "an improvement on Prof. Armstrong's 'heuristic' method, whereby, at the cost of three or four hundred pounds' worth of apparatus, a total neglect of all other studies, and the individual attention of a teacher of exceptional gifts, an average child might, with a peculiar sort of thumby thoroughness, learn in the course of ten or twelve years almost as much chemistry as one could get in one of those objectionable shilling text-books." So long as dangers like this face us, there is every reason for moving cautiously.

Germany, at any rate, has no sympathy with "heuristic methods" in the school. "The German teacher relies upon the lecture rather than upon the laboratory method. . . . It is better for the pupil to see experiments properly executed, and to be trained to observe and reason correctly by his teacher, than to grope helplessly along in the dark, endeavouring to discover for himself. Life is too short for inventive methods . . . the accumulated knowledge and experience of the race is the child's, to assimilate and make his own as rapidly as may be."† I incline to think that Prof. Armstrong is nearer the truth than German teachers, if the above account correctly represents the attitude of the latter; still, we see that "lecture methods" may, after all, have a place of their own; and I believe that in scientific Germany the laboratory is almost unknown except for scholars beyond the ordinary school age. The Germans, in fact, have little sympathy with Froebel and his modern followers. Probably the Germans are wrong in this; but it is equally probably that Prof. Armstrong's neglect of Herbart is as fatal a mistake as their neglect of Froebel.

The objection brought against "heuristic" proposals, that there is no need for the modern child to reproduce the errors and "backward-sweeping curves" of racial evolution, and that he should rather be led in a straight course to the desired goal, is an objection that is scarcely applicable to Prof. Armstrong's own proposals. As already indicated, he lays no great stress upon the doctrine of parallelism. But I question whether he gives due weight to the educational value of imitation, a feature of racial and individual development quite as important as initiative.‡ It is also very doubtful whether such "heuristic"

* This "entirely" is dangerous.

† Consider especially the "fairy tale" and "Robinson Crusoe" proposals.

* "Mankind in the Making," page 183.

† Hughes, "The Making of Citizens," page 253.

‡ Prof. Lloyd Morgan has mentioned this point.

inductions as are possible in school are not logically defective.

Some expressions in Dr. Armstrong's papers go to show that his condemnation of the "knowledge" ideal is by no means absolute; he sees the dangers of "ignorance" (page 402); he sees a value in knowledge, ideas, information, irrespective, apparently, of the mode—"heuristic" or other—in which these are obtained. His hard words about bookish knowledge give place to a frank recognition that such knowledge is indispensable. "Books are wanted, written in a bright, attractive, and simple style, full of accurate information, which would carry us over the world and give clear pictures of all that is to be seen, as well as of the character and customs of its inhabitants; and books are wanted which, in like manner, would carry us back in time and sketch the history of the peoples of the Earth. The various branches of science all need their popular exponents" (pages 86-87). "Children must not only be taught to read books: they must learn also to regard and use them as sources of information; the habit of flying for information to books must be cultivated" (page 85). Heuristic methods, in short, are as applicable to literary as to other subjects. It is not easy to reconcile these pronouncements with some that precede, but, so far as I can see, Prof. Armstrong's point is that most school-books are of the "text-book" variety; books which, though full of information, are devoid of intrinsic merits, incapable of arousing genuine interest, defective in method; books that are not seminal and thus fail to suggest lines of discovery, or, when such lines have been suggested, fail to provide the "minute details" (page 87) that may be required for carrying out the discovery. But on the whole Prof. Armstrong's references to books seem to me hesitating and confused, almost contradictory. The general attitude he adopts is one of depreciating "mere knowledge," especially book knowledge; yet he tells us that "we do not sufficiently recognize the value of books as stores of information and savers of brain waste" (page 87). In other words, knowledge is valuable after all, but (apparently) not when stored in the mind; men have to be sufficiently acute and "knowing" to be able to fly to books for such facts as may be required on occasion, but must not attempt to retain these facts in their memory.* To me, at any rate, this principle, when pressed to an extreme, seems quite as dangerous as the policy of heaping up in the memory a mass of verbal or other knowledge; the mind that Dr. Armstrong would create would be a hard, conscienceless, insensitive, unlovely mind, fitter to inhabit those remorseless mental horrors with which Mr. Wells peoples the planet Marst than the erring men of this world—men who need the ever-present stimulus of ideals and the vision of high reality.

I do not say that by following the tendency of Prof. Armstrong's thought we should be seriously led astray; finding ourselves amid dangers, we should soon come to a pause: but I do say that his thought would land us in these dangers, if we pursued it with rigid consistency. I agree that we should use books for purposes of minute reference; I agree that we should encourage such use; I agree that there is no need to burden the memory with petty details; but I do not agree, and I regard it as an educational heresy of the first dimensions, that we ought to depreciate the possession by the mind of rich and varied knowledge. Prof. Armstrong quotes, with approval, Thring's words: "Create great interest." The Herbartians will tell him that, on a purely "heuristic" basis—a basis of starving the mind of all knowledge, except such as is acquired by personal original effort—interest cannot be "created," for it depends upon apperception, and, therefore, on the possession of previous knowledge. Prof. Armstrong laments the lack of interest that prevails at the present day; "our children have no healthy desire to increase their intelligence" (page 15). Possibly the reason for this is quite different from the reason he adduces. Instead of there being a surfeit of knowledge, there may be too little knowledge; the curriculum may have been too "formal." Sir Oliver Lodge thinks that this holds good of at least some schools.† Curiously enough, also, the very case that Prof. Armstrong cites as bearing

out his contention is cited by a prominent Herbartian as a proof of the need of "mere knowledge"—the case of Sherlock Holmes. The power of "putting two and two together," possessed by that famous detective, wins his approval (page 16); but Prof. Adams draws quite another educational inference from the facts. "Holmes's apperception mass contained the German word *Rache*, which means 'revenge.' Holmes was right; Lestrade was wrong. But it was not a matter of reasoning backwards or forwards; it was a matter of knowledge."‡ Much of the lack of interest and general inefficiency which Prof. Armstrong deplores is due to the absence of that "knowledge" which he would sometimes have us to despise. He is trapped, as most non-Herbartians seem fated to be trapped, in the coils of the "faculty doctrine." There is no "mere knowledge," as Herbart or Prof. James would tell him; nay, he might have learnt the same from his leader Spencer. "Knowledge is turned into faculty as soon as it is taken in."

Perhaps the greatest danger to education at this moment—except the ever imminent danger of increased officialism—is the stress laid by reformers like Prof. Armstrong and Mr. Wells on instrumental subjects. Is it not clear that the possession of "power," of a heuristically active mind, and the like, is no guarantee that the character is in a healthy state? Instrumental subjects are but means to an end, and will serve the end of a bad man as well as that of a good man. They are "knife and fork studies," not "dinner studies," as Prof. Adams is constantly urging. Moral insight depends on ideas, not on powers; interest, too—closely related, as Herbartians assure us, with character—ultimately rests, in large measure, on ideas and their apperceptive reactions. Hence they regard the laying of stress on formal subjects and dexterities as a dangerous thing, a thing legitimate only on the assumption that we have too much neglected these subjects and dexterities.

I have no doubt that Prof. Armstrong would admit much of this. In fact, I find him conceding that mere automatic efficiency in the "three R's" is, *in itself*, a comparatively unimportant thing (page 6). But I would urge that *any* kind of efficiency—even scientific efficiency—is an unimportant thing *in itself*, unless our aim is to create a nation of soulless victors in a brutal struggle for existence. Such a struggle, he says in one place, is "Nature's first law" (page 38); but for education to allow its methods to be dominated by such a law seems to me the most fatal policy that can be adopted. That we have to exist if we are to be "virtuous" is true; that we have to eat food and live under shelter if we are to be moral and civil beings is also true; but such considerations do not justify us in adopting the "first law of Nature" as an educational guide.

As corollaries of his main proposition, we find Prof. Armstrong urging (1) the introduction of a "fourth R"—reasoning—among the "three R's" of our elementary schools (page 89), and (2) that "whatever we do, let us be thorough" (page 89).

This gospel of "thoroughness" was described by Edward Thring—whom Prof. Armstrong regards with great respect—as "a fallacy." "There is something so wise, so unanswerable, in the modest yet firm requirement that the lessons must be done thoroughly, and a boy not advance till he has mastered what he is doing, that the request commands assent at once; what is also so real a truth underlying the *dictum* that the fallacy involved in it easily escapes notice. The fallacy is—*it cannot be done*. There is no power in the minds of the young to master a subject thoroughly. Thorough mastery is the perfection of trained skill, and it is absurd to demand the perfection of trained skill from the untrained beginner. . . . There must be change. . . . Monotony is the greatest enemy a teacher has to deal with."‡ My impression is that Prof. Armstrong is thinking rather of exactness than thoroughness; but, at any rate, it is clear that in the strict sense "thoroughness" is unattainable in, at any rate, all the "knowledge" departments of school work. No child can study even a lump of granite "thoroughly"—to do so would involve a very considerable knowledge of geology and chemistry; but the child can study the lump with considerable *exactness* (in other words, observe and describe it in much detail) if such an exercise is prescribed. "Thoroughness" in the study of the more imaginative subjects—those of the humanistic group—may easily do as much harm as good. To feed the mind, kindle the imagination, and

* Yet elsewhere he says, "there never was a time when general knowledge was of greater value than it is at the present day" (page 68). It is almost impossible, on this subject, to find out what Prof. Armstrong does mean.

awaken the idealizing instinct are important tasks, quite distinct from the task which Prof. Armstrong stresses.*

Again, when he—and, more recently, Sir W. Collins—prescribes a “fourth R” (Reasoning), the value of the suggestion, though considerable, is limited by the considerations already put forward. Reasoning is a good and great thing, and becomes of increasing importance as the age of the child advances; but for the child’s mind to be stored with noble ideas of a humanizing kind is quite as important, and certainly more primary.

Again, I do not imagine that Prof. Armstrong, if pressed, would deny this.† In his noble British Association address he said that “we need to send forth a new mission charged with the holy duty of enabling man to appreciate and acknowledge the beauty of the universe, as well as of preparing him to be a thoroughly effective worker, thus fitting him for the true, unselfish, and reverent enjoyment of life” (page 45). Here the distinction between character and mere instrumental efficiency is clearly indicated; and he stresses, like a genuine Herbartian, the importance of “creating in all minds a higher and reverent interest in life” (page 45) such as may be fruitful in moral consequences (page 53). But I do not see that the doctrine most commonly associated with Prof. Armstrong’s name—the “heuristic” doctrine—is one that bears closely on the ideal shadowed forth in the above words, for interest is largely a matter of apperception; and apperceptive power, if his proposals were pressed too far, would be seriously weakened or endangered. The strenuous sides of character on which Prof. Armstrong lays such stress are useless—they may be even pernicious—apart from the possession of a power (however subtle and vague) of idealization, of moral sensitiveness; a richness and freedom of imagination; a responsiveness; an elasticity. Many a boy—David Copperfield is an instance from fiction—has been saved by the reading of imaginative literature from being mentally and morally crushed; a “heuristic” method of training would never accomplish this, for such a method presupposes, or should presuppose, an already well fed mind. Prof. Armstrong sees in the laboratory balance “an extraordinarily potent means of effecting moral culture” (page 217). The language seems to me exaggerated. Exactness, accuracy, precision—all this is good, but it may appertain as well to a devil incarnate as to a moral being. The fundamental weakness of Prof. Armstrong’s position is this exaggerated stress upon purely instrumental subjects or methods; what he says is always worthy of attention and frequently of vast importance and suggestiveness, but it nearly always concerns matters which, though important for efficiency, would be as valuable in this respect to fiends and scoundrels as to angels and saints. Thinking power, initiative, independence, thoroughness—these do *not* constitute a perfect man. The need for “character-forming instruction,” “humanistic instruction”—the “*Gesinnungsunterricht*” of the Herbartians—he scarcely recognizes at all; the only precise instance of its recognition known to me in Prof. Armstrong’s book takes the form of a quotation from Thring (page 84). But perhaps when he is urging that “the art of reading should be cultivated,” and is hoping that “in the near future it will be a common sight in schools often to find the children all earnestly engaged in reading healthy books” (pages 202–3), it is to such imaginative and character-forming literature that he is referring. His complaint that “at present no school teaches reading” (page 203) sounds strange after his attacks on “book-study”; but the inconsistency may be removed by the admission that, while “Nature” cannot be learnt from books, “human nature”—the subject-matter of “humanistic instruction”—can.

But, though the limitations of Prof. Armstrong’s view must be admitted, the value of his more detailed suggestions must be recognized with equal frankness, especially when they concern the correlation of subjects. “At present there is neither a central subject nor a central motive ‡ in the course of training

given in our schools. The need of co-ordinating and correlating studies is scarcely thought of, each subject being taught separately, so that much time is wasted, and many opportunities are lost” (page 195). Prof. Armstrong scarcely recognizes the fact that many thinkers, notably the Herbartians and Froebelians, *are* working along these lines, though his remarks are substantially true so far as they concern England itself. He is right in urging that, for schools, chemistry and physics should be regarded as one subject (page 66); that it was a mistake to teach subjects in “watertight compartments,” mathematics, for example, being held distinct from physical measurements (page 454), and simple arithmetical calculations distinct from Nature study (page 432). Prof. Armstrong believes strongly in teaching many things *incidentally*, and there is no doubt that such a method has many advantages in the way of “interest”; but it is often a less “thorough” one than the other, and might, for that reason, have been expected to obtain Prof. Armstrong’s condemnation. But the ideal of “thoroughness,” as already indicated, is a fallacious ideal, whereas the suggestion that much teaching should be of an incidental character is extremely valuable, and would serve—as our writer points out (page 91)—substantially to relieve the present pressure on the curriculum. It is based partly on the principle that problems or tasks, involving concentrated effort are in themselves interesting and exhilarating, and that in their performance all pertinent matter and devices should be employed; partly on the fact that rigid lines of separation between subject and subject are artificial, and pernicious to the unity of the mind. A boy has some experimental problem before him: he is first to write out the plan proposed for its solution; then to proceed to fit up his apparatus, and, if carpenter’s or smith’s work enters into the task, he will “incidentally get a lesson or gain practice in such work” (page 21). Again, he asks, though here, I think, with somewhat less force: “Why should there be any set lessons in subjects such as history and geography? Why should not the method by which we get up a subject in later life be followed in schools?” (page 85). In other words, let us look up the geography of Japan when something suggests the necessity for this—when a problem, historical or other, has to be solved; let us use our books and our subjects as we use our tools. Composition, too, should be taught incidentally and “chiefly in connexion with the experimental work” (page 88), the child writing an account of the problem solved or to be solved. Similarly with drawing, a subject on which our writer lays much stress. It should be employed, for example, “to illustrate the account written of some outing” (pages 88, 201); in fact, “some of the seniors might even take photographs; in writing out the account, literary powers might be developed; grammar, spelling, and composition might all be taught incidentally” (page 201). Here, I conceive, Prof. Armstrong is on right lines; dexterities and formal subjects should not assume central places in the curriculum; they are but means to an end. True, Prof. Armstrong’s view of what *should* take the central place is a view to which many Herbartians, at least, would take exception; but this does not invalidate the hints just given. Similarly, “the conventional object lesson”* is “a model of what should be avoided” (page 199), being an artificial and isolated thing, in which the teacher does most of the work; its place should be taken by “object studies”—systematic efforts in the direction of collecting and weighing specimens, measuring buildings, and the like (page 430); “rigid time-tables in which every five minutes during the day has its allotted task must give way to a far more elastic plan” (page 218). Prof. Armstrong makes a suggestion that recalls Ziller’s proposal to teach mathematics, Nature study, and other subjects on to “fairy tales”; he sees value in using such a story as “The Three Giants” in the “Books for the Bairns” as a basis for the elementary study of water—an interesting application of the “concentration” principle.

Prof. Armstrong’s proposals with regard to science teaching—in other words, the proposals of the British Association—have for many years received a certain degree of recognition in modern schools. “Chemistry” is taught in a more quantitative and practical manner, and is itself preceded by lessons in practical measurements. As indicating, however, the uncertainty which surrounds all present-day problems of education, the recent declarations of an eminent American educationist deserve

* Elsewhere he deprecates premature “specialization” (page 68), and urges the value of general knowledge. Is this wholly consistent with his polemic in favour of “thoroughness”?

† Though he advises that “heuristic” methods be adopted “at the very earliest possible moment” (page 10), a recommendation about which two opinions may be held.
